## Manufacturing & analysis

Hannu Häkkinen, Nanoscience Center, University of Jyväskylä

## Cluster sources

- Seeded supersonic nozzle source
- Gas-aggregation source
- Laser vaporization source
- Sputtering source
- Liquid-metal ion source

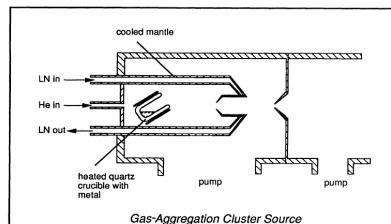

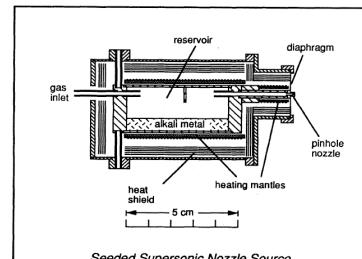

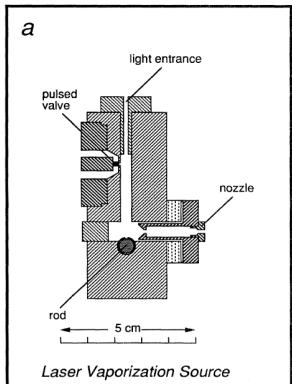

Hannu Häkkinen, Nanoscience Center, University of Jyväskylä

## Cluster sources – overview

- Seeded supersonic nozzle source: intense continuous beams, low-boiling-point materials, evaporative cooling -> structured mass spectra (magic stabilities visible), temperature not well controlled
- Gas-aggregation cluster source: efficient for production of large clusters (up to 20 000+), low intensity, low-to-medium boiling point materials (< 2000 K), low cluster temperature (< 100 K)
- Laser vaporization source: pulsed beams from any material, cluster temperature near the source temperature
- Sputtering source: energetic heavy inert-gas ion sputtering beam (Kr+, Xe+, 10 – 20 keV) -> continuous beam of singly ionized (hot) clusters, cooling by evaporation
- Liquid-metal ion source: singly and multiply ionized (hot) clusters of low-melting point metals

