# Injector: creating bunches of electrons

- Optical laser strikes  $\text{Cs}_2\text{Te}$  surface, releasing a cloud of electrons
- Electrons move into a magnetic field, shaping into a bunch
- Small accelerator module “fires” bunch into the main electron accelerator

# Accelerator: electrons at close to light speed

- 100 accelerator modules over 2 km bring the electron bunch to near light speed and high energies
- Superconducting niobium cavities powered by intense radio frequency accelerate electrons

# First accelerated electron beam in the injector

- **Injector commissioning started**, injector tunnel closed, cool down to 2 K successful.
- **First 130 MeV Electron beam on 18.12.2015!**

## Photon energy ranges

## Hard X-rays

### **SPB: Single Particles, Clusters, and Biomolecules**

- Will determine the structure of single particles, such as atomic clusters, viruses, and biomolecules

### **MID: Materials Imaging and Dynamics**

- Will be able to image and analyze nano-sized devices and materials used in engineering

### **FXE: Femtosecond X-Ray Experiments**

- Will investigate chemical reactions at the atomic scale in short time scales—molecular movies

### **HED: High Energy Density Physics**

- Will look into some of the most extreme states of matter in the universe, such as the conditions at the center of planets

## Soft X-rays

### **SQS: Small Quantum Systems**

- Will examine the quantum mechanical properties of atoms and molecules.

### **SCS: Spectroscopy and Coherent Scattering**

- Will determine the structure and properties of large, complex molecules and nano-sized structures.

## General Soft X-Ray radiation parameters

Pulse widths	2 – 100 fs	Coherence time	0.3 – 1.8 fs
Pulse energy	0.2 – 11.0 mJ	Bandwidth	0.25 – 0.7 %
Peak power	50 – 120 GW	Number of photons	0.1 – 2 x 10 <sup>14</sup>
Average power	3 – 300 W	Average flux of photons	0.3 – 5.4 x 10 <sup>18</sup>
Beam size	40 – 80 μm	Average brilliance	0.03 – 2.6 x 10 <sup>24</sup>
Rep. rate	10 Hz (2700 pulses in bunch train) = 27.000 pulses/s		

Parameter	Unit					
Bunch charge	pC	20	100	250	500	1000
Pulse duration (FWHM)	fs	2	9	23	43	107

