## 1 Introduction

- Orbital-dependent functionals

## 2 Exact-exchange (EXX) Kohn-Sham methods

## 3 Direct RPA and EXXRPA correlation energy

- Adiabatic-connection fluctuation-dissipation theorem for KS correlation energy
- EXXRPA methods
- Direct RPA methods
- Selfconsistent direct RPA
- Correlation potentials
- Total energies, reaction energies
- Bond dissociation, static correlation
- Weak interactions, Van-der-Waals bonds

## 4 Concluding Remarks

## 5 Literature

Orbital- and eigenvalue-dependent exchange-correlation functionals in Kohn-Sham methods in order to

- improve accuracy
- get rid of Coulomb self-interactions and self-interactions in general (qualitatively correct KS spectra, improved input data for TDDFT)
- enable description of static correlation (bond formation and breaking)
- enable description of Van der Waals interactions

## Conventional Kohn-Sham methods

$$E_0 = T_s + U[\rho_0] + E_x[\rho_0] + E_c[\rho_0] + \int d\mathbf{r} v_{\text{nuc}}(\mathbf{r}) \rho_0(\mathbf{r})$$

$$\left[ \hat{T} + \hat{v}_{\text{nuc}} + \hat{v}_H[\rho_0] + \hat{v}_x[\rho_0] + \hat{v}_c[\rho_0] \right] \phi_i = \varepsilon_i \phi_i$$

## KS methods with orbital- and eigenvalue-dependent xc-functionals

$$E_0 = T_s[\{\phi_i\}] + U[\rho_0] + E_x[\{\phi_i\}] + E_c[\{\varepsilon_s\}, \{\phi_s\}] + \int d\mathbf{r} v_{\text{nuc}}(\mathbf{r}) \rho(\mathbf{r})$$

$$\left[ \hat{T} + \hat{v}_{\text{nuc}} + \hat{v}_H[\rho_0] + \hat{v}_x[\{\phi_i\}] + \hat{v}_c[\{\varepsilon_s\}, \{\phi_s\}] \right] \phi_i = \varepsilon_i \phi_i$$

## Exchange energy

$$E_x = -\frac{1}{2} \sum_{i,j}^{\text{occ.}} \int d\mathbf{r} d\mathbf{r}' \frac{\phi_i(\mathbf{r}')\phi_j(\mathbf{r}')\phi_j(\mathbf{r})\phi_i(\mathbf{r})}{|\mathbf{r}' - \mathbf{r}|}$$

Exchange potential  $v_x(\vec{r}) = \frac{\delta E_x[\{\phi_i\}]}{\delta \rho(\vec{r})}$

$$\int d\mathbf{r}' \chi_0(\mathbf{r}, \mathbf{r}') v_x(\mathbf{r}') = t_x(\mathbf{r})$$

KS response function  $\chi_0(\mathbf{r}, \mathbf{r}') = 4 \sum_i^{\text{occ.}} \sum_a^{\text{unocc.}} \frac{\phi_i(\mathbf{r})\phi_a(\mathbf{r})\phi_a(\mathbf{r}')\phi_i(\mathbf{r}')}{\varepsilon_i - \varepsilon_a}$

$$t_x(\mathbf{r}) = 4 \sum_i^{\text{occ.}} \sum_a^{\text{unocc.}} \frac{\phi_i(\mathbf{r})\phi_a(\mathbf{r}) \langle a | \hat{v}_x^{\text{NL}} | i \rangle}{\epsilon_i - \epsilon_a}$$

Plane wave methods for solid numerically stable  
 Gaussian basis set methods for molecules numerically demanding

Auxiliary basis set: Electrostatic potential of Gaussian functions

$$v_x(\mathbf{r}) = \sum_k v_{x,k} f_k(\mathbf{r}) \quad \text{with} \quad f_k(\mathbf{r}) = \int d\mathbf{r}' g_k(\mathbf{r}') / |\mathbf{r} - \mathbf{r}'|$$