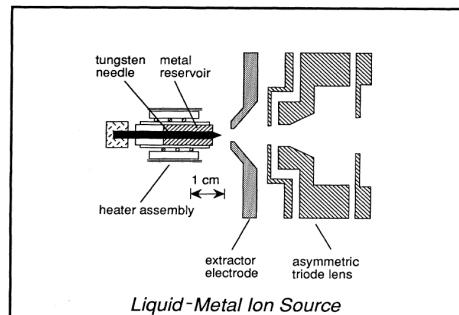

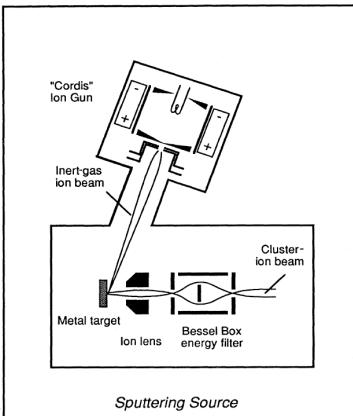

Hannu Häkkinen, Nanoscience Center, University of Jyväskylä

## Cluster sources

Hannu Häkkinen, Nanoscience Center, University of Jyväskylä

## Cluster sources

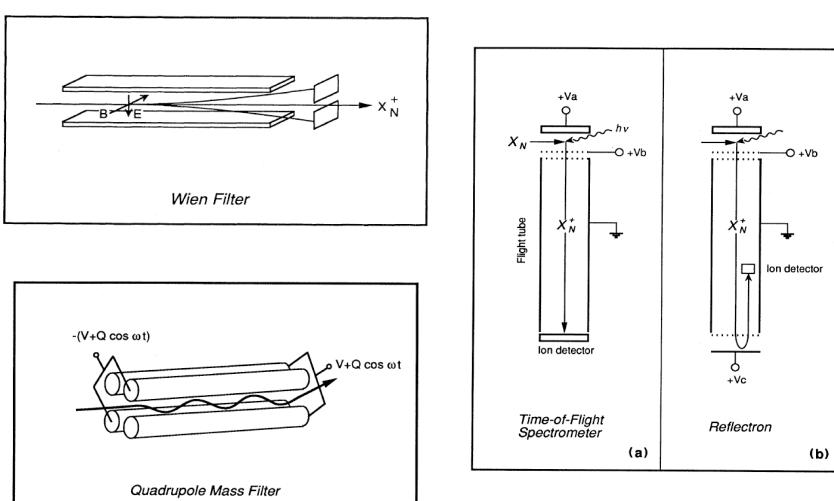

Hannu Häkkinen, Nanoscience Center, University of Jyväskylä

## Analysis techniques

- Wien filter
- Quadrupole mass filter
- Time-of-flight mass spectrometry
- Ion cyclotron resonance mass spectrometry in ion trap
- Molecular-beam mobility analysis
- Electron diffraction in ion trap (structure factor)
- Photoelectron spectroscopy

Hannu Häkkinen, Nanoscience Center, University of Jyväskylä

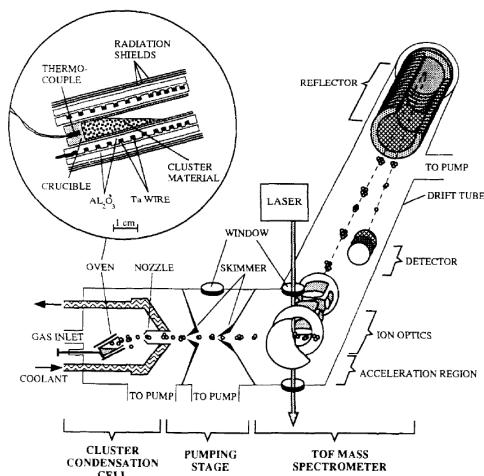

## Cluster mass analysis

Hannu Häkkinen, Nanoscience Center, University of Jyväskylä

## Example of a full setup

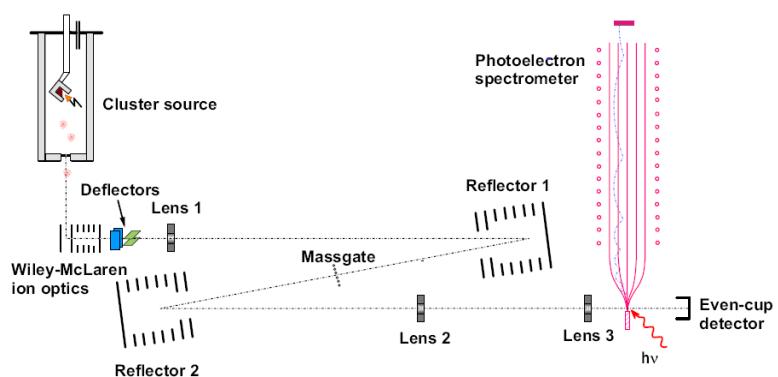

Gas-aggregation source  
Photoionization by laser  
Time-of-flight mass analysis

Martin, Phys. Rep. 273, 199 (1996)

Hannu Häkkinen, Nanoscience Center, University of Jyväskylä

## Photoelectron spectroscopy

O. Kostko, PhD Thesis Freiburg 2007

Hannu Häkkinen, Nanoscience Center, University of Jyväskylä

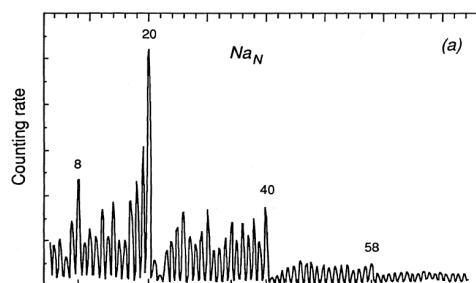

## Cluster stability: atomic and electronic shells

Hannu Häkkinen, Nanoscience Center, University of Jyväskylä

## Cluster stability – "magic numbers"

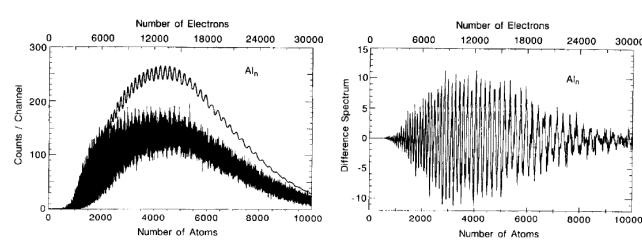

Sodium

Knight et al, Phys. Rev. Lett.  
52, 2141 (1984)