dynamics

Time scale: 10 fs - 1  $\mu$ s, reversible processes are preferable

# Pump-probe experiments at XFELs

# Challenge I: Vacuum space-charge effects

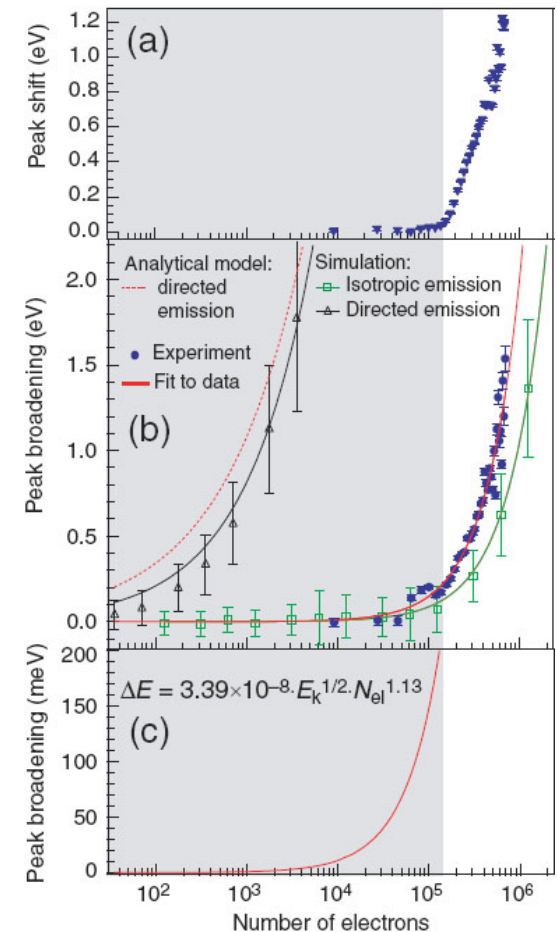

## Core-level X-ray photoemission spectroscopy (XPS)

84

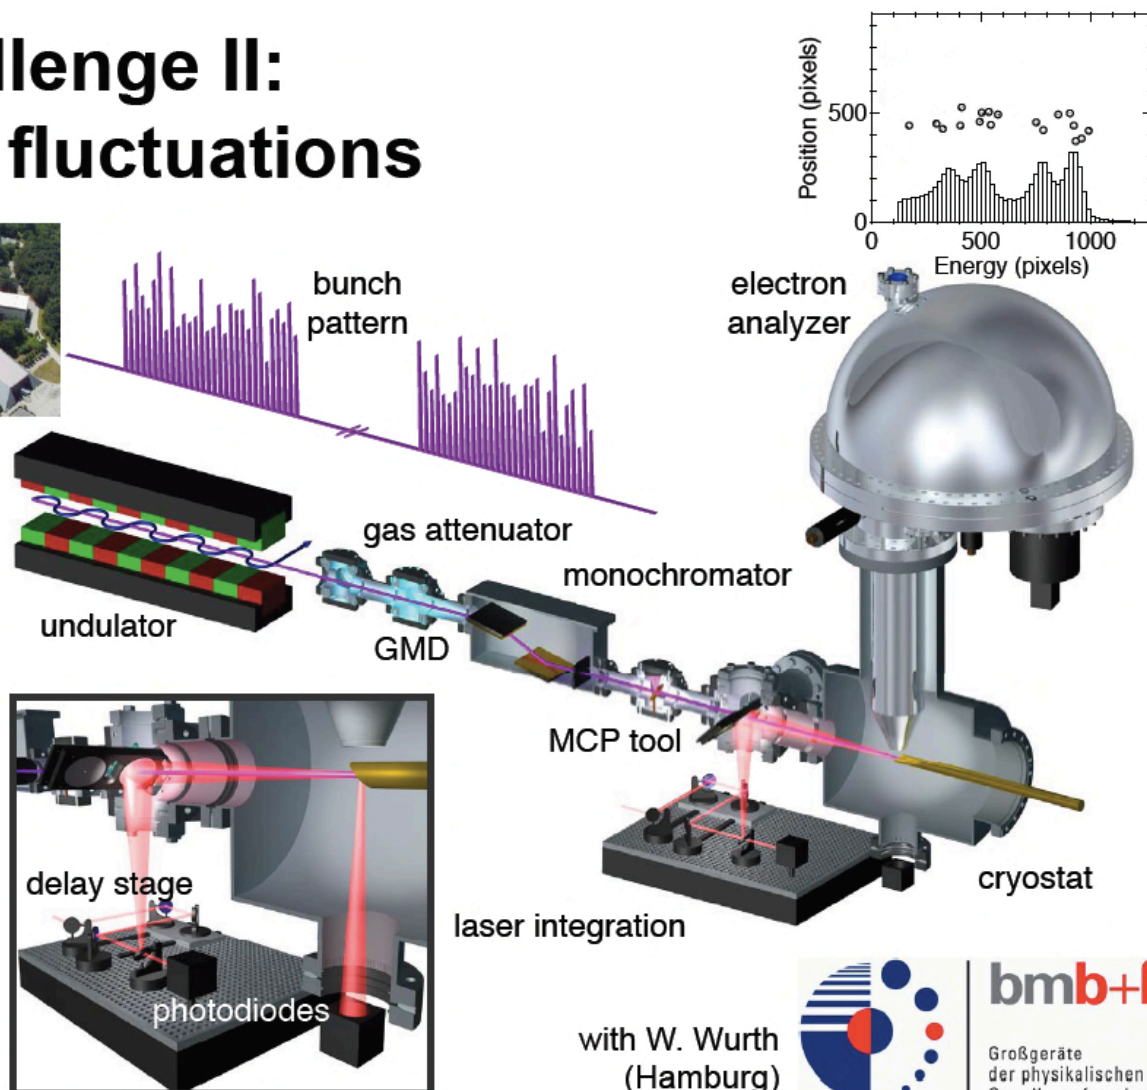

Core-level PE was proven to be extremely useful tool for time-resolved studies of, e.g. chemical interactions at FLASH and LCLS (W. Wurth, L. Kipp, A. Nilsson).

space charge (1mm spot)  
> 10<sup>8</sup> phot/pulse  
> 10<sup>4</sup> el/pulse

# Challenge II: FEL fluctuations

NJP 14, 013062  
(2012)

with W. Wurth  
(Hamburg)

**bmb+f**  
Großgeräte  
der physikalischen  
Grundlagenforschung

## Challenge III: Low FEL repetition rates

Angle imaging + TOF spectroscopy + multi-hit detection

Space-charge limit:  $I_0 \approx 10^4 \frac{e^-}{\text{pulse}}$

Energy window:  $\frac{\Delta E}{E} \approx 0.01$

Angular acceptance:  $\frac{\Delta \Omega}{2\pi} \approx 0.034$

Electron counts per photon pulse:

$$I_0 \times \frac{\Delta E}{E} \times \frac{\Delta \Omega}{2\pi} \approx 3.4 \frac{e^-}{\text{pulse}}$$

1 *T*-TaSe<sub>2</sub>: trXPS using FLASH

87

PRL **105**, 187401 (2010) $T = 10 \text{ K}$  $h\nu_{\text{pump}} = 1.55 \text{ eV}$ .  $h\nu_{\text{probe}} = 156 \text{ eV}$  $\Delta E \approx 300 \text{ meV}$ .  $\Delta t \approx 700 \text{ fs}$  $F = 1.8 \text{ mJ/cm}^2$ 

# Angle-resolved photoemission (ARPES)

In contrast, angle(spín)-resolved photoemission (ARPES) that for crystalline species is the only tool providing direct information on

- single-particle excitations (simple *s*- and *p*-like systems) and
- electron interactions (correlated *d*- and *f*-systems)

is not straightforward at the existing  
low repetition rate FELs!

