**Exercises on Pattern Recognition** 

## I. WRITTEN EXERCISES

## 1.1 ONE-DIMENSIONAL DISTRIBUTIONS

Consider a function x varying in interval  $[x_0, x_T]$ . Two sets of values of x are given: one for objects of the first class (**D**-objects) and another for objects of the second class (**N**-objects). Is this function useful for the discrimination between D and N? To answer this question, one may compare the distributions (histograms) of the values of x for **D**- and **N**-objects. Here distribution is a table of numbers  $n_i$ , where  $n_i$  is the number of values of x from the interval  $(x_0 + (i-1)\Delta x, x_0 + i\Delta x]$ , i = 0, 1, ..., L, and  $\Delta x$  is a numerical parameter.

Exercise 1: The values of two functions P1 and P2 for 10 **D**-objects and for 10 **N**-objects are given in Table 1. Find  $n_i$  for these functions separately for **D**- and **N**-objects. Let  $x_0$  be equal to the minimal observed value of a function, for both **D**- and **N**-objects, and take  $\Delta P_1 = 1$  and  $\Delta P_2 = 10$ .

TABLE 1

	P1	P2
D1	5.8	81
D2	7.4	112
D3	8.6	93
D4	8.5	108
D5	6.6	154
D6	9.3	97
D7	7.4	112
D8	6.7	103
D9	4.1	132
D10	7.2	100

	P1	P2
N1	6.3	98
N2	2.2	82
N3	2.9	129
N4	5.8	104
N5	1.4	71
N6	3.3	68
N7	4.5	82
N8	0.6	65
N9	3.2	77
N10	2.7	96

## 1.2 INFORMATIVE FUNCTIONS

Consider two distributions of values of the same function x: one distribution for **D**- and another for **N**-objects. Function x is informative for discrimination between **D**- and **N**-objects if the difference between these distributions is sufficiently large.

Let us denote:  $P_x(\varepsilon, \Delta) = (1 - \varepsilon)n_D(\Delta)/n_D - \varepsilon n_N(\Delta)/n_N$ . Here  $n_D(\Delta)/n_D$  and  $n_N(\Delta)/n_N$  are empirical cumulative distribution functions of x for  $\mathbf{D}$ - and  $\mathbf{N}$ -objects. In other words,  $n_D$  is the total number  $\mathbf{D}$ -objects, for which the values of x are determined,  $n_D(\Delta)$  is the number of these objects having  $x > \Delta$ ;  $n_N$  and  $n_N(\Delta)$  are the corresponding numbers for  $\mathbf{N}$ -objects. The value of  $\Delta$  varies within the same limits as x, and  $0 \le \varepsilon \le 1$  determines the relative costs of failure to predict and false alarm ( $\varepsilon = 1/2$ , if the costs are equal).

How informative is x may be characterized by the maximal difference between these distribution functions,  $\max_{\Delta} |P_x(1/2,\Delta)|$ . Function x is the more informative, the nearer the absolute value of  $P_x(1/2,\Delta)$  is to 1/2 at some suitable value of  $\Delta$ .

**Exercise 2:** For x = P1 and P2 from Table 1, find  $P_x(1/2, \Delta)$  at  $\Delta = 7$  and 99, respectively.

*Exercise 3:* For the same functions find which  $\Delta$  maximizes  $|P_x(1/2,\Delta)|$ . Which function (P1 or P2) is more informative judging by  $\max_{\lambda} |P_x(1/2,\Delta)|$ ?

**Exercise 4:** For P1 find the value  $\Delta(\varepsilon)$  maximizing  $|P_x(\varepsilon,\Delta)|$ : a)  $\varepsilon = 0.25$ , b)  $\varepsilon = 0.75$ .

**Exercise 5:** Make the previous **Exercise 4** for P2.

## **1.3 DISCRETIZATION**

The used learning samples of the first and second classes and the set of the objects which are not used in the learning will be denote by  $D_0$ ,  $N_0$ , and X respectively.

The values of each function x lie within certain range  $(x_0, x_T)$ . We divide this range into k intervals by points  $x_i$ , i = 1, 2, ..., k-1. The value of x belongs to the i-th interval if  $x_{i-1} < x \le x_i$ .

$$x_0 \quad x_1 \quad x_2 \qquad x_{k-1} \quad x_k = x_T$$

In a process of discretization we substitute the exact value of the function by the interval, which contains this value. Usually we divide the range into two intervals ("large" and "small" values) or into three intervals ("large", "medium" and "small" values). Our purpose is to find such intervals where moments of one class occur more often than moments of another class.

**Objective** (automatic) discretization: Each interval has about equal number of all the objects together (or of the moments from  $D_0$  and  $N_0$  together).

**Exercise 6:** The values of two functions, f and g, are given in the Table 2 below. They are observed on  $D_0$ ,  $N_0$  and X. Find the intervals for objective discretization. For f take k = 3 and all objects. For g take k = 2 and objects from  $D_0$  and  $N_0$  only.