Aluminium

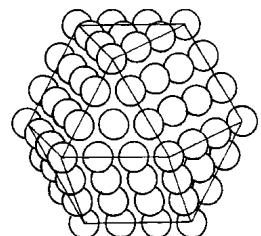

Martin, Phys. Rep.  
273, 199 (1996)

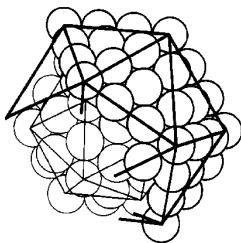

Hannu Häkkinen, Nanoscience Center, University of Jyväskylä

## Cluster stability – atomic shells

Cuboctahedron (fcc)

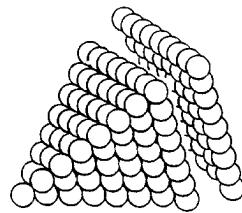

Icosahedron

T.P. Martin  
Physics Reports  
**273**, 199 (1996)

Tetrahedron (fcc)

Hannu Häkkinen, Nanoscience Center, University of Jyväskylä

## Delocalized-electron shell model Spherical clusters

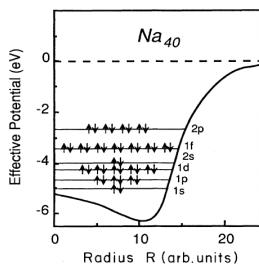

FIG. 3. Self-consistent effective potential of jellium sphere corresponding to  $\text{Na}_{40}$  with the electron occupation of the energy levels. After Chou *et al.*, 1984.

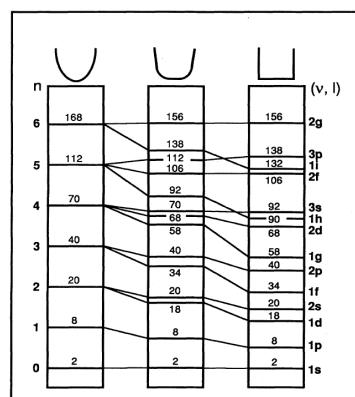

FIG. 2. Energy-level occupations for spherical three-dimensional, harmonic, intermediate, and square-well potentials. After Mayer and Jensen, 1955.

Hannu Häkkinen, Nanoscience Center, University of Jyväskylä

## 3D isotropic anharmonic oscillator

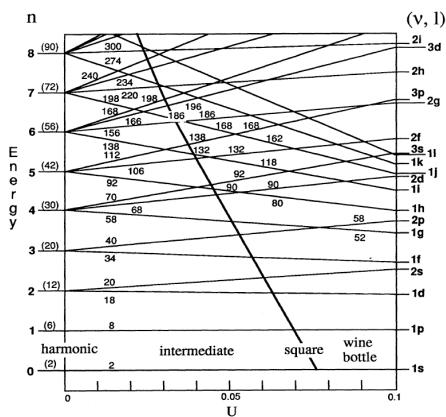

### ■ Single-particle Hamiltonian

$$H = \frac{\mathbf{p}^2}{2m} + \frac{m\omega_0^2 \mathbf{q}^2}{2} - U \hbar \omega_0 [l^2 - n(n+3)/6]$$

$$R_0 = r_s N^{1/3} \quad \hbar \omega_0 = E_F / N^{1/3}$$

### ■ Eigenvalue spectrum

$$E_n = \hbar \omega_0 \left( n + \frac{3}{2} \right) - U [l^2 - n(n+3)/6]$$

Hannu Häkkinen, Nanoscience Center, University of Jyväskylä

## Electron shells - Effect of deformations

- Clemenger (1985) <- Nilsson (nuclear physics, 1955 !) model:  
for a fixed volume, the cluster shape adjusts to minimize the total energy
- Deformation  $\rightarrow$  cluster radii Rx, Ry, Rz  $\rightarrow$  tri-axial oscillator

$$E(n_x, n_y, n_z) = \hbar \omega_0 \left[ (n_x + \frac{1}{2}) \frac{R_0}{R_x} + (n_y + \frac{1}{2}) \frac{R_0}{R_y} + (n_z + \frac{1}{2}) \frac{R_0}{R_z} \right]$$

