

### Square Root - Direct Method

In IEEE floating point standard a real number is represented as :

$$(-1)^S \times M \times 2^E$$

In 32-bit representation :

$$S \in \{0, 1\}$$

$$M \in [1, 2[$$

$$E \in \{-126, \dots, 127\}$$

$$\text{Or } M \in [0, 2[$$

$$\text{if } E = -127$$

*normal*

*sub-normal*

### Square Root - Direct Method

To help the calculation of  $\sqrt{R}$

the representation of  $R$  must be changed into

$$R = (-1)^S \times M' \times 2^{2E'} \quad \text{where } S = 0$$

$$E' = \text{Int}(E/2)$$

$$M' \in [0, 4[$$

Then  $\sqrt{R} = (-1)^S \times \sqrt{M'} \times 2^{E'}$  with  $\sqrt{M'} \in [0, 2[$

Square Root

February 2017

### Square Root - Direct Method

Let  $R$  be a positive real number ( $S = 0$ )  $R = (-1)^S \times M \times 2^E$

We seek to calculate the positive real number  $\sqrt{R}$

$$\sqrt{R} = (-1)^S \times \sqrt{M} \times 2^{E/2}$$

$\frac{E}{2}$  is easy to calculate ... except when  $E$  is **odd**

Square Root

February 2017

### Square Root - Direct Method

However, when  $M' \in [0, 1[$  the calculation of  $\sqrt{M'}$  may lead to a lost of precision

Therefore if  $M' = 0$   $\sqrt{M'} = 0$

and if  $M' \in ]0, 1[$   $E'$  is decreased and  $M'$  is  $\times 2$  until it can fit within  $[1, 4[$

### Square Root - Direct Method

Then, the problem can be stated as :

Given a positive real number  $A \in [1, 4[$   
 we seek to calculate  $X_{Th}$  such as  $X_{Th} = \sqrt{A}$   $X_{Th} \in [1, 2[$

Let  $X_n$  be an approximation of  $X_{Th}$  coded on  $n+1$  bits

$$X_n = \sum_{j=0}^n x_{-j} \times 2^{-j} \quad \text{such as } X_n^2 \leq A < (X_n + 2^{-n})^2$$

We propose to calculate  $X_n$  digit-by-digit

Square Root

February 2017

### Square Root - Direct Method

$$\text{Let } X_k = \sum_{j=0}^k x_{-j} \times 2^{-j} \quad \text{such as } X_k^2 \leq A < (X_k + 2^{-k})^2$$

At each iteration  $X_k$  is obtained from  $X_{k-1}$

$$X_k = X_{k-1} + x_{-k} 2^{-k} \quad x_{-k} \in \{0, 1\}$$

$2^{-k}$  is denoted  $W_k$

Square Root

February 2017

### Square Root - Direct Method

$$\text{Let } X_{k-1} = \sum_{j=0}^{k-1} x_{-j} \times 2^{-j} \quad \text{such as } X_{k-1}^2 \leq A < (X_{k-1} + 2^{-(k-1)})^2$$

Square Root

February 2017

### Square Root - Direct Method

$$X_k^2 \leq A < (X_k + 2^{-k})^2$$

$$0 \leq A - X_k^2 < (X_k + 2^{-k})^2 - X_k^2 \quad \text{Let } \Delta_k = A - X_k^2$$

$$0 \leq \Delta_k < 2^{-k}(2X_k + 2^{-k})^2 \quad \text{yet } X_k < 2$$

$$\text{and } X_k + 2^{-k} \leq 2$$

$$\text{then } 0 \leq \Delta_k < 4 \times 2^{-k}$$

- $0 \leq \Delta_0 < 4$
- At each iteration the upper bound of  $\Delta_k$  is divided by 2

Square Root

February 2017

### Square Root - Direct Method

$$\Delta_k = A - X_k^2$$

$$\Delta_k = A - (X_{k-1} + x_{-k}2^{-k})^2$$

$$\Delta_k = A - (X_{k-1}^2 + 2x_{-k}2^{-k}X_{k-1} + x_{-k}^22^{-2k})$$

$$\Delta_k = \Delta_{k-1} - x_{-k}2^{-k}(2X_{k-1} + 2^{-k})$$

$$2^k \Delta_k = 2^k \Delta_{k-1} - x_{-k}(2X_{k-1} + 2^{-k}) \quad \text{Let } D_k = 2^k \Delta_k$$

$$D_k = 2D_{k-1} - x_{-k}(2X_{k-1} + 2^{-k}) \quad x_{-k} = \begin{cases} 0 & \text{such as } 0 \leq D_k \\ 1 & \end{cases}$$

Square Root

February 2017

### Square Root - Direct Method

#### Implementation

$$D_k = 2(D_{k-1} - x_{-k}(X_{k-1} + 2^{-2k}W_{k-1}))$$

$$X_k = X_{k-1} + x_{-k}2^{-1}W_{k-1}$$

$$W_k = 2^{-k} = 2^{-1}W_{k-1}$$

Square Root

February 2017

### Square Root - Direct Method

$$D_k = 2D_{k-1} - x_{-k}(2X_{k-1} + 2^{-k}) \quad x_{-k} = \begin{cases} 0 & \text{such as } 0 \leq D_k \\ 1 & \end{cases}$$

Iteration scheme :

$$\begin{cases} D_k = 2(D_{k-1} - x_{-k}(X_{k-1} + 2^{-k-1})) \\ X_k = X_{k-1} + x_{-k}2^{-k} \end{cases} \quad x_{-k} = \begin{cases} 0 & \text{such as } 0 \leq D_k \\ 1 & \end{cases}$$
