

Luminous matter shedding light on dark matter

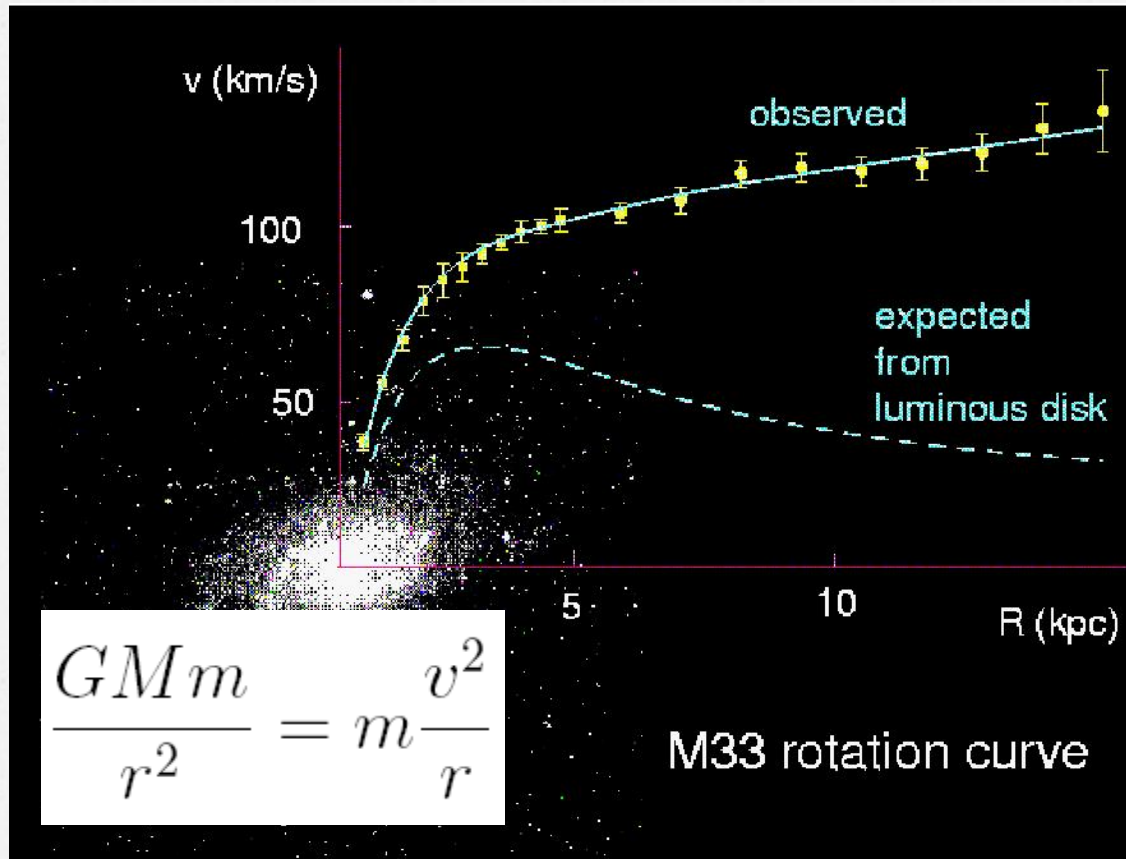

Yasaman Farzan
IPM, Tehran

Evidence for Dark Matter

- Rotation curve
- Galaxy clusters
- Bullet clusters
- Structure Formation
- Cosmic Microwave background

Rotation curve

Dark Matter abundance

Impact on structure formation

- o Cold Dark Matter: $M > 100$ keV

$$m_{DM} > \frac{m_e}{5}$$

- o Warm Dark matter: $M = \text{few keV to few } 10 \text{ keV}$

$$m_{DM} \sim \frac{m_e}{100}$$

- ~~o Hot Dark matter: $M < \text{keV}$~~

~~$$m_{DM} < \frac{m_e}{1000}$$~~

Requisites of Dark Matter candidate

- o Neutral (no long range interactions other than gravity)
- o Stable or metastable with lifetime much larger than the age of Universe
- o Observed abundance

Can Relic neutrinos play the role of DM?

No

$$m_{\nu_e} < 2.2 \text{ eV}$$

Hot Dark Matter

$$\Omega_\nu \approx \frac{m_\nu}{91.5 h^2 \text{ eV}} \cdot$$

$$h \equiv H_0 / (100 \text{ km/sec Mpc})$$

$$(\Omega_\nu / \Omega_m \lesssim 0.2)$$

WIMP

Scalar particle or a fermion

With mass $\sim 100 \text{ GeV} - 1000 \text{ GeV}$

Interaction of order of electroweak interaction

Weakly Interacting Massive Particle

WIMP miracle

o This is a simple minimalistic model.

o This is a simple minimalistic model.

o Has mother nature promised us to be always simple?