TABLE 2

# of	Class of	Values of	functions	
moment	of moment	f	g	
1	$D_0$	0.	2	
2	$D_0$	17.5	3	
3	$N_0$	50.	2	
4	X	35.	3	
5	$N_0$	0.	2	
6	X	0.	2	
7	$D_0$	15.	2	
8	$D_0$	25.	3	
9	$N_0$	0.	2	
10	$D_0$	0.	4	
11	X	15.	2	
12	X	24.	2	
13	X	27.5	2	
14	$N_0$	30.	2	
15	$N_0$	0.	3	

How informative is the function in a given discretization can be characterized as follows.

1. Denote  $P_i^D$  to be the number of objects from  $D_0$  within the *i*-th interval of x, in percentage of total number of objects in  $D_0$ , and  $P_i^N$  to be the similar number for objects from  $N_0$ .

Let 
$$P_{\text{max}} = \max_{1 \le i \le k} \left| P_i^D - P_i^N \right|$$
.

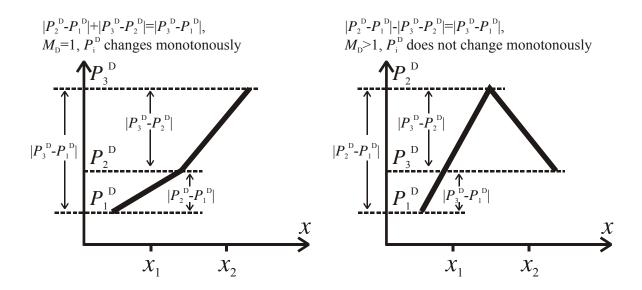

In other words,  $P_i^D$  and  $P_i^N$  are empirical histograms of the value of function for objects from  $D_0$  and  $N_0$ ;  $P_{\text{max}}$  is the maximal difference of these histograms.

The larger is  $P_{\text{max}}$ , the more informative is the function. Functions for which  $P_{\text{max}} < 10\%$  are usually excluded.

2. Let  $k_i = 3$ . Let us denote:

$$M_{D} = \frac{\left| P_{2}^{D} - P_{1}^{D} \right| + \left| P_{3}^{D} - P_{2}^{D} \right|}{\left| P_{3}^{D} - P_{1}^{D} \right|}, \ M_{N} = \frac{\left| P_{2}^{N} - P_{1}^{N} \right| + \left| P_{3}^{N} - P_{2}^{N} \right|}{\left| P_{3}^{N} - P_{1}^{N} \right|}.$$

If  $P_i^D$  changes monotonously with *i*, then  $M_D = 1$ ; the larger is  $M_D$ , more jerky is  $P_i^D$ . This is clear from the figures below. Similar statements are true for  $M_N$ ,  $P_i^N$ .

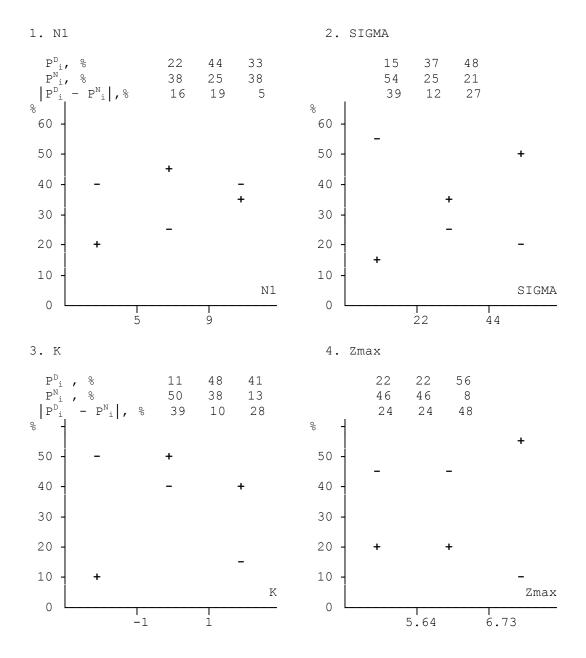

The smaller are  $M_D$  and  $M_N$ , the better is the discretization of the function x. Functions with both  $M_D$ ,  $M_N \ge 3$  are usually excluded.

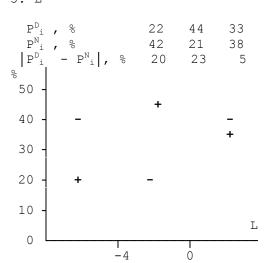

3. Samples  $D_0$  and  $N_0$  are often marginally small, so that their observed difference may be random. Therefore the relation between functions  $P_i^D$  and  $P_i^N$  after discretization should be not absurd from considered problem point of view, though they may be unexpected indeed.

**Exercise 7:** Count  $P_i^D$  and  $P_i^N$  for functions f and g from the Table 2 above. For f take k = 3,  $f_1 = 5$ ,  $f_2 = 30$ ; for g take k = 2,  $g_1 = 2$ .

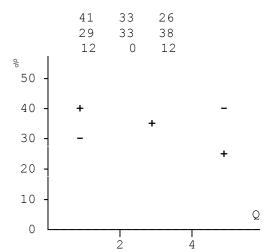

*Exercise* 8: Figure below shows the values of  $P_i^D$  and  $P_i^N$  for seven functions. Arrange these functions in order of decreasing information, which they carry. What functions would you like to exclude?

