First ICO-ICTP-TWAS Central American Workshop in Lasers, Laser Applications and Laser Safety Regulations

Contents

Laser Resonator's Paraxial Rays Optics

Session One: Tuesday, 1 May 2012, 11h30 – 12h30.

Laser Resonator's Wave Optics.

Session Two: Wednesday, 2 May 2012, 15h00 – 16h00.

Laser Transverse Modes Propagation.

Session Three: Wednesday, 2 May 2012, 16h30 – 17h30.

Holographic or Self-Adaptive Laser Resonators.

Session Four: Thursday, 3 May 2012, 09h00 – 10h00.

Laser Radiation Power Measurement.

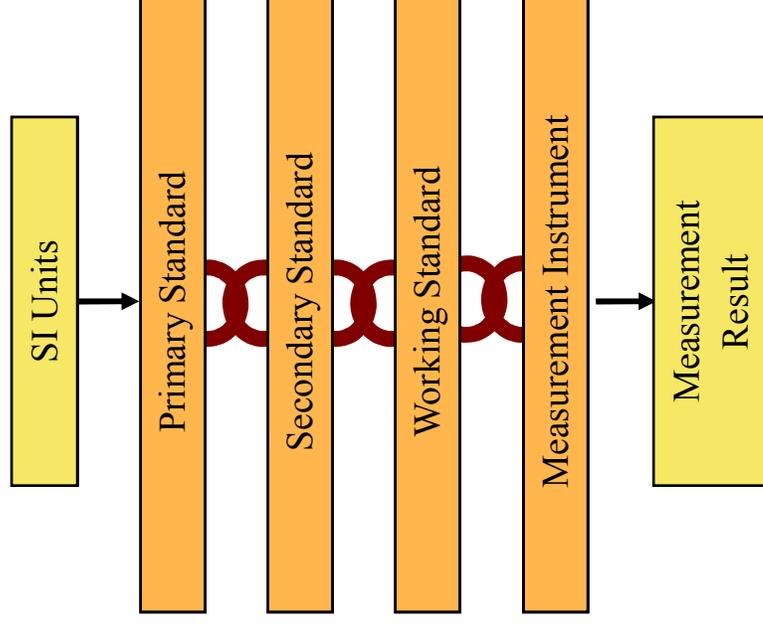

Session Five: Thursday, 3 May 2012, 10h00 – 11h00.

First ICO-ICTP-TWAS Central American Workshop in Lasers, Laser Applications and Laser Safety Regulations

Metrological Traceability.

Property of a measurement result whereby the result can be related to a reference through a documented unbroken chain of calibrations, each contributing to the measurement uncertainty.

VIM, 3 Ed., 2008.

First ICO-ICTP-TWAS Central American Workshop in Lasers, Laser Applications and Laser Safety Regulations

Calibration.

Operation that... establishes a relation between the quantity values with measurement uncertainties provided by measurement standards and corresponding indications with associated measurement uncertainties and... uses this information to establish a relation for obtaining a measurement result from an indication.

VIM, 3 Ed., 2008.

First ICO-ICTP-TWAS Central American Workshop in Lasers, Laser Applications and Laser Safety Regulations

Measurement Uncertainty.

Non-negative parameter characterizing the dispersion of the quantity values being attributed to a measurand, based on the information used.

VIM, 3 Ed., 2008.