- Spheroid (Rx = Ry), distortion parameter

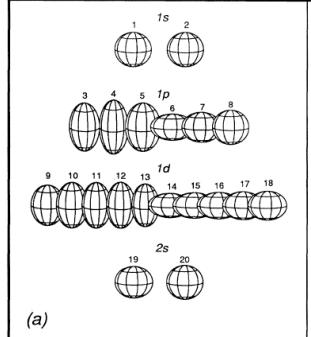

$$\eta = 2 \frac{R_z - R_x}{R_z + R_x}$$

- Total energy for spheroids

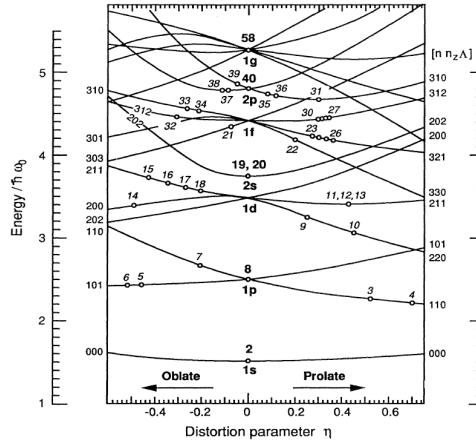

$$E_{\text{tot}}(\eta, N) = \frac{3}{4} \sum E(\eta, n_x, n_y, n_z)$$

Hannu Häkkinen, Nanoscience Center, University of Jyväskylä

## Clemenger – Nilsson diagram

(a)