Incorporation of exact conditions to treat asymptotic of  $v_x(\mathbf{r})$

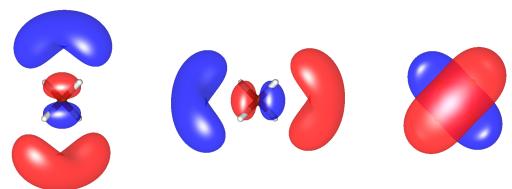

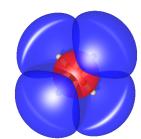

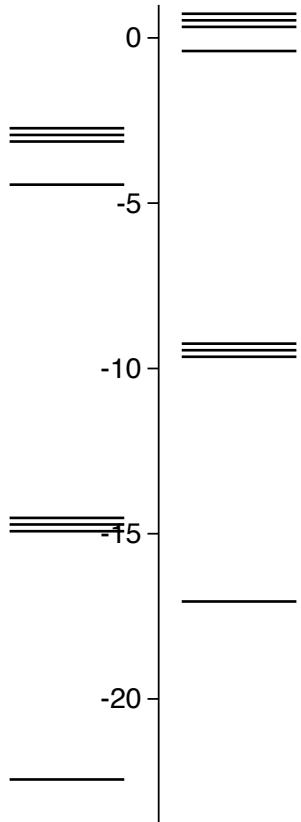

$$\int dr \rho_x(\mathbf{r}) = -1 \quad \text{with} \quad \rho_x(\mathbf{r}) = \sum_k v_{x,k} g_k(\mathbf{r})$$

$$\langle \phi_{HOMO} | v_x | \phi_{HOMO} \rangle = \langle \phi_{HOMO} | \hat{v}_x^{\text{NL}} | \phi_{HOMO} \rangle$$

- Complete exchange kernel can be treated (RI-EXXRPA+)
- $N^5$  scaling

## RI2-dRPA

$$E_c = \frac{-1}{2\pi} \int_0^\infty d\omega \int_0^1 d\alpha \operatorname{Tr} \left[ \mathbf{S}^{-1} \mathbf{X}_0 [\mathbf{X}_0 - \alpha \mathbf{H}_H]^{-1} \mathbf{X}_0 - \mathbf{S}^{-1} \mathbf{X}_0 \right]$$

For dRPA, with second RI approximation and  $\mathbf{S} = \mathbf{E}$ ,  $\mathbf{H}_H$  simplifies to

$$\mathbf{H}_H = \mathbf{X}_0 \mathbf{X}_0$$

With spectral representation  $\mathbf{X}_0(i\omega) = -\mathbf{V}(i\omega) \boldsymbol{\sigma}(i\omega) \mathbf{V}^\top(i\omega)$

$$E_c = \frac{1}{2\pi} \int_0^\infty d\omega \operatorname{Tr} [\ln[\mathbf{1} + \boldsymbol{\sigma}(i\omega)] - \boldsymbol{\sigma}(i\omega)]$$