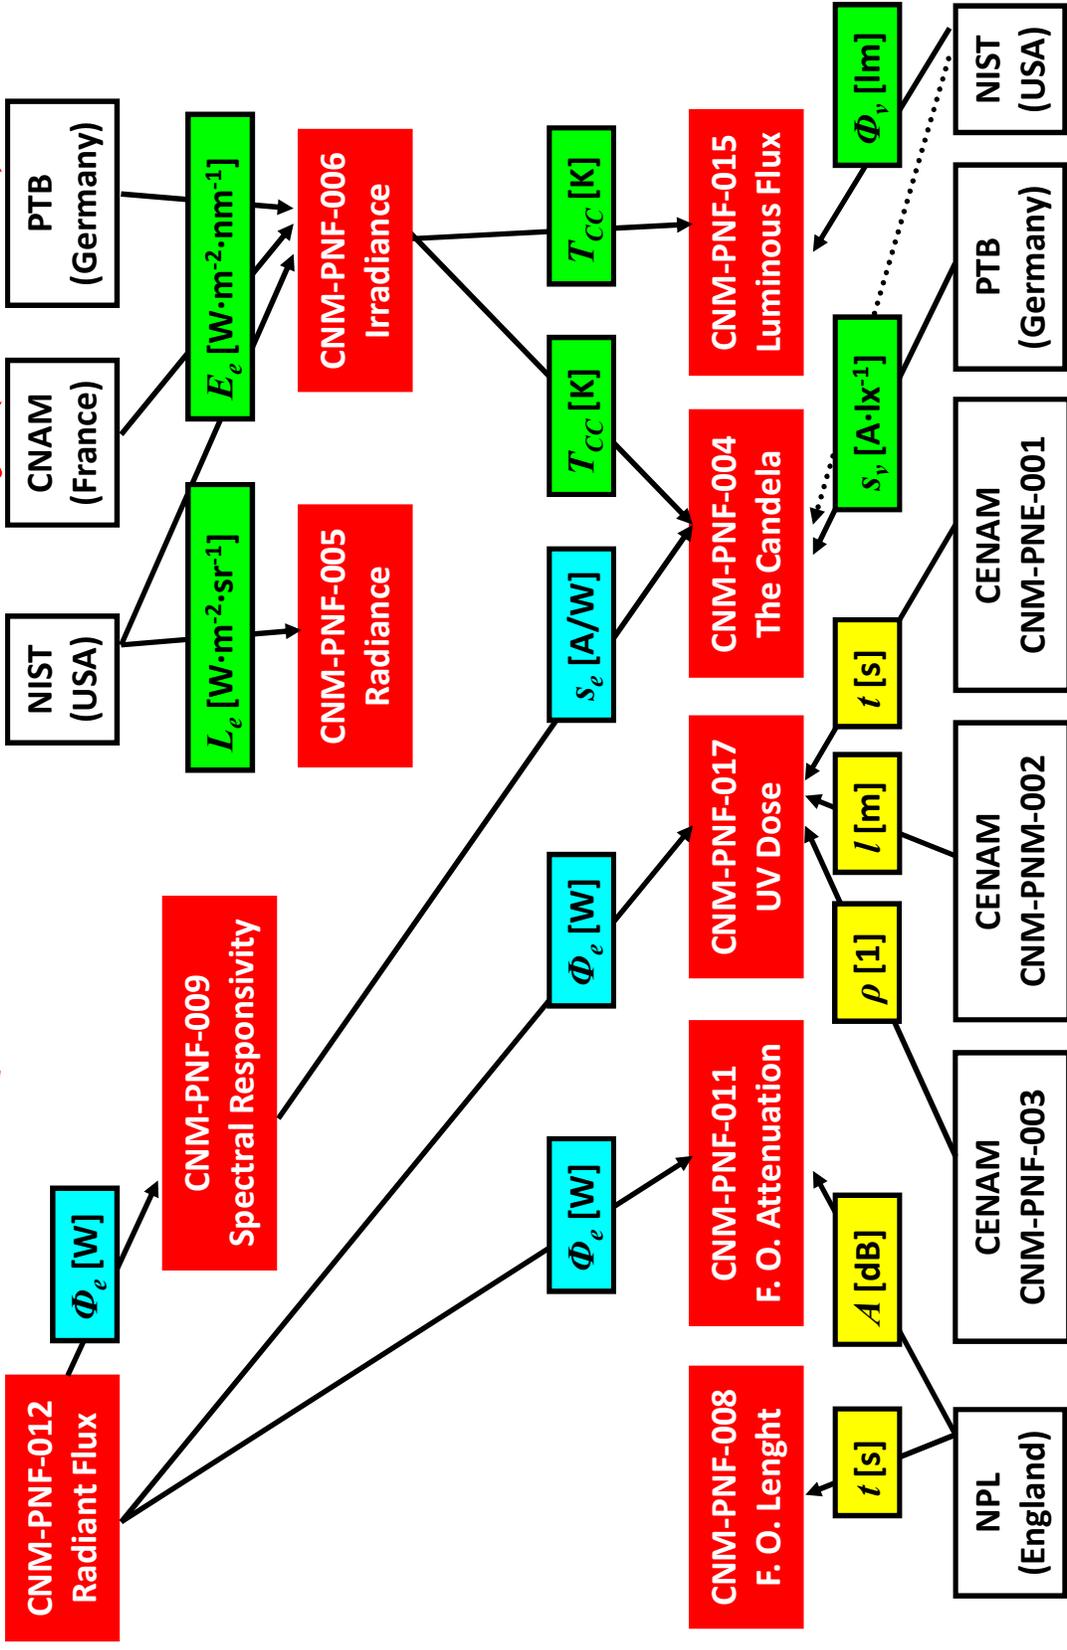

Quantity.

Property of a phenomenon, body, or substance, where the property has a magnitude that can be expressed as a number and a reference.

VIM, 3 Ed., 2008.

First ICO-ICTP-TWAS Central American Workshop in Lasers, Laser Applications and Laser Safety Regulations

Radiometric Quantities Traceability (Mexico).

First ICO-ICTP-TWAS Central American Workshop in Lasers, Laser Applications and Laser Safety Regulations

Radiant Flux or Radiant Power.

Radiant Flux, Radiant Power: (Φ_e , Φ , P)

Power emitted, transmitted or received in the form of radiation.

CIE 17.4, 1987.

Energy Q radiated by a source, per unit time t :