Hannu Häkkinen, Nanoscience Center, University of Jyväskylä

## Cluster stability – electron shells

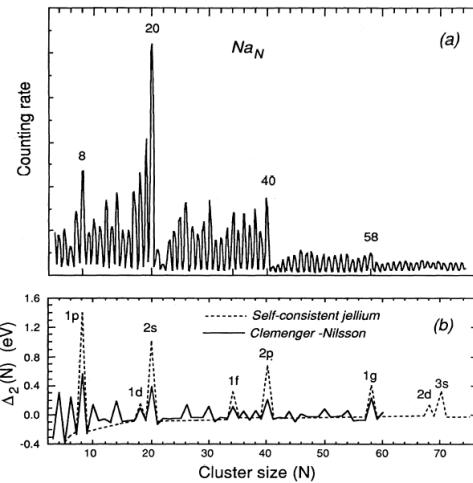

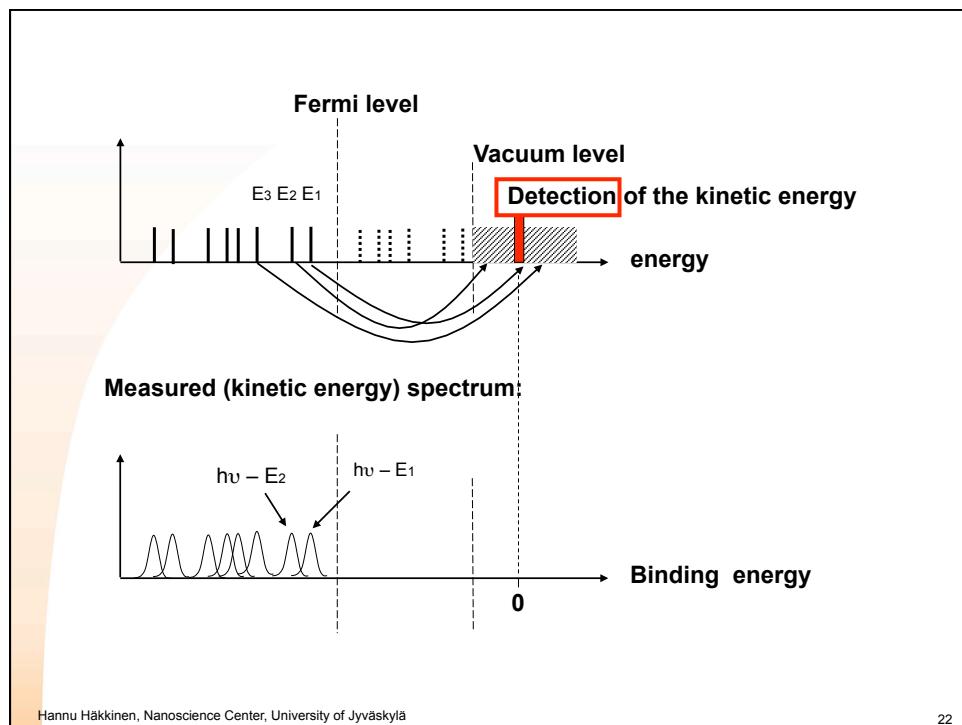

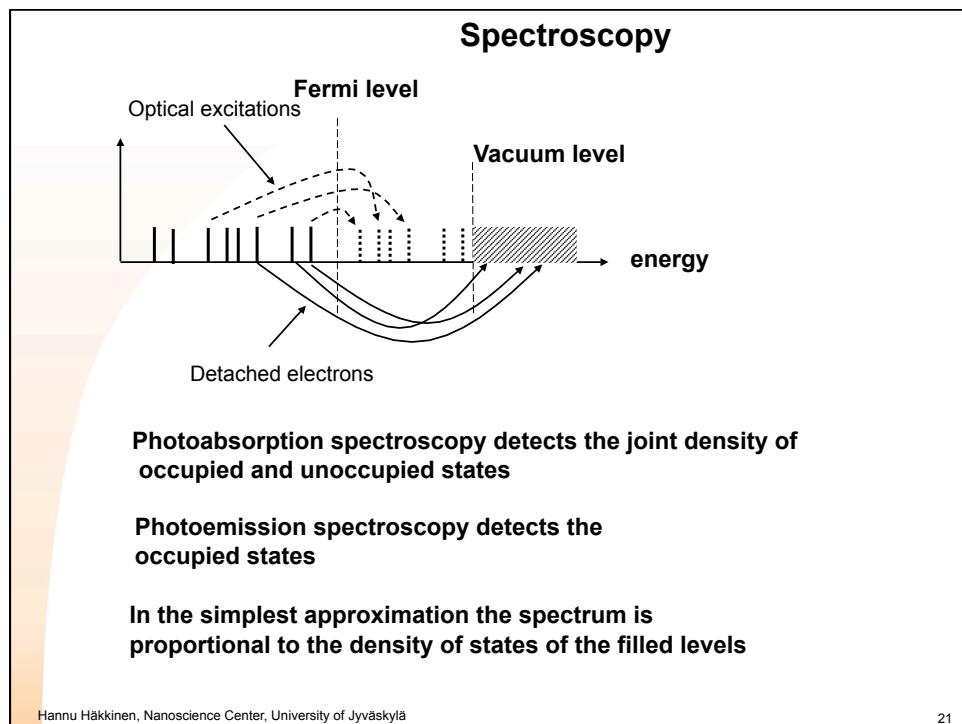

FIG. 1. Sodium cluster abundance spectrum:  
 (a) experimental (after Knight *et al.*, 1984); (b) dashed line, using Woods-Saxon potential  
 (after Knight *et al.*, 1984); solid line, using the  
 ellipsoidal shell (Clemenger-Nilsson) model  
 (after de Heer, Knight, Chou, and Cohen,  
 1987).

W.A. deHeer  
 Rev. Mod. Phys.  
**65**, 611 (1993)

Hannu Häkkinen, Nanoscience Center, University of Jyväskylä

## QUANTUM-SIZE EFFECTS (QSE) IN METALLIC NANOPARTICLES ?

Free-electron model of metal : density of electron states  $D(\epsilon) \propto \sqrt{\epsilon}$

Mean spacing of electron levels at the Fermi level  $\epsilon_F$ :

$$\delta(\epsilon_F) = 1 / D(\epsilon_F) \sim 2 \epsilon_F / 3 N z \quad (N = \text{number of atoms}, z = \text{valence number})$$

QSE observable when  $\delta > kT$  ( $kT = 0.025$  eV at 300 K)