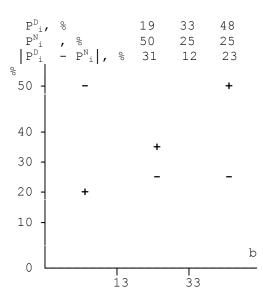

5. L

6. Q

7. Bmax

## **1.4 CODING**

The value of the function belongs to the *l*-th interval, if  $x_{l-1} < x \le x_l$ . In this case two ways of coding are the following:

$$i = 1 \ 2 \dots l-1 \ l \ l+1 \dots k-1 \ k$$
**I**-coding  $0 \ 0 \dots 0 \ 1 \ 0 \dots 0 \ 0$  (k digits),
**S**-coding  $0 \ 0 \dots 0 \ 1 \ 1 \dots 1$  (k-1 digits).

The coding correspond to simple answers to the following questions about the value of x:

*I* - coding: Does *x* belong to 
$$x_{l-1} < x \le x_l$$
? (1 - yes, 0 - no), *S* - coding: Is  $x \le x_l$ ? (1 - yes, 0 - no).

Exercise 9: The following Table shows the values of three functions: a, b, c.

# of object	Values of functions				
	а	b	c		
1	-10	3	2.5		
2	5	7	-4		
3	-2	6	-3		
4	0	17	10		
5	4	2	1		

Discretization should be made as follows:

Function	k	$x_{l}$
a	2	0.5
$\boldsymbol{b}$	3	4.5, 10
c	3	0, 5

Write the code of each object:

- 1) with I-coding for function a, S-coding for functions b and c;
- 2) with S-coding for a, I-coding for b and S-coding for c.

## 1.5 DEFINITION OF THE TRAIT IN ALGORITHM CORA-3

The trait is represented by the 3\*2 matrix

$$\mathbf{A} = \begin{vmatrix} i_1 & i_2 & i_3 \\ \delta_1 & \delta_2 & \delta_3 \end{vmatrix}$$

where  $i_1$ ,  $i_2$ ,  $i_3$ , are integers,  $1 \le i_1 \le i_2 \le i_3 \le L$ , L is the length of the binary code of the objects,  $\delta_j$  is 0 or 1.

Object, which is the binary vector  $\omega^i = (\omega_1^i, \omega_2^i, ..., \omega_L^i)$ , has the trait **A** if

$$\omega_{i_1}^i = \delta_1, \quad \omega_{i_2}^i = \delta_2, \quad \omega_{i_3}^i = \delta_3.$$

For example if an object has the trait

$$\mathbf{A} = \begin{bmatrix} 1 & 3 & 4 \\ 0 & 1 & 0 \end{bmatrix}$$

then it means that the first and the fourth digits in the code of the object are 0 and the third digit is 1, and if an object has the trait

$$\mathbf{A} = \begin{bmatrix} 2 & 2 & 2 \\ 0 & 0 & 0 \end{bmatrix}$$

then it means that the second digit in the code of the object is 0.

Exercise 10: Consider objects (0 1 0 1 1) and (1 1 0 1 1). Find, whether they have the trait

$$\mathbf{A} = \begin{bmatrix} 1 & 2 & 4 \\ 0 & 1 & 1 \end{bmatrix}$$

\_\_\_\_\_

## 1.6. CHARACTERISTIC TRAITS

Denote by  $K(D_0, \mathbf{A})$  the number of objects of the set  $D_0$ , which have the trait  $\mathbf{A}$ , and by  $K(N_0, \mathbf{A})$  the number of objects of set  $N_0$ , which have the trait  $\mathbf{A}$ .

The trait **A** is a characteristic trait of class *D* if

$$K(D_0, \mathbf{A}) \ge k_1$$
 and  $K(N_0, \mathbf{A}) \le \overline{k}_1$ .

The trait A is a characteristic trait of class N if

$$K(N_0, \mathbf{A}) \ge k_2$$
 and  $K(D_0, \mathbf{A}) \le \overline{k}_2$ .

Here  $k_1$ ,  $k_2$ ,  $\bar{k}_1$ , and  $\bar{k}_2$  are parameters of the algorithm. Characteristic traits of the first and second classes are also called *D*-traits and *N*-traits respectively.

Exercise 11: Given are the objects of two learning set:

Set $D_0$	Set $N_0$
1 1 1 0	0010
0 1 1 0	0 1 1 1
1 1 1 1	$0\ 0\ 0\ 0$
1 1 0 0	0001
1 1 0 1	0100
	1000

Find all *D*- and *N*-traits for  $k_1 = 3$ ,  $\overline{k}_1 = 1$ ,  $k_2 = 3$ , and  $\overline{k}_2 = 0$ .

## 1.7 EQUIVALENT AND WEAKER TRAITS

Consider two *D*-traits.

Denote:

 $S_1$  is the subset of objects of set  $D_0$ , which have the first trait,

 $S_2$  is the subset of objects of set  $D_0$ , which have the second trait.

The traits are *equivalent* if  $S_1$  and  $S_2$  coincide. The first trait is *weaker* than the second if  $S_1$  is a strict subset of  $S_2$ . Definition of equivalent and weaker traits for *N*-traits is similar but  $D_0$  is replaced by  $N_0$ .