$$\Phi_e = \frac{Q}{t}$$

SI Unit: Watt = Joule per second

Unit symbol: $W = J \cdot s^{-1}$

Laser Resonators: Session Five

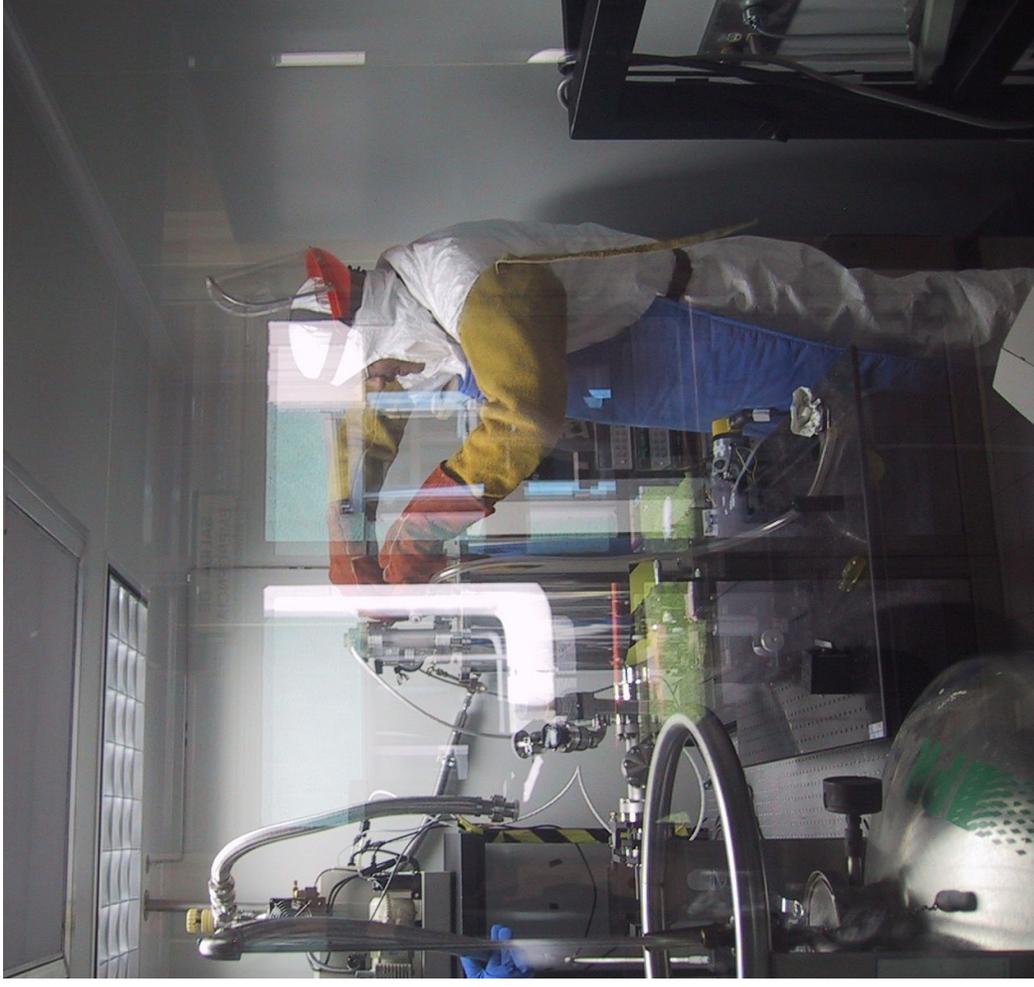

Slide 7

First ICO-ICTP-TWAS Central American Workshop in Lasers, Laser Applications and Laser Safety Regulations

“Optical” Watt Realization.

Realization of a given quantity definition, reported with a certain value and measurement uncertainty.

The “optical” Watt is realized by using an Electrical Substitution Radiometer.

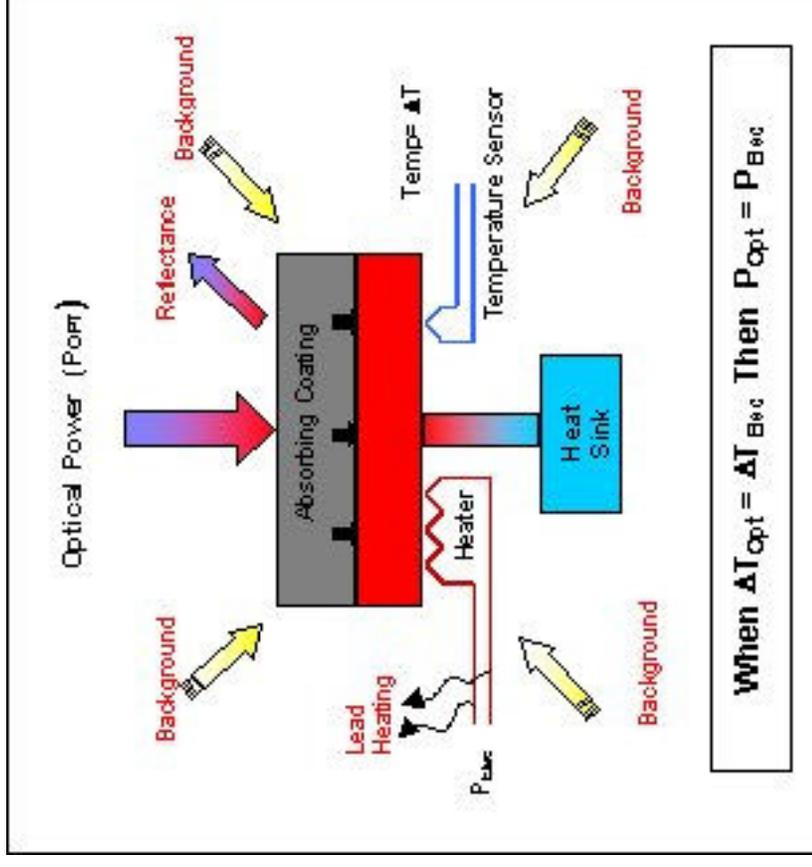

First ICO-ICTP-TWAS Central American Workshop in Lasers, Laser Applications and Laser Safety Regulations

Electrical Substitution Radiometer.

An *ESR* uses a thermometer to measure the temperature increment of a thermal detector, relative to a heat sink constant temperature, between electrical and optical intermittent heating cycles.