E.g: for Au,  $\epsilon_F = 5.5$  eV,  $z = 1 \rightarrow$

$$\delta > kT \quad \text{when } N < 150 \text{ atoms} \rightarrow \text{diameter} < 1.7 \text{ nm}$$

- QSE  $\rightarrow$  stabilization of the nanoparticle structure by electronic effects
- $\rightarrow$  opening of the energy gap at the Fermi level (HOMO-LUMO gap)
- $\rightarrow$  "metallic"  $\rightarrow$  "semiconductor" behaviour

MACROSCOPIC      MESOSCOPIC      MICROSCOPIC

Metal

Size-Induced Metal-Insulator Transition

Insulator

Diameter:  $D \gg 10^4 \text{ \AA}$   
Nuclearity:  $N \gg 10^{10}$   
Kubo Gap:  $\delta \ll 10^{-6} \text{ K}$

BULK METAL

$D \sim 10^4\text{--}10^2 \text{ \AA}$   
 $N \sim 10^{10}\text{--}10^4$   
 $\delta \sim 10^{-6}\text{--}1 \text{ K}$

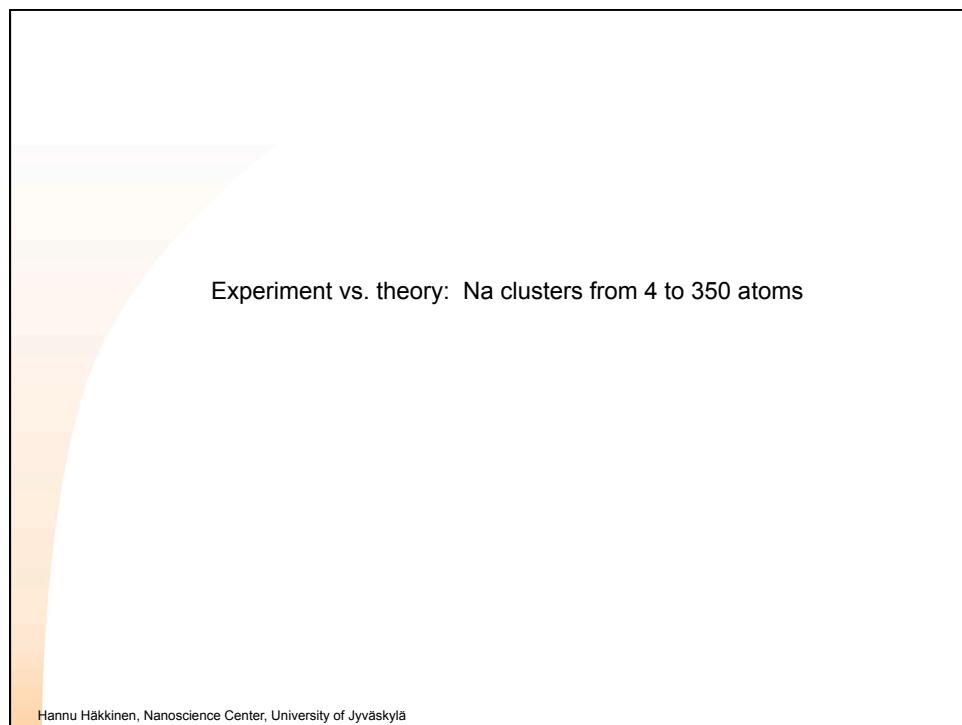