- Only KS response function  $\mathbf{X}_0(i\omega)$  required
- $N^4$  scaling

Optimized-effective-potential equation for  $v_c^{\text{dRPA}}$

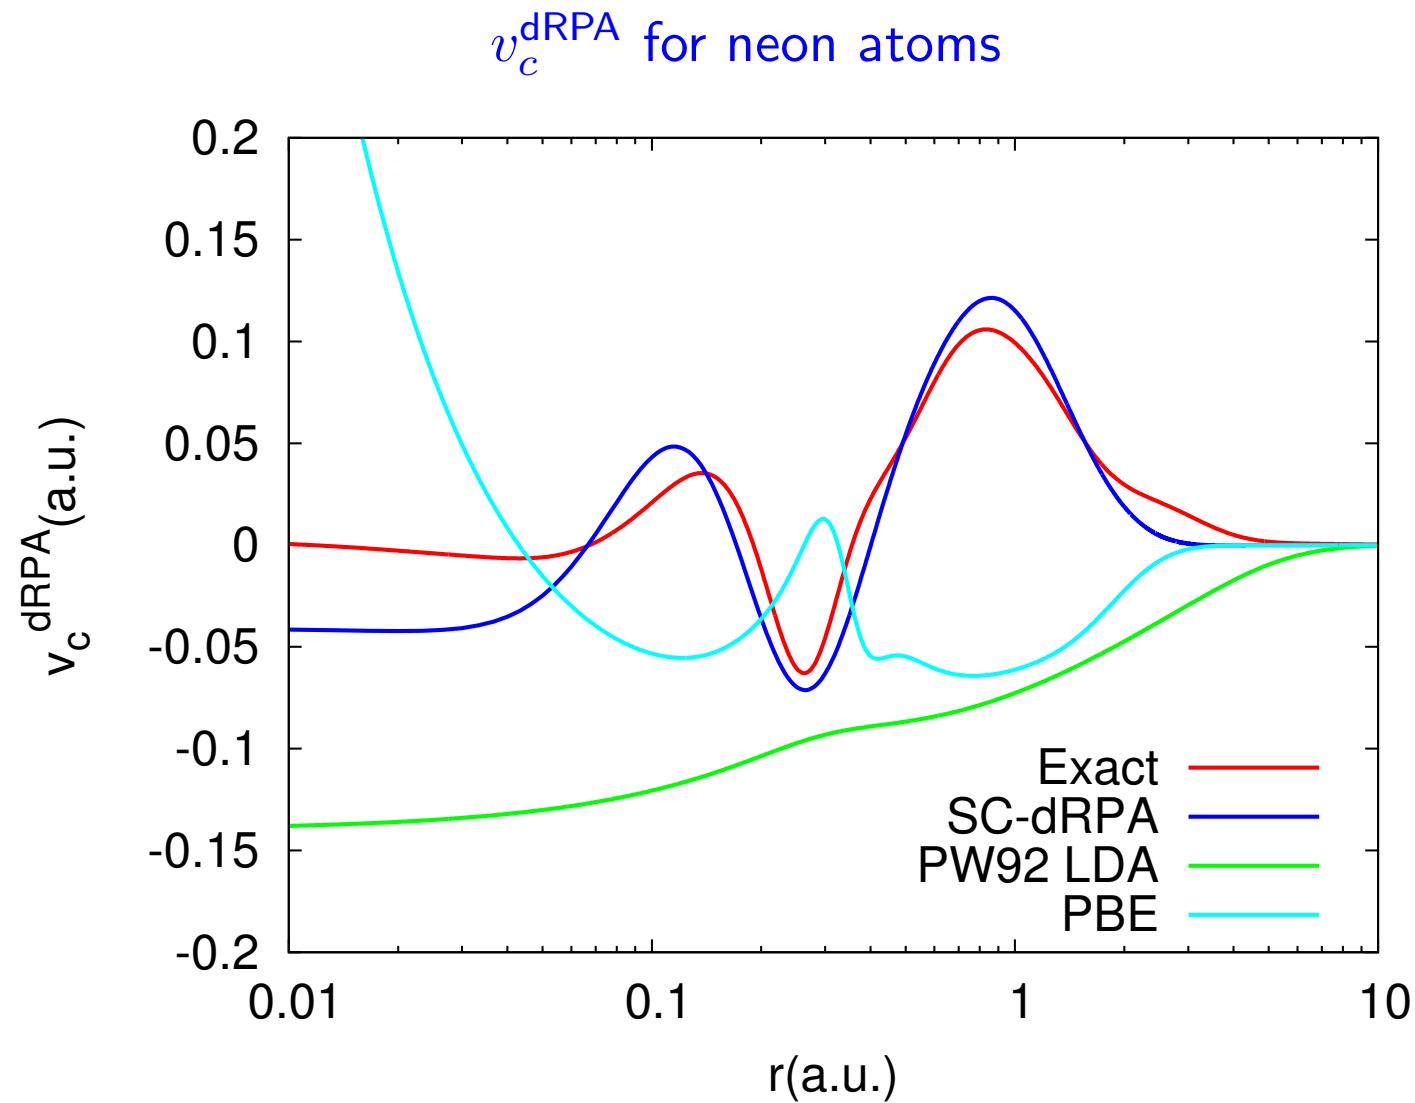

$$\int d\mathbf{r}' \chi_0(\mathbf{r}, \mathbf{r}') v_c^{\text{dRPA}}(\mathbf{r}') = t_c^{\text{dRPA}}(\mathbf{r})$$

with  $t_c^{\text{dRPA}}(\mathbf{r}) = \sum_s \int d\mathbf{r}' \frac{\delta E_c^{\text{dRPA}}}{\delta \phi_s(\mathbf{r}')} \frac{\delta \phi_s(\mathbf{r}')}{\delta v_s(\mathbf{r})} + \sum_s \frac{\delta E_c^{\text{dRPA}}}{\delta \epsilon_s} \frac{\delta \epsilon_s}{\delta v_s(\mathbf{r})}$

$v_c^{\text{dRPA}}$  is represented in auxiliary basis set

$$\mathbf{X}_0 v_c^{\text{dRPA}} = \mathbf{t}_c^{\text{dRPA}}$$

- EXXRPA correlation functional combines accuracy at equilibrium geometries with a correct description of dissociation (static correlation) and a highly accurate treatment of VdW interactions
- EXXRPA correlation functional is self-interaction free
- Self-consistent dRPA yields qualitatively reasonable correlation potentials in contrast to conventional KS methods
- Promising starting point for further developments, e.g., completely self-consistent EXXRPA method or inclusion of correlation in kernel