*Exercise 12:* Consider all characteristic traits obtained in *Exercise 11* from Section 1.6. Eliminate all weaker traits. Leave only one trait from each group of equivalent traits.

\_\_\_\_\_

## 1.7 CHARACTERISTIC TRAITS FOR SUBCLASSES (ALGORITHM "CLUSTERS")

In some problems the learning set  $D_0$  consists of subclasses and it is known that in each subclass there is at least one object of the first class. Other objects of subclasses may belong to the second class. In this case the algorithm **CLUSTERS**, which is the modification of the algorithm **CORA-3** is applied.

Characteristic traits of the first class are defined in the algorithm **CLUSTERS** as follows. A subclass has a trait if some object from it has this trait. Denote by  $K^{S}(D_{0}, \mathbf{A})$  the number of subclasses, which have the trait  $\mathbf{A}$ .  $\mathbf{A}$  is a characteristic trait of the first class (D-trait) if

$$K^{\mathrm{S}}(D_0, \mathbf{A}) \geq k_1$$
 and  $K(N_0, \mathbf{A}) \leq \overline{k}_1$ .

The definition of characteristic traits of the second class in the algorithm **CLUSTERS** is the same as in the algorithm **CORA-3** (see Section 1.6).

*Exercise 13:* Let objects of set  $D_0$  given in Exercise 11 of Section 1.6 be divided into subclasses as follows.

Find subclasses, which have the following traits:

$$\mathbf{A} = \begin{bmatrix} 1 & 1 & 4 \\ 0 & 0 & 0 \end{bmatrix} \ , \qquad \mathbf{B} = \begin{bmatrix} 2 & 3 & 4 \\ 1 & 0 & 0 \end{bmatrix} \ .$$

*Exercise 14:* Take the set  $D_0$  given above and the set  $N_0$  from *Exercise 11* of Section 1.6 and find all D-traits for  $k_1 = 2$ ,  $\bar{k}_1 = 1$ .

## 1.9 EQUIVALENT AND WEAKER TRAITS FOR SUBCLASSES (ALGORITHM CLUSTERS)

Consider two *D*-traits.

Denote:

 $S_1$  as the set of subclasses, which has the first trait,

 $S_2^{\rm s}$  is the set of subclasses, which has the second trait.

The traits are S-equivalent if  $S_1^s$  and  $S_2^s$  coincide. The first trait is S-weaker than the second if  $S_1^s$  is a strict subset of  $S_2^s$ .

**Exercise 15:** Consider all characteristic traits from **Exercise 14** of Section 1.7. Eliminate all S-weaker traits. Leave only one trait from each group of S-equivalent traits.

## 1.10 VOTING AND RECOGNITION

Each object has some number  $n_D$  of *D*-traits and some number  $n_N$  of *N*-traits. The object is recognized as:

the object of the first class (*D*-object) if  $n_D - n_N \ge \Delta$ ,

the object of the second class (*N*-object) if  $n_D - n_N \le \Delta$ .

Here  $\Delta$  is a parameter of the algorithm.

Exercise 16: Consider the characteristic traits left in Exercise 12 of Section 1.7 after elimination of equivalent and weaker ones. Divide the objects from Exercise 11 of Section 1.6 into classes D and N assuming  $\Delta = 0$ .

**Note:** It may be more reliable to assign to N only the object with  $n_D - n_N \le \Delta - \delta$ , and to leave unassigned the objects with  $\Delta > n_D - n_N > \Delta - \delta$ .

## 1.11 HAMMING ALGORITHM: KERNEL OF THE FIRST CLASS

## Determination of the kernel

Each object is a binary vector, as in previous exercises. Kernel is a binary vector of the same length; each component of this vector is "typical" for the first class. To define the kernel two values  $\alpha_1(i)$  and  $\alpha_2(i)$  are calculated for each used component (*i* is the number of the component)

$$\alpha_1(i) = \frac{n_1(i)+1}{N_1+2}, \ \alpha_2(i) = \frac{n_2(i)+1}{N_2+2}.$$

Here  $N_1$  is the number of objects used in the learning sample of the first class,  $n_1(i)$  is the number of those of them, which possess 1 in the *i*-th component;  $N_2$  and  $n_2(i)$  are similar numbers for the learning sample of the second class. The kernel is the vector  $\mathbf{k} = (k_1, k_2, ..., k_L)$ , where

$$k_i = \begin{cases} 1, & \text{if } \alpha_1(i) \ge \alpha_2(i) \\ 0, & \text{if } \alpha_1(i) < \alpha_2(i) \end{cases}$$

*L* is the number of used components.

*Exercise 17:* Find the kernel for the following learning material:

Set $D_0$	Set $N_0$
0 1 1 0 1	10110
10010	1 1 0 0 1
0 1 0 0 1	10100
0 1 0 1 1	$0\ 0\ 0\ 0\ 0$
	10000

**Note:** It may be more reliable to eliminate the components, for which  $|\alpha_1(i) - \alpha_2(i)| < \varepsilon$ , where  $\varepsilon$  is a small constant.

## 1.12 HAMMING ALGORITHM: VOTING AND RECOGNITION

Hamming's distance from an object to the kernel of class D is

$$r = \sum_{i=1}^{L} w_i |\omega_i - k_i|.$$

Here  $w_i$  are the weights of components.

