

2068-15

#### Advanced School in High Performance and GRID Computing -Concepts and Applications

30 November - 11 December, 2009

Introduction to Linux

R. Johnson University of Pennsylvania Philadelphia USA

# **Introduction to Linux**

**Bob Johnson** 

Institute for Computational Molecular Science Temple University, Philadelphia, USA

### Outline

- Preliminaries
- Basic Commands
- Combining/Redirecting
- Scripts

"Linux is user-friendly. It is not ignorant-friendly or idiot-friendly."

### **Preliminaries – File Organization**

#### **Directory Tree**

### **Preliminaries – The Shell**

	Terminal	_ <b> </b>
<u>F</u> ile <u>E</u> dit <u>V</u> iew <u>T</u> erminal	Ta <u>b</u> s <u>H</u> elp	
[bob@nickel ~]\$ cowsay	-f elephant Hi! This is the shell!	<b>A</b>
< Hi! This is the shell	     >

		~

### **Basic Linux Commands**

#### **Commands:**

- What are they? Just programs in the directory tree
- Where are they located? /bin, /usr/bin, /sbin
- How do I determine how a command works? Manual pages: man command-name
- Anatomy of a command: [DoSomething] [How] [ToFiles/Directories] Is -I /home/bob

## **Basic Linux Commands**

#### **Basic Navigation**

- Is (Is -Itr)
- pwd
- cd

#### **Directory Creation**

- mkdir
- rmdir

#### File Viewing

- more, less
- head, tail
- grep, wc

#### File Manipulation

- cp
- mv
- rm
- gedit
- rename
- cat, paste
- chmod, chgrp, chown

#### **System Information**

- top, ps
- kill
- du, df

### **Controlling Data Flow**

#### Redirection

 Redirect output into a new file: '>' command > filename

 Append output to an existing file: '>>' command >> filename

 Direct file as input for command: '<' command < input\_file</li>

### Piping

 Use output from one command as input for a second: '|' command1 | command2 | command3...

### **Shell Variables**

Store numbers, filenames, strings in variable that's accessible to the shell

#### **Local Variables**

Variable definition: VAR=value

Expand variable: \${VAR}

Print value of variable: echo \${VAR}

**Unset variable: unset VAR** 

#### **Environment Variables**

Create an environment variable: export VAR

**User's home directory: \${HOME}** 

Search path for executables: \${PATH}

### .bashrc File

Behavior of shell environment defined in .bashrc file located in \${HOME}

robertjo@delta:~			
<u>F</u> ile <u>E</u> dit <u>V</u> iew <u>T</u> erminal Ta <u>b</u> s <u>H</u> elp			
# .bashrc		Â	
<pre>PATH=\${PATH}:\${HOME}/programs</pre>			
export PATH			
# Course globel definitions			
# Source global definitions			
/etc/bashrc			
fi			
1			
# User specific aliases and functions			
alias l='ls -ltshr'			
~			
~			
~			
~			
~			
~			
	13.1	A11 -	

### **Shell Scripts**

- A series of commands can be incorporated into a script and executed like a program
- Can be used to automate (repetitive) tasks

#### **Scripting Languages**

- Bash/Csh/Tcsh/Ksh
- SED Replace text
  - Syntax similar to that used in VI
- AWK Manipulate column formatted data

– Syntax similar to C

## **Secure Shell (SSH)**

Transfer data from one computer to another over network

- Connect to remote computer: ssh user@hostname
- Export display of remote computer: ssh -X user@hostname
- Transfer files using SSH scp <files> user@hostname:<directory>

### **AWK Scripts**

Very powerful at manipulating files containing data in columns

Anatomy of an AWK Script

**Example: Computing an average** 

**Example: Manipulating columns** 

**Example: Combine with Linux commands**