The power is adjusted to produce the same thermal detector temperature increment for both warming "types", then the optical and electrical powers can be considered as equivalent.

$$P_{\text{opt}} = \frac{1}{\tau \cdot \alpha} P_{\text{el}}$$

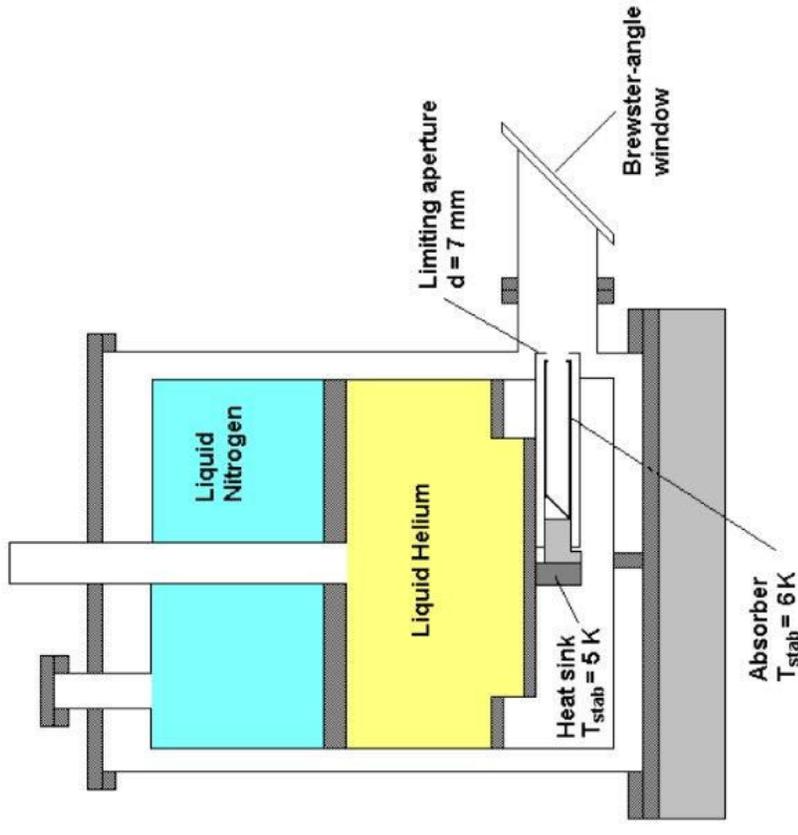

First ICO-ICTP-TWAS Central American Workshop in Lasers, Laser Applications and Laser Safety Regulations

Dark Signal Reduction.

At cryogenic temperatures the heat specific capacity of the absorber reduces about 1 000 times. Such a low heat specific capacity allows the construction of highly absorbent and relatively large cavities, with short response times.