An object is recognized as an object of the first class (*D*-object), if  $r \le R$  or as an object of the second class (*N*-object), if r > R.

*Exercise 18:* Compute the Hamming's distance between the kernel and all objects from *Exercise 16* of Section 1.11 with all  $w_i$ = 1.

Find the minimal value of R, which will assign to the first class all objects of the learning sample  $D_0$ . With this R divide the objects of the learning sample  $N_0$  into D- and N-objects.

## II. ANSWERS FOR WRITTEN EXERCISES

### Exercise 1:

**P**1

i	0	1	2	3	4	5	6	7	8	9
D		-	-	-	-	1	-	2	4	2 1
N		1	1	1	4	1	-	2	-	
$x_0 + (i-1)\Delta x$	-0.4	0.6	1.6	2.6	3.6	4.6	5.6	6.6	7.6	8.6

P2

i	0	1	2	3	4	5	6	7	8	9
D		-	-	1	1	3	3	-	1	- 1
N		1	2	3	-	3	-	-	1	
$x_0 + (i-1)\Delta x$	55	65	75	85	95	105	115	125	135	145

**Exercise 2:** For x = P1  $P_x(1/2, 7) = 0.3$ . For x = P2  $P_x(1/2, 99) = 0.25$ .

**Exercise 3:** For  $x = P1 \max |P_x(1/2, \Delta)| = 0.4$  at  $6.3 \le \Delta < 6.6$ .

For x = P2  $\max_{x \in S} |P_x(1/2, \Delta)| = 0.25$  at  $82 \le \Delta < 93$  or  $96 \le \Delta < 97$  or  $98 \le \Delta < 100$ .

P1 is more informative.

**Exercise 4:** For P1: a)  $3.3 \le \Delta(0.25) < 4.1$ ; b)  $6.3 \le \Delta(0.75) < 6.6$ 

**Exercise 5:** For P2: a)  $77 \le \Delta(0.25) < 81$ ; b)  $104 \le \Delta(0.75) < 108$  or  $129 \le \Delta(0.75) < 132$ .

**Exercise 6:** For  $f: f_1 = 0$ ,  $24 \le f_2 < 25$ ; for  $g: 2 \le g_1 < 3$ .

**Exercise 7:** For  $f: P_1^D = 40\%$ ,  $P_2^D = 60\%$ ,  $P_3^D = 0\%$ ,  $P_1^N = 60\%$ ,  $P_2^N = 20\%$ ,  $P_3^N = 20\%$ ; for  $g: P_1^D = 40\%$ ,  $P_2^D = 60\%$ ,  $P_1^N = 80\%$ ,  $P_2^N = 20\%$ .

Exercise 8: Zmax, SIGMA, K, Bmax, L, N1, Q. It is reasonable to exclude functions L, N1, Q.

Exercise 10: (0 1 0 1 1) has, (1 1 0 1 1) has not.