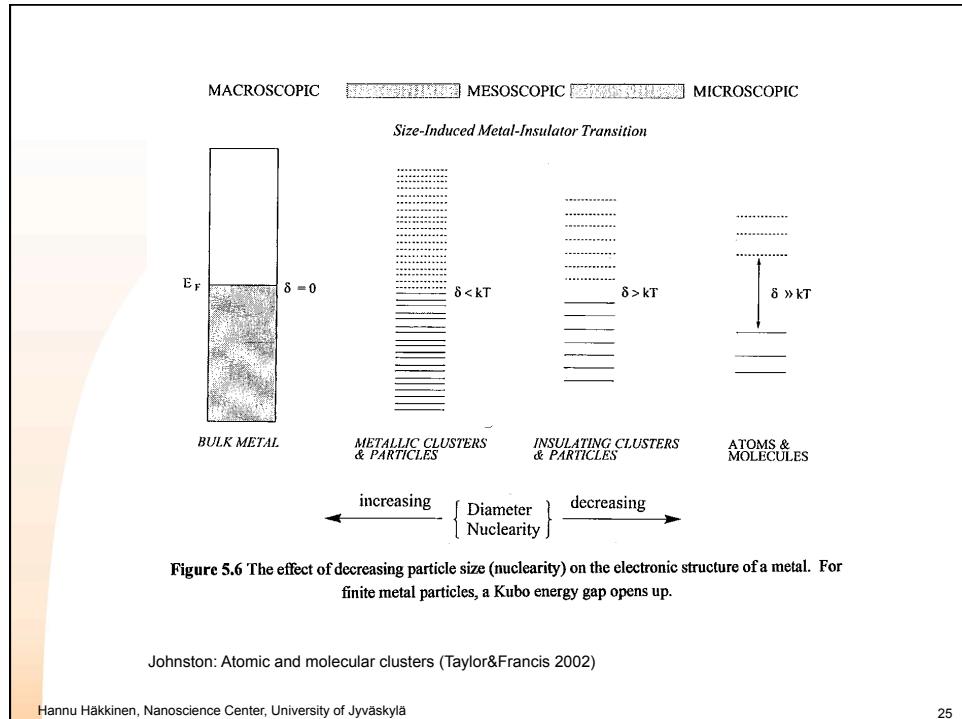

$D \sim 10^2\text{--}10 \text{ \AA}$   
 $N \sim 10^4\text{--}10$   
 $\delta \sim 1\text{--}10^3 \text{ K}$

$D < 10 \text{ \AA}$   
 $N < 10$   
 $\delta > 10^3 \text{ K}$

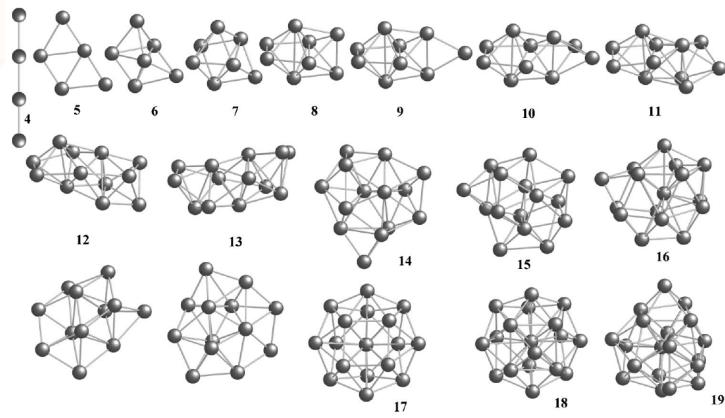

ATOMS &  
MOLECULES

NANOCLUSTERS

**Figure 5.5** A representation of the successive division of a single grain of metal, leading eventually to a size-induced metal-insulator transition. The particle diameter ( $D$ ), nuclearity ( $N$ ) and Kubo gap ( $\delta$ ) are indicated, as are the size regimes spanned by metal clusters.

## Na cluster anions I : optimised structures at T=0 from density functional theory (DFT)

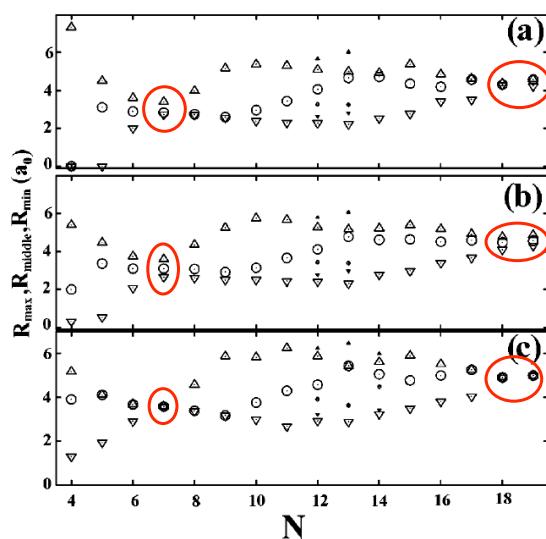

Moseler, Huber, Häkkinen, Landman, Wrigge, Hoffman, von Issendorff, PRB **68**, 165413 (2003)

