Spectral functions and spin textures on metallic surfaces imaged by spin-ARPES

news & views

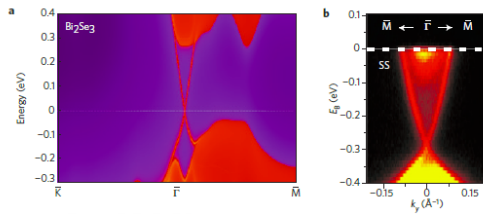

TEN YEARS OF NATURE PHYSICS

Not trivial to realize

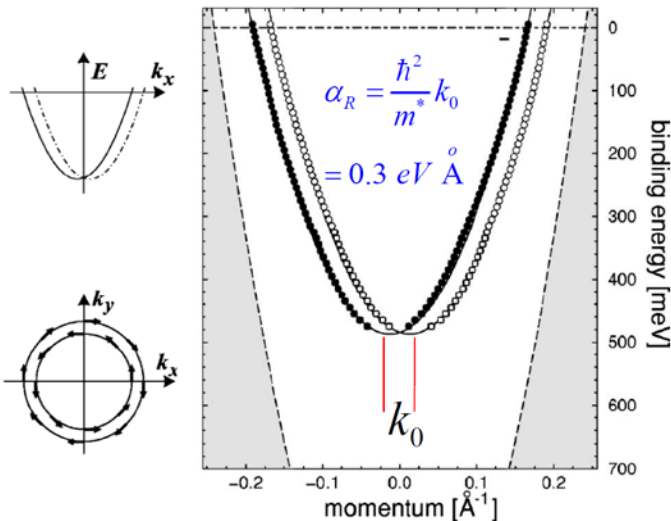

In 2009, two papers provided the first unambiguous examples of three-dimensional topological insulators — bulk insulators boasting metallic surface states with massless Dirac electrons. These now form just one of many classes of topological materials.

Joel E. Moore

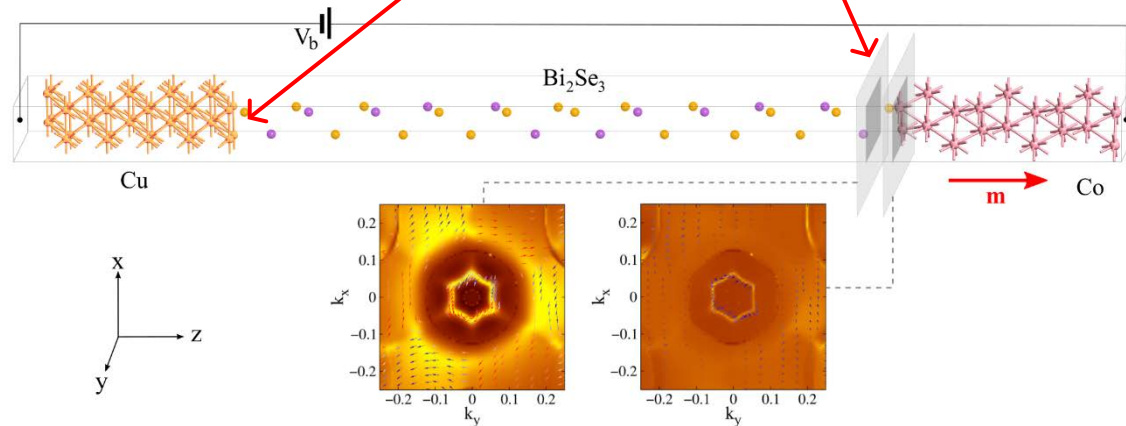

An alternately compelling and frustrating fact about condensed-matter physics is that it takes place in actual materials. However beautiful a theoretical concept may be in the abstract, its ultimate appeal is limited until a material is found to realize it. Of course, condensed-matter physicists are not the only ones who live under the tyranny of the periodic table; nuclear physics and its interactions with society might have a much different history, for example, if either fewer or more isotopes could

Crash Course on Spin-Orbit Coupling (SOC) in Vacuum

FORMALLY:

On the v^2/c^2 expansion of the Dirac equation with external potentials

Wlodek Zawadzki^(a)
Institute of Physics, Polish Academy of Sciences, Al. Lotników 32/46, 02-668 Warsaw, Poland

(Received 13 January 2005; accepted 8 April 2005)

The v^2/c^2 expansion of the Dirac equation with external potentials is reexamined. A complete, gauge invariant form of the expansion to order $(1/c)^2$ is established that contains two additional terms, in contrast to various published results. It is shown that the additional terms describe the relativistic decrease of the electron spin magnetic moment with increasing electron energy. © 2005

Spin-Transfer and Spin-Orbit Torques from Nonequilibrium Green Functions (NEGF)

□ Fundamental quantities of NEGF formalism:

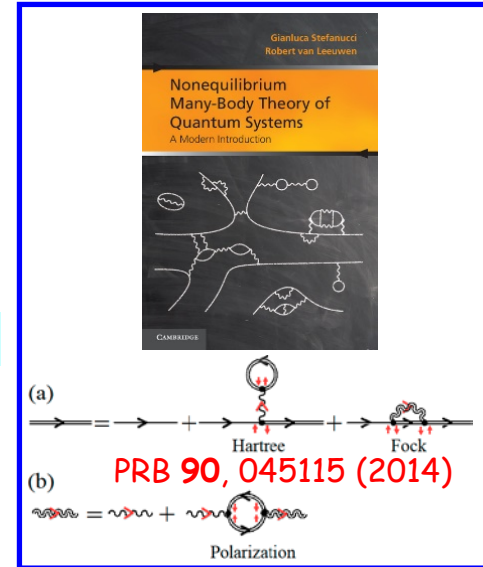

density of available quantum states:

$$G_{\sigma\sigma'}^r(t, t') = -\frac{i}{\hbar} \Theta(t - t') \langle \{ \hat{c}_{\mathbf{r}\sigma}(t), \hat{c}_{\mathbf{r}'\sigma'}^\dagger(t') \} \rangle$$

how are those states occupied:

$$G_{\sigma\sigma'}^<(t, t') = \frac{i}{\hbar} \langle \hat{c}_{\mathbf{r}'\sigma'}^\dagger(t') \hat{c}_{\mathbf{r}\sigma}(t) \rangle$$

Learn more about NEGF from:

□ NEGFs for steady-state transport:

$$G^r(t, t') \rightarrow G^r(t - t') \xrightarrow{\text{FT}} G^r(E)$$

$$G^<(t, t') \rightarrow G^<(t - t') \xrightarrow{\text{FT}} G^<(E)$$

$$\hat{\rho}_{\text{eq}} = \sum_n f(E_n) |E_n\rangle \langle E_n| = -\frac{1}{\pi} \int_{-\infty}^{+\infty} dE \text{Im} G^r(E) f(E)$$

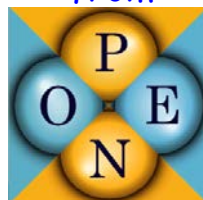

$$\hat{\rho}_{\text{neq}} = \frac{1}{2\pi i} \int_{-\infty}^{+\infty} dE G^<(E)$$

□ NEGF-based expression for spin-transfer torque:

$$\begin{aligned} \hat{H}_{\text{ncDFT}} &= -\frac{\hbar^2 \nabla^2}{2m} + V_{\text{Hartree}}(\mathbf{r}) + V_{\text{XC}}(\mathbf{r}) + V_{\text{ext}}(\mathbf{r}) - \hat{\boldsymbol{\sigma}} \cdot \mathbf{B}_{\text{XC}} \rightarrow \hat{\mathbf{T}} = \frac{d\hat{\mathbf{s}}}{dt} = \frac{1}{2i} [\hat{\boldsymbol{\sigma}}, \hat{H}_{\text{ncDFT}}] \\ \mathbf{T}_{\text{CD}} &= \text{Tr}[(\hat{\rho}_{\text{neq}} - \hat{\rho}_{\text{eq}}) \hat{\mathbf{T}}_{\text{CD}}] \Leftrightarrow \mathbf{T}_{\text{CD}} = \int d^3r \mathbf{s}_{\text{CD}}(\mathbf{r}) \times \mathbf{B}_{\text{XC}}(\mathbf{r}) \\ \mathbf{s}_{\text{CD}}(\mathbf{r}) &= \text{Tr}_{\text{spin}}[(\hat{\rho}_{\text{neq}} - \hat{\rho}_{\text{eq}}) \hat{\boldsymbol{\sigma}}] \end{aligned}$$

most general torque formula valid in the presence of SOC and other spin-nonconserving processes

Nature **511**, 449 (2014)

Table 1 | Comparison of room-temperature $\sigma_{s,\parallel}$ and $\theta_{s,\parallel}$ for Bi_2Se_3 with other materials

Parameter	Bi_2Se_3 (this work)	Pt (ref. 4)	β -Ta (ref. 6)	Cu(Bi) (ref. 23)	β -W (ref. 24)
θ_{\parallel}	2.0–3.5	0.08	0.15	0.24	0.3
$\sigma_{s,\parallel}$	1.1–2.0	3.4	0.8	—	1.8

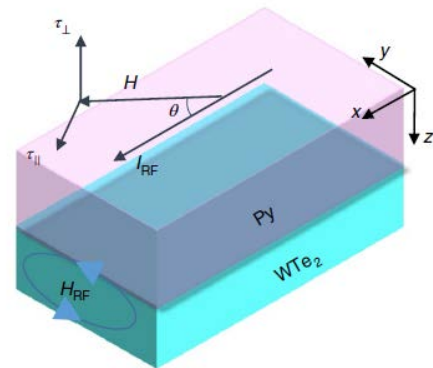

θ_{\parallel} is dimensionless and the units for $\sigma_{s,\parallel}$ are $10^5 \hbar / 2e \Omega^{-1} \text{m}^{-1}$.

"Our findings have potential importance for technology, in that the spin torque ratio for Bi_2Se_3 at room temperature is larger than that for any previously measured spin current source material. However, as noted above, for practical applications the specific layer structure of our devices (topological insulator/metallic magnet) does not make good use of this high intrinsic efficiency because most of the applied current is shunted through the metallic magnet and does not contribute to spin current generation within the topological insulator. Applications will probably require coupling topological insulators to insulating (or high-resistivity) magnets so that the majority of the current will flow in the topological insulator."

one would miss later developments