## Exercise 11:

$$D\text{-traits:} \, \left\| \begin{array}{c} 1 \ 1 \ 1 \\ 1 \ 1 \ 1 \\ \end{array} \right\| \, , \, \, \left\| \begin{array}{c} 1 \ 1 \ 2 \\ 1 \ 1 \ 1 \\ \end{array} \right\| \, , \, \, \left\| \begin{array}{c} 2 \ 2 \ 3 \\ 1 \ 1 \ 1 \\ \end{array} \right\| \, , \, \, \left\| \begin{array}{c} 2 \ 2 \ 4 \\ 1 \ 1 \ 0 \\ \end{array} \right\| \, , \, \, \left\| \begin{array}{c} 2 \ 3 \ 3 \\ 1 \ 1 \ 1 \\ \end{array} \right\| \, , \, \, \left\| \begin{array}{c} 2 \ 4 \ 4 \\ 1 \ 0 \ 0 \\ \end{array} \right\| \, , \, \left\| \begin{array}{c} 2 \ 3 \ 3 \\ 1 \ 1 \ 1 \\ \end{array} \right\| \, , \, \left\| \begin{array}{c} 2 \ 4 \ 4 \\ 1 \ 0 \ 0 \\ \end{array} \right\| \, , \, \left\| \begin{array}{c} 2 \ 3 \ 3 \\ 1 \ 1 \ 1 \\ \end{array} \right\| \, , \, \left\| \begin{array}{c} 2 \ 4 \ 4 \\ 1 \ 0 \ 0 \\ \end{array} \right\| \, , \, \left\| \begin{array}{c} 2 \ 4 \ 4 \\ 1 \ 0 \ 0 \\ \end{array} \right\| \, , \, \left\| \begin{array}{c} 2 \ 3 \ 3 \\ 1 \ 1 \ 1 \\ \end{array} \right\| \, , \, \left\| \begin{array}{c} 2 \ 4 \ 4 \\ 1 \ 0 \ 0 \\ \end{array} \right\| \, , \, \left\| \begin{array}{c} 2 \ 4 \ 4 \\ 1 \ 0 \ 0 \\ \end{array} \right\| \, , \, \left\| \begin{array}{c} 2 \ 3 \ 3 \\ 1 \ 1 \ 1 \\ \end{array} \right\| \, , \, \left\| \begin{array}{c} 2 \ 4 \ 4 \\ 1 \ 0 \ 0 \\ \end{array} \right\| \, , \, \left\| \begin{array}{c} 2 \ 4 \ 4 \\ 1 \ 0 \ 0 \\ \end{array} \right\| \, , \, \left\| \begin{array}{c} 2 \ 3 \ 3 \\ \end{array} \right\| \, , \, \left\| \begin{array}{c} 2 \ 4 \ 4 \\ 1 \ 0 \ 0 \\ \end{array} \right| \, , \, \left\| \begin{array}{c} 2 \ 4 \ 4 \\ 1 \ 0 \ 0 \\ \end{array} \right| \, , \, \left\| \begin{array}{c} 2 \ 4 \ 4 \\ 1 \ 0 \ 0 \\ \end{array} \right| \, , \, \left\| \begin{array}{c} 2 \ 4 \ 4 \\ 1 \ 0 \ 0 \\ \end{array} \right| \, , \, \left\| \begin{array}{c} 2 \ 4 \ 4 \\ 1 \ 0 \ 0 \\ \end{array} \right| \, , \, \left\| \begin{array}{c} 2 \ 4 \ 4 \\ 1 \ 0 \ 0 \\ \end{array} \right| \, , \, \left\| \begin{array}{c} 2 \ 4 \ 4 \\ 1 \ 0 \ 0 \\ \end{array} \right| \, , \, \left\| \begin{array}{c} 2 \ 4 \ 4 \\ 1 \ 0 \ 0 \\ \end{array} \right| \, , \, \left\| \begin{array}{c} 2 \ 4 \ 4 \\ 1 \ 0 \ 0 \\ \end{array} \right| \, , \, \left\| \begin{array}{c} 2 \ 4 \ 4 \\ 1 \ 0 \ 0 \\ \end{array} \right| \, , \, \left\| \begin{array}{c} 2 \ 4 \ 4 \\ 1 \ 0 \ 0 \\ \end{array} \right| \, , \, \left\| \begin{array}{c} 2 \ 4 \ 4 \\ 1 \ 0 \ 0 \\ \end{array} \right| \, , \, \left\| \begin{array}{c} 2 \ 4 \ 4 \\ 1 \ 0 \ 0 \\ \end{array} \right| \, \right| \, , \, \left\| \begin{array}{c} 2 \ 4 \ 4 \\ 1 \ 0 \ 0 \\ \end{array} \right| \, , \, \left\| \begin{array}{c} 2 \ 4 \ 4 \\ 1 \ 0 \ 0 \\ \end{array} \right| \, , \, \left\| \begin{array}{c} 2 \ 4 \ 4 \\ 1 \ 0 \ 0 \\ \end{array} \right| \, , \, \left\| \begin{array}{c} 2 \ 4 \ 4 \\ 1 \ 0 \ 0 \\ \end{aligned} \right| \, , \, \left\| \begin{array}{c} 2 \ 4 \ 4 \\ 1 \ 0 \ 0 \\ \end{aligned} \right| \, , \, \left\| \begin{array}{c} 2 \ 4 \ 4 \\ 1 \ 0 \ 0 \\ \end{aligned} \right| \, , \, \left\| \begin{array}{c} 2 \ 4 \ 4 \\ 1 \ 0 \ 0 \\ \end{aligned} \right| \, , \, \left\| \begin{array}{c} 2 \ 4 \ 4 \\ 1 \ 0 \ 0 \\ \end{aligned} \right| \, , \, \left\| \begin{array}{c} 2 \ 4 \ 4 \\ 1 \ 0 \ 0 \\ \end{aligned} \right| \, , \, \left\| \begin{array}{c} 2 \ 4 \ 4 \\ \end{aligned}| \, \right| \, , \, \left\| \begin{array}{c} 2 \ 4 \ 4 \\ \end{aligned}| \, \right| \, , \, \left\| \begin{array}{c} 2 \ 4 \ 4 \\ \end{aligned}| \, \right| \, , \, \left\| \begin{array}{c} 2 \ 4 \ 4 \\ \end{aligned}| \, \right| \, , \, \left\| \begin{array}{c} 2 \ 4 \ 4 \\ \end{aligned}| \, \right| \, , \, \left\| \begin{array}{c} 2 \ 4 \ 4 \\ \end{aligned}| \, \right| \, \right| \, \right| \, , \, \left\| \begin{array}{c} 2 \ 4 \ 4 \\ \end{aligned}| \, \right| \, \right| \, , \, \left\| \begin{array}{c} 2 \ 4 \ 4 \\ \end{aligned}| \, \right| \, \right| \, \right| \, , \, \left\| \begin{array}{c} 2$$

### Exercise 12:

$$D\text{-traits:} \, \left\| \begin{array}{c|c} 1 & 1 & 1 \\ 1 & 1 & 1 \end{array} \right\| \, \text{ or } \, \left\| \begin{array}{c|c} 1 & 1 & 2 \\ 1 & 1 & 1 \end{array} \right\| \, , \, \left\| \begin{array}{c|c} 2 & 2 & 3 \\ 1 & 1 & 1 \end{array} \right\| \, , \, \left\| \begin{array}{c|c} 2 & 2 & 4 \\ 1 & 1 & 0 \end{array} \right\| \, \text{ or } \, \left\| \begin{array}{c|c} 2 & 4 & 4 \\ 1 & 1 & 0 \end{array} \right\| \,$$