Hannu Häkkinen, Nanoscience Center, University of Jyväskylä

## Na cluster anions II : Cluster shapes from DFT

Cluster radii from GS (T=0)

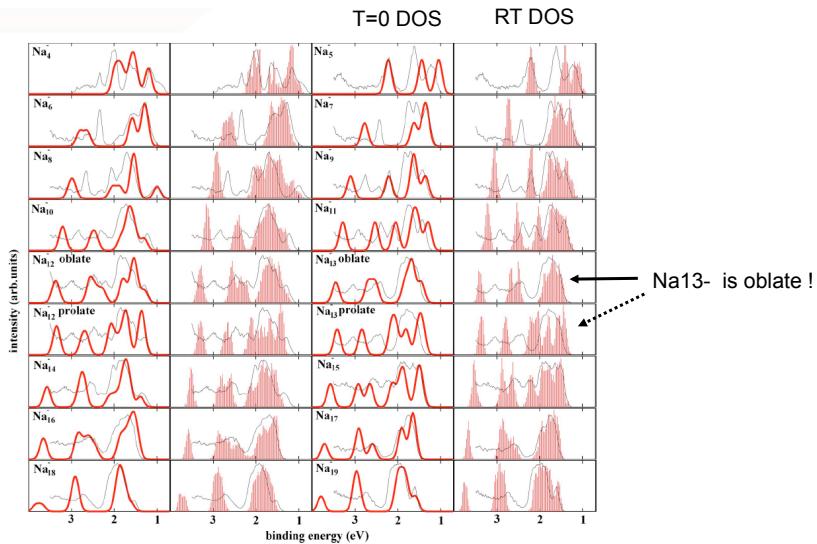

Radius from RT DFT-MD

Radius from jellium model  
Koskinen, Lipas, Manninen  
Z. Phys. D 35, 285 (1995)

Hannu Häkkinen, Nanoscience Center, University of Jyväskylä

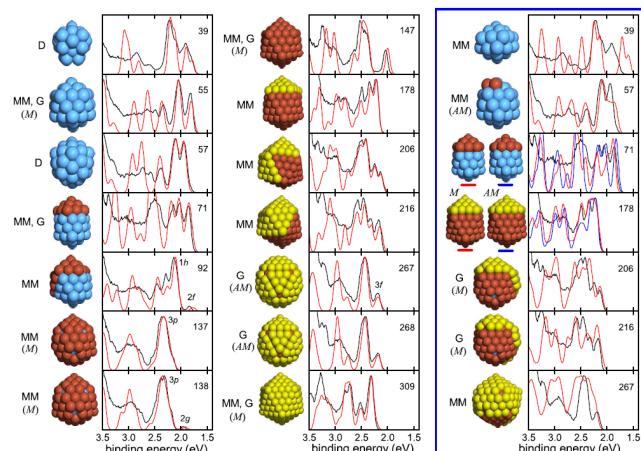

### Na cluster anions III : Photoelectron spectroscopy vs. electron density of states

Hannu Häkkinen, Nanoscience Center, University of Jyväskylä

### Na cluster anions IV : Photoelectron spectroscopy vs. electron density of states

**55 → 147 → 309:**  
Icosahedral growth via overlayers

Kostko, Huber, Moseler,  
Issendorff, PRL **98**,  
043401 (2007)

Hannu Häkkinen, Nanoscience Center, University of Jyväskylä

FIG. 2 (color online). Comparison of photoelectron spectra (black lines) to calculated electron densities of states (colored or shaded lines). The Kohn-Sham levels as obtained by DFT have been broadened by 70 meV width Gaussians and shifted as to reproduce the calculated electron affinity. The structures used in the calculations are indicated (left and center column: assigned ground state structures; right column: wrong structure candidates). The letters give the origin of the structures (MM: ground state structure for Murrell-Mottram potential [26], G: ground state for Gupta potential [26], D: ground state only within DFT) and indicate the structural motif of closed and open shell icosahedral structures (M/AM: Mackay/anti-Mackay overlayer [29]).