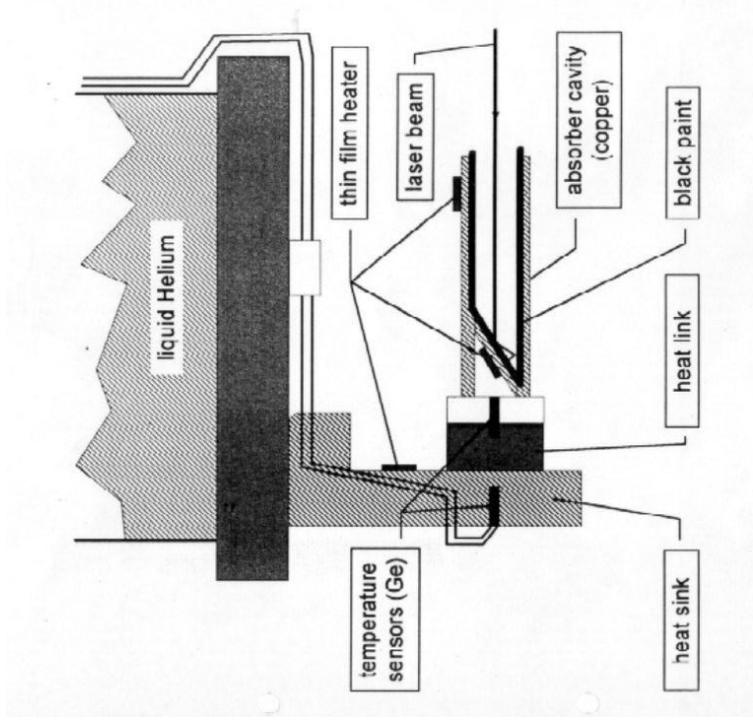

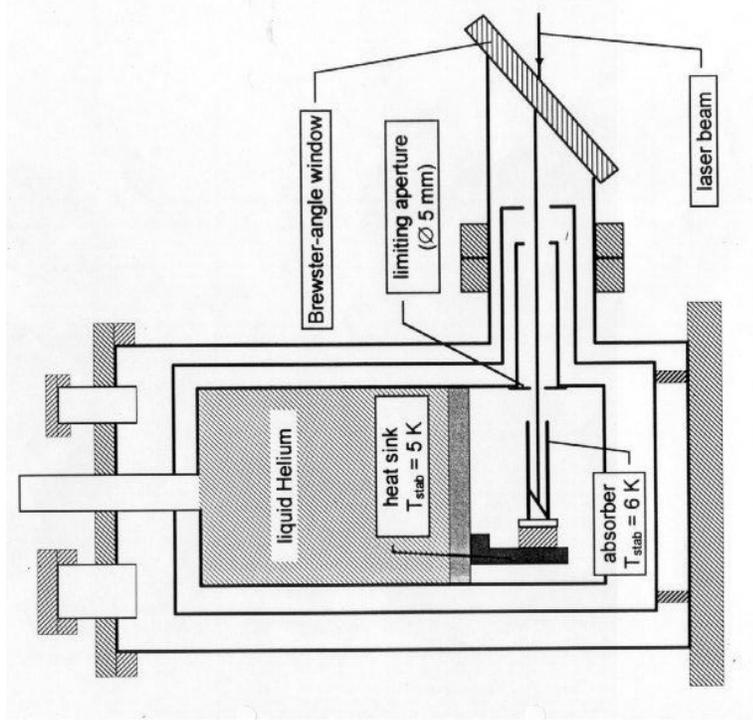

To prevent the dark signal from reaching the radiometric detector, this is operated at cryogenic temperatures, below 20 K; (~ -253 °C), which requires to produce vacuum inside the absorbing ERS cavity.

First ICO-ICTP-TWAS Central American Workshop in Lasers, Laser Applications and Laser Safety Regulations

Cryogenic Radiometry.

At room temperature the dark signal fluctuations, as well as the energy losses in the heater electrical circuit connections, reduce the signal to noise ratio, affecting the readings accuracy.

