**INTERNATIONAL WORKSHOP ON PROTEOMICS:
PROTEIN STRUCTURE, FUNCTION AND INTERACTIONS**
(5 - 16 May 2003)

"Muscles, a complex network essential for life"

presented by:

A. Pastore
National Institute for Medical Research, London
United Kingdom

Muscles, a complex protein network essential for life

**Molecular recognition
and EF-hands**

Trieste 2003

*EMBO Workshop on
NMR and Molecular Recognition*

Ravello 3–7 October 2001

Nuclear Magnetic Resonance

Studies in solution

No need for crystals

Dynamic behaviour

Excellent for weak complexes

High magnetic fields...

From hands...

Interactions...

...EF-hands

A calcium-binding motif

EF-hands

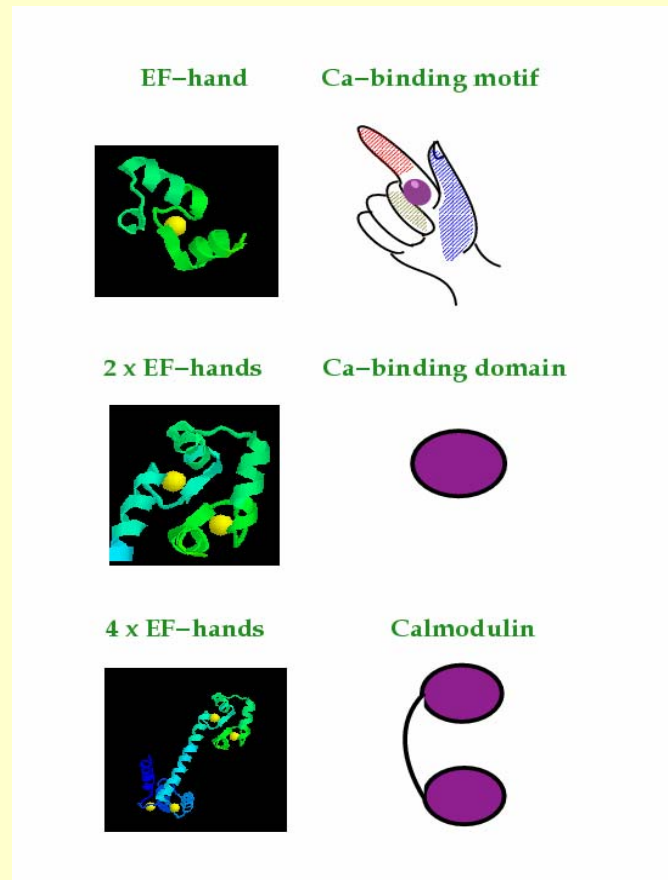

Helix-Loop-Helix motifs

D-x-[DNS]-{#}-[DENSTG]-[DNQGRK]-{GP}-[LIVMC]-
[DENQSTAGC]-x(2)-[DE]-{#}

Hierarchical assembly

In the presence of Calcium...

Semi-open conformations

The semi-open conformation
has been observed
only in complex of EF-hands
with IQ motifs

$IQ_{xx}IRG_{xxx}R_{xx}FY$

scallop myosin

ELC and RLC are
calcium insensitive

A three component system

In the presence of peptides **calmodulin** changes conformation, exposes its hydrophobic groups and wraps around the ligand

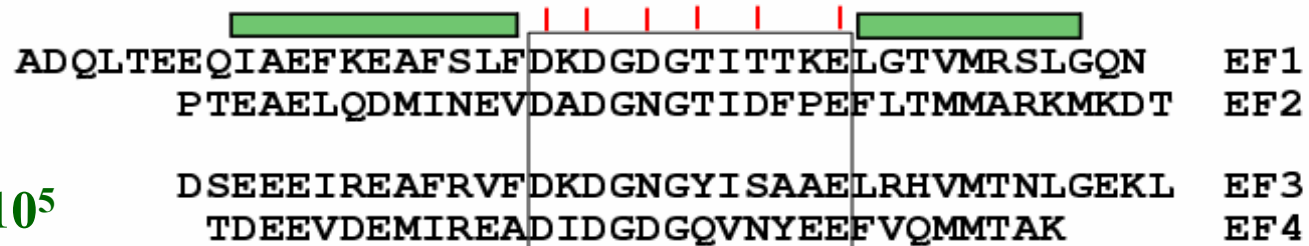

Despite the sequence similarity...

Peptide recognition involves two anchoring points

In the presence of peptides **calmodulin** changes conformation, exposes its hydrophobic groups and wraps around the ligand

Questions 2

Can we predict whether a sequence will bind or not from first principles?

Can we predict the affinities?

Comparison of representative EF-hand complexes

Questions 3

Why all complexes involve the C-terminal domain?

What determines the peptide direction?

Close, open and semi-open EF-hands

EF-hand domains can adopt a large repertoire of conformations (closed, open and semi-open).

EF-hands are mostly involved in protein/protein interactions

Question 4

What determines an open, semi-open or close conformation?

Divergent EF-hands...

+Ca²⁺

-Ca²⁺

calcium insensitive EF-hands

How do they interact?

How are they regulated?

Some EF-hands have diverged through evolution

```

...but they have a hydrophobic region

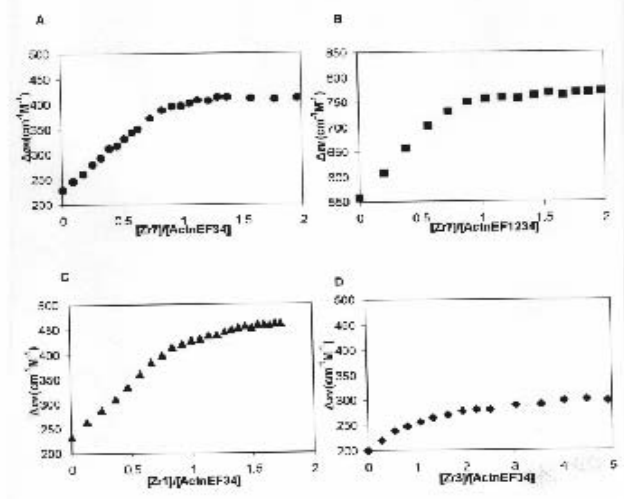

Questions 5

How does a calcium insensitive EF-hand interact with a non-IQ motif?

**Which conformation adopt the EF-hand?
And the peptide?**

Affinities and stoichiometries were compared
by CD and calorimetry studies

Zr1 Zr2 Zr3 Zr4 Zr5 Zr6 Zr7

Summary of the binding affinity data:

1:1 stoichiometries for all complexes

Act-EF34 seems to contain most of
the high affinity sites

We solved the structure of Act-EF34/Zr7

Structure of Zr7 in the complex

Zr7 is unstructured when isolated

~~~~~  
KVGVGKKA~~EAVATVVA~~VDQARVREPREPGHLEESYAQQTTLEYGYKER  
~~~~~

In the complex, Zr7 is **helical** from 8–25.

It remains unstructured from 26 to the end.

The structure of Act-EF34/Zr7

Close, semi-open or open conformation?

Semi-open

— RLC
— act-EF34

Comparison with scallop myosin RLC

scallop myosin and actinin

A state induced by the target recognition?

Semi-open conformations in Ca^{2+} -independent binding

Conclusions

- the C-terminal EF-hand domain of actinin forms stable complexes with some but not all titin Z-repeats
- the Act-EF34/Zr7 complex provides a paradigm for calcium independent target recognition by EF-hands
- calcium-independent binding induces a semi-open conformation

Despite their diversities, EF-hand recognition shares some basic features