N-traits: 
$$\begin{vmatrix} 1 & 1 & 3 \\ 0 & 0 & 0 \end{vmatrix}$$
 or  $\begin{vmatrix} 1 & 3 & 3 \\ 0 & 0 & 0 \end{vmatrix}$ ,  $\begin{vmatrix} 2 & 2 & 2 \\ 0 & 0 & 0 \end{vmatrix}$ 

### Exercise 13: The 1st subclass has trait A and the 3rd has trait B.

### Exercise 14:

## **Exercise 17:** $\mathbf{k} = (0, 1, 0, 1, 1)$

## Exercise 18:

$$\begin{array}{c} & r \\ D_0 \\ & 2 D \\ 3 D \\ 1 D \\ 0 D \\ N_0 \\ & 4 N \\ 2 D \\ 5 N \\ 3 D \\ 4 N \\ \end{array}$$

## III. COMPUTER EXERCISES WITH THE PROGRAMS CODM AND PRAL

## **EXERCISE 1**

Task: To make and to print table-histograms for functions P1 and P2

## **EXERCISE 2**

Task: To make discretization and to print the obtained histogram for

### **EXERCISE 3**

```
Task: To make discretization and to print the obtained histograms
      for the functions f and g. Compare the obtained histograms
      with the result of Exercise 7 of Section 1.3 of the written
      exercises.
Program to use: CODM.
Input files: profile - EXE2.COD,
             file with values of functions - EXE2.PAT.
Input data: mode of work - discretization,
            number of classes - 3,
            classes of objects from file EXE2.COD,
            print - on,
            do not create output profile,
            thresholds of discretization:
                 for the function f: 5, 30,
                 for the function q: 2.
                                 EXERCISE 5
```

Task: To make discretization for the functions a, b, c and binary coding for the objects (Table from Exercise 9 of Section 1.4 of the written exercises). Print the obtained coding and compare it with the result of Exercise 9. Program to use: CODM. Input files: profile - no, file with values of functions - EXE5.PAT. Input data: mode of work - discretization and coding, number of classes for discretization - 3, number of classes for coding - 3, all objects belong to the third class, type - on, print - on, subclasses - off, create output profile with name EXE5.COD, thresholds of discretization: for the function a: 0.5, for the function b: 4.5, 10, for the function c: 0, 5,methods of coding: for the function a - I, for the function b - S,

for the function c - S.

Task: To make binary coding for the objects (Table from Exercise 9 of Section 1.4 of the written exercises). Print the obtained coding and compare it with the result of Exercise 9. Program to use: CODM. Input files: profile - EXE5.COD, file with values of functions - EXE5.PAT. Input data: mode of work - coding, number of classes for coding - 3, classes of objects from file EXE5.COD, type - on, print - on, subclasses - off, do not create output profile, thresholds of discretization from file EXE5.COD, methods of coding: for the function a - S, for the function b - I, the function c is not coded.

### **EXERCISE 7**

## **EXERCISE 8**

Task: To classify the objects (Table from Exercise 11 of Section 1.6 of the written exercises) with subclasses in the first class (Table from Exercise 13 of Section 1.8 of the written exercises) by using the pattern recognition algorithm CLUSTERS. Compare the result with the results of Exercises 14 and 15 of Sections 1.8 and 1.9 of the written exercises. Program to use: PRAL. Algorithm: CORA-3. Input files: profile - no, file with coding of object - EXE8.RAT. Input data: k1=2, k1t=1, k2=3, k2t=0, all objects and components are used, to print: coding, traits, lattices of traits, table of voting, value of delta - 0, only one variant, no control experiments.

Task: To classify the objects (Table from Exercise 17 of Section 1.11 of the written exercises) by using the pattern recognition algorithm **HAMMING**. Compare the results with the results of Exercises 17 and 18 of Sections 1.11 and 1.12 of the written

exercises. Program to use: PRAL. Algorithm: HAMMING.

Input files: profile - no,

file with coding of object - EXE9.RAT.

Input data: all objects and components are used,

to print: coding, kernel, all weights are equal to 1,

value of delta - 3,

only one variant, no control experiments.

## **EXERCISE 10**

Task: To specify classes for objects of the Adria margin in peninsular Italy and Sicily. Create output profile.

Program to use: CODM.

Input files: profile - no,

file with values of functions - ITALY.PAT.

Input data: mode of work - discretization,

number of classes - 3,

classes of objects should be specified accordingly to the table

given below,

print - on,

output profile - EXE10.COD.

Name	Class

Task: To make discretization and to print the obtained histogram for the functions describing the objects of the Adria margin in peninsular Italy and Sicily using the classes of objects specified in Exercise 10. Create output profile.

Program to use: CODM.

Input files: profile - EXE10.COD,

file with values of functions - ITALY.PAT.

