2D MPI: how many slices?

- C++, so preferably more slices along rows than columns
 - Highest power of 2 that exactly divides np: np & -np
 - Less than sqrt(np): $2^{\lceil \log_2(\sqrt{np}) \rceil}$
- $4 \rightarrow 2*2$ $8 \rightarrow 4*2$ $16 \rightarrow 4*4$
 $10 \rightarrow 5*2$ $20 \rightarrow 5*4$ $22 \rightarrow 11*2$

MPI 2D scalings

Conclusions

- Seemingly communication dominated
 - Computation time: $nr*nc$
 - Communication: $2*(2*nr + 2*nc)$, time ?
- (Not ideal) Might need to tune algorithm to carry out communication across nodes in large chunks