Nature in its common sense

u, d, gluon, photon and electron

Nucleon

Our beautiful but no so austere world

It would be a pity if

Gauge group of SM

$$SU(3) \times SU(2) \times U(1)$$

Electroweak gauge group

Gauge group of SM

$$SU(3) \times SU(2) \times U(1)$$

Electroweak gauge group

Charged current: W boson \longleftrightarrow beta-decay

Gauge group of SM

$$SU(3) \times SU(2) \times U(1)$$

Electroweak gauge group

Neutral current: Z boson

Ideas to make DM less boring

- o Multiple Dark Matter Candidates
- o Dark atoms (Mirror models)
- o Vector Dark Matter
- o Light Dark Matter
- o

Ideas to make DM less boring

Two great mysteries

- Smallness of neutrino mass

- Nature of Dark Matter

o Old SM: Neutrinos are massless.

o Observation: Neutrinos have a tiny mass

Smallness of neutrino mass

◦ Neutrino mass/Electron mass $< 1/1000000$

Smallness of neutrino mass

o Neutrino mass/Electron mass $< 1/1000000$

Mechanisms to explain smallness of neutrino mass

- o Seesaw mechanism(s)

- o Loop suppression

Linking two mysteries

Are small neutrino masses unveiling the missing mass problem of the Universe?

C. Boehm, **Y. F.**, T. Hambye, S. Palomares-Ruiz and S. Pascoli, *Phys Rev D* 77 (2008) 043516

Low energy sector

Effective Lagrangian:

$$\mathcal{L}_I \supset g \phi \bar{N} \nu_L$$

$$Z_2 : \quad \phi \rightarrow -\phi, \quad N \rightarrow -N \quad \text{but} \quad \text{SM} \rightarrow \text{SM}$$

ϕ is a neutral scalar

SLIM=Scalar as Light as MeV

Neutrino mass

$$m_{\nu_L} = \frac{g^2}{16 \pi^2} m_N \left[\ln \left(\frac{\Lambda^2}{m_N^2} \right) - \frac{m_\phi^2}{m_N^2 - m_\phi^2} \ln \left(\frac{m_N^2}{m_\phi^2} \right) \right]$$

Freeze-out scenario for production

$$\langle \sigma(\phi\phi \rightarrow \nu_L \nu_L) \nu_r \rangle = \langle \sigma(\phi\phi \rightarrow \bar{\nu}_L \bar{\nu}_L) \nu_r \rangle \simeq \frac{g^4}{4\pi} \frac{m_N^2}{(m_\phi^2 + m_N^2)^2},$$

Observed abundance:

$$\langle \sigma \nu_r \rangle \simeq 10^{-26} \text{ cm}^3/\text{s}.$$

Bounds on parameters

Neutrino masses+Observed DM abundance

$$o(1) \text{ MeV} \lesssim m_N \lesssim 10 \text{ MeV.}$$

$$m_N \sim m_e$$

$$3 \times 10^{-4} \lesssim g \lesssim 10^{-3}$$

Potential signature

Missing energy in **Pion** and **Kaon** decay

Lessa and Peres PRD (07) 94001, Britton et al., PRD 49 (94) 28; Barger et al., PRD 25 (82) 907; Gelmini et al., NPB209 (82) 157

Realization of the scenario

$m_N < 10 \text{ MeV}$ \Rightarrow N has to be **singlet**.

Therefore, $\mathcal{L}_I \supset g\phi\bar{N}\nu$ must be effective and can obtain this form only after electroweak symmetry breaking.

An economic model embedding *real* SLIM

YF, “Minimal model linking two great mysteries:
Neutrino mass and dark matter”, PRD

Field content

An electroweak singlet scalar η ;

Two (or more) Majorana right-handed neutrinos N_i

A scalar electroweak doublet, $\Phi^T = [\phi^0 \ \phi^-]$

$$\phi^0 \equiv (\phi_1 + i\phi_2)/\sqrt{2}$$

We impose a Z_2 symmetry under which all the new particles are odd.

Light and heavy

Light sector: Dark matter candidate δ_1 and N_1
(similar to what we had in the SLIM scenario)

Heavy sector: ϕ_2 ϕ^- ϕ^+ δ_2

Lepton Flavor Violating rare decays, $\mu \rightarrow e\gamma$, $\tau \rightarrow \mu\gamma$ and $\tau \rightarrow e\gamma$

Magnetic dipole moment of the muon

Production at LHC

Interesting aspect

LHC

$g_{i\alpha}$

$\text{Br}(\mu \rightarrow e\gamma)$

Neutrino mass

Kaon decay

Conclusion

Dark sector might be as rich and as dazzling as SM sector.

Low energy but high luminosity experiments (like experiments searching for rare meson decays) might be the places to look for DM.

Bullet cluster

PLANCK data on CMB

Relative height

$$\Omega_m h^2 = 0.1423 \pm 0.0029 \quad (68\%; \text{Planck}).$$

Position of the peak

$$\Omega_b h^2 = 0.02207 \pm 0.00033 \quad (68\%; \text{Planck}).$$