Input data: mode of work - discretization,

number of classes - 3,

classes of objects from file EXE10.COD,

print - on,

output profile - EXE11.COD,

discretization for functions:

DH with thresholds 1500. and 2000.

D2 with thresholds 0. and 50.

Mor with thresholds 2. and 4.

Bmin with thresholds -46. and 7.

DH/L with thresholds 40. and 65.

automatic discretization for function HR with 2 intervals

## **EXERCISE 12**

Task: To make binary coding for the functions describing the objects of the Adria margin in peninsular Italy and Sicily using the classes of objects

specified in Exercise 10 and the thresholds of discretization obtained

Exercise 11. To create a file with the coding and to print the results. Program to use: CODM.

Input files: profile - EXE11.COD,

file with values of functions - ITALY.PAT.

Input data: mode of work - coding,

number of classes - 3,

classes of objects from file EXE11.COD,

subclasses - off

print - on,

file with coding - EXE12.RAT output profile - EXE12.COD,

thresholds of discretization from file EXE11.COD

methods of coding:

S for functions DH, HR, D2, Bmin, and DH/L I for function Mor.

## **EXERCISE 13**

Task: To classify the objects of the Adria margin in peninsular Italy and Sicily

by means the pattern recognition algorithm **CORA-3** using the binary codes obtained in Exercise 12 and the distribution of the objects among classes

specified in Exercise 10.

Program to use:  $\ensuremath{\mathbf{PRAL}}$  .

Algorithm: CORA-3.

Input files: profile - no,

file with coding of object - EXE12.RAT.

Input data: k1=4, k1t=2, k2=13, k2t=0,

all objects and components are used,

to print: traits, voting

value of delta - 0,

only one variant, no control experiments.

## RESULTING PRINTOUTS FOR EXERCISES

### Exercise 10

Input profile - no File with values of functions - ITALY.pat number of objects=146; number of functions=16 Mode: discretization Number of classes for discretization = 3Output profile - exel0.cod objects of class 1 (D0): a\_11, a\_26, a\_27, a\_43, a\_45, a\_51, a\_59, a\_61, a\_70, a\_73, a\_74, a\_84, a\_85, a\_90, a\_92, a\_95, a\_109, a\_112, a\_117, a\_118,  $\overline{a123}$ ,  $\overline{a128}$ ,  $\overline{a129}$ , a144 objects of class 2 (N0): a\_1, a\_2, a\_4, a\_5, a\_6, a\_8, a\_10, a\_12, a\_13, a\_19, al16, al24, al25, al26, al31, al32, al33, al34, al35, al37, al38, al39, al40, al43, al45, al46 objects of class 3 (X): a\_3, a\_7, a\_9, a\_14, a\_15, a\_16, a\_17, a\_18, a\_20, a\_21, a\_22, a\_23, a\_24, a\_25, a\_28, a\_31, a\_32, a\_38, a\_39, a\_41, a\_48, a\_50, a\_52, a\_54, a\_55, a\_58, a\_63, a\_64, a\_65, a\_66, a\_67, a\_68, a\_69, a\_71, a\_78, a\_79, a\_80, a\_82, a\_86, a\_87, a\_87, a\_88, a\_88, a\_87, a\_88, a\_88, a\_88, a\_87, a\_88, a\_8 a\_88, a\_93, a\_97, a100, a103, a106, a113, a119, a120, a121, a122, a127, a130, a136, a141, a142

### Exercise 11

Input profile - EXE10.cod File with values of functions - ITALY.pat number of objects=146; number of functions=16 Mode: discretization Number of classes for discretization = 3Output profile - exell.cod objects of class 1 (D0): a\_11, a\_26, a\_27, a\_43, a\_45, a\_51, a\_59, a\_61, a\_70, a\_73, a\_74, a\_84, a\_85, a\_90, a\_92, a\_95, a109, a112, a117, a118, a123, a128, a129, a144 objects of class 2 (N0): a\_1, a\_2, a\_4, a\_ a\_6, a\_8, a\_10, a\_12, a\_13, a\_19, a\_1, a\_2, a\_4, a\_3, a\_5, a\_6, a\_37, a\_40, a\_42, a\_44, a\_46, a\_47, a\_49, a\_53, a\_56, a\_57, a\_60, a\_62, a\_72, a\_75, a\_76, a\_77, a\_81, a\_83, a\_89, a\_91, a\_94, a\_96, a\_98, a\_99, a\_101, a\_102, a\_104, a\_105, a\_107, a\_108, a\_110, a\_111, a\_114, a\_115, al16, al24, al25, al26, al31, al32, al33, al34, al35, al37, al38, al39, al40, al43, al45, al46 objects of class 3 (X): a\_3, a\_7, a\_9, a\_14, a\_15, a\_16, a\_17, a\_18, a\_20, a\_21, a 22, a 23, a 24, a 25, a 28, a 31, a 32, a 38, a 39, a 41, a 48, a 50, a 52, a 54, a 55, a 58, a 63, a 64, a 65, a 66, a 67, a 68, a 69, a 71, a 78, a 79, a 80, a 82, a 86, a 87, a 88, a 93, a 97, a 100, a 103, a 106, a 113, a 119, a 120, a 121, a122, a127, a130, a136, a141, a142