**Reason:** too less “allowed” excited electrons per second to acquire reasonable statistics

**\*Note:** ARPES signal is 100-1000 lower than XPS one

# ARPES at XFELs with low repetition rate

89

What you get at  
non-superconducting  
XFEL facilities  
(60 - 100 Hz rep. rate)

# Why angle-resolved photoemission?

On the other hand, particularly temperature dependent electron dynamics that causes transitions between

superconducting, magnetic and  
Kondo (heavy fermion) properties

in correlated systems is dreamed to be studied, since it allows

- understanding of underlying mechanisms of the phenomena
- switching from one behavior to another
- engineering of novel materials with well-defined properties

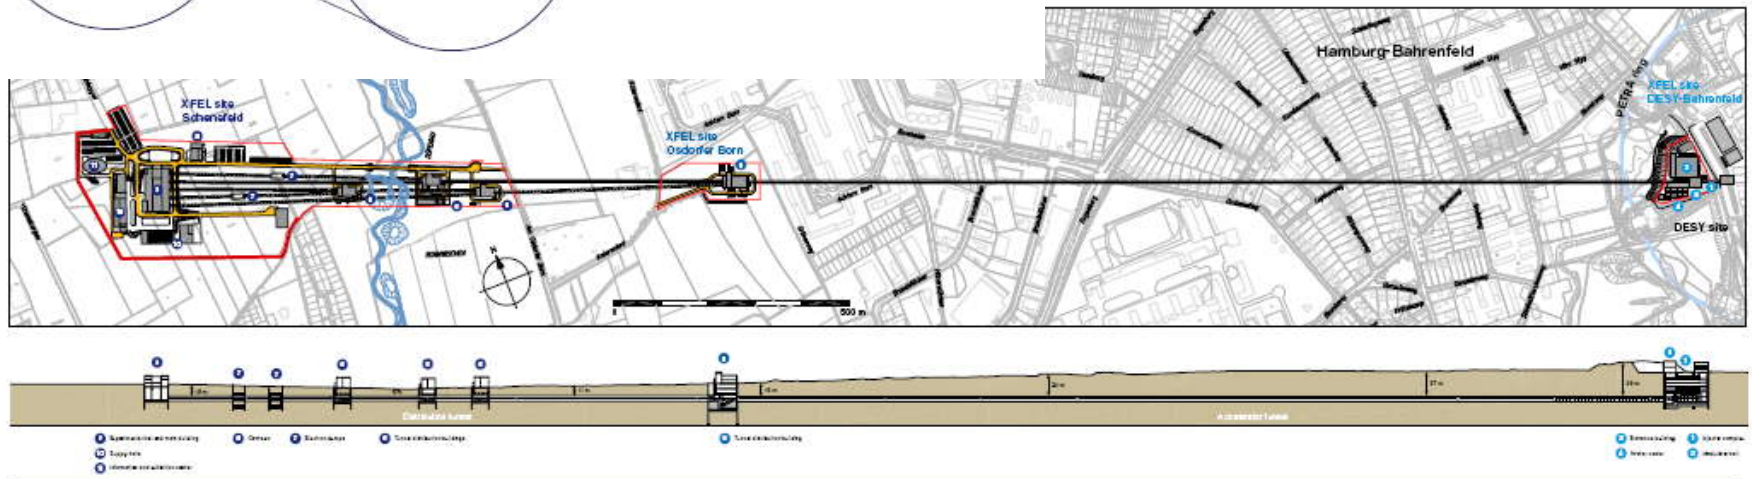

# European XFEL: Time structure

## Electron bunch trains

(with up to 2700 bunches à 1 nC)

Superconducting LINAC technology provides 27.000 light pulses/s in burst-like structure. It makes XFEL.EU attractive for photon-hungry experiments.

**What you get at  
non-superconducting  
XFEL facilities  
(60 - 100 Hz rep. rate)**

**Due to unique rep. rate  
photoemission response  
at the European XFEL is  
about  $10^3$  higher (statistics)  
→ strong case for ARPES:**

- two-color exp. (unfilled states)
- pump-probe (electron dynamics)