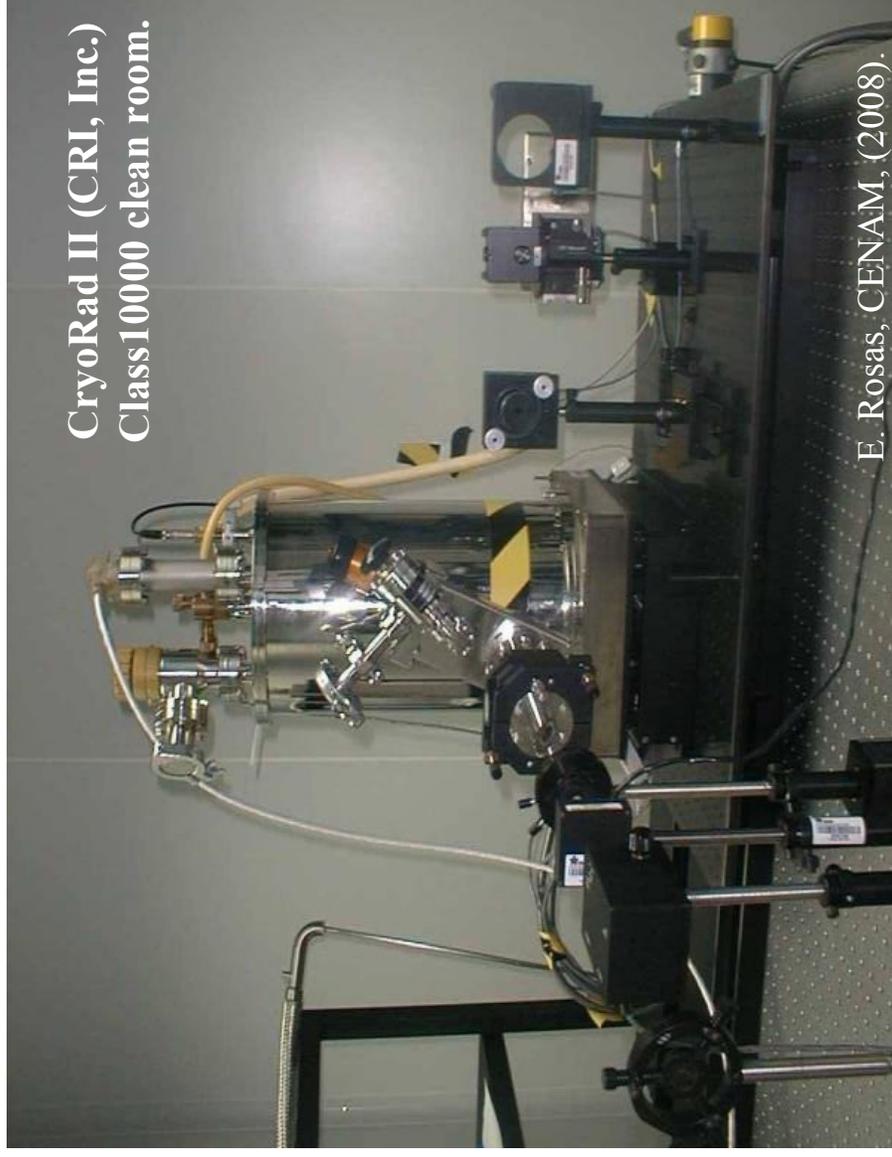

First ICO-ICTP-TWAS Central American Workshop in Lasers, Laser Applications and Laser Safety Regulations

Radiant Flux Mexican Standard

$\pm 0,018 \%$ ($k=2$)

Operating range
10 μW to 0.5 mW
Cavity spectral range
200 nm to 50 μm
Operating wavelength
 $\lambda = 638.2 \text{ nm}$
Cavity absorbance
 $\alpha = 99.9856 \%$
Window transmittance
 $\tau = 99.9522 \%$
Detector responsivity
 $s = 2.6 \text{ K}\cdot\text{mW}^{-1}$
Aperture diameter
 $\phi = 7 \text{ mm}$
Detector response time
 $t = 4 \text{ s}$

First ICO-ICTP-TWAS Central American Workshop in Lasers, Laser Applications and Laser Safety Regulations

Spectral Responsivity.

Spectral Responsivity (of a detector): $(s(\lambda))$

Quotient of the detector output $dY(\lambda)$ by the monochromatic detector input $dX_e(\lambda) = X_{e,\lambda}(\lambda) \cdot d\lambda$ in the wavelength interval $d\lambda$ as a function of the wavelength λ .

CIE 17.4, 1987.

$$s(\lambda) = \frac{dY(\lambda)}{dX_e(\lambda)}$$

SI Unit symbol: $A \cdot W^{-1}$

First ICO-ICTP-TWAS Central American Workshop in Lasers, Laser Applications and Laser Safety Regulations

Spectral Responsivity Mexican Standard

$\pm 0.74 \times 10^{-3} \% (k=2)$

First ICO-ICTP-TWAS Central American Workshop in Lasers, Laser Applications and Laser Safety Regulations

Irradiance.

Irradiance (at a point of a surface): (E_e, E)

Quotient of the radiant flux $d\Phi_e$ incident on an element of the surface containing the point, by the area dA of that element.

CIE 17.4, 1987.

$$E_e = \frac{d\Phi_e}{dA}$$

SI Unit symbol: $\text{W} \cdot \text{m}^{-2}$

First ICO-ICTP-TWAS Central American Workshop in Lasers, Laser Applications and Laser Safety Regulations

Spectral Irradiance Mexican Standard

$\pm 3\%$ ($k=2$)

First ICO-ICTP-TWAS Central American Workshop in Lasers, Laser Applications and Laser Safety Regulations
