

# S2S Forecasts: Applications considerations

Andrew W Robertson  
[awr@iri.columbia.edu](mailto:awr@iri.columbia.edu)

International Research Institute  
for Climate and Society  
EARTH INSTITUTE | COLUMBIA UNIVERSITY

*Advanced School and Workshop on Subseasonal to Seasonal (S2S) Prediction and Application to Drought Prediction,  
ICTP, Trieste, Nov 23 – Dec 4, 2015*

# Outline

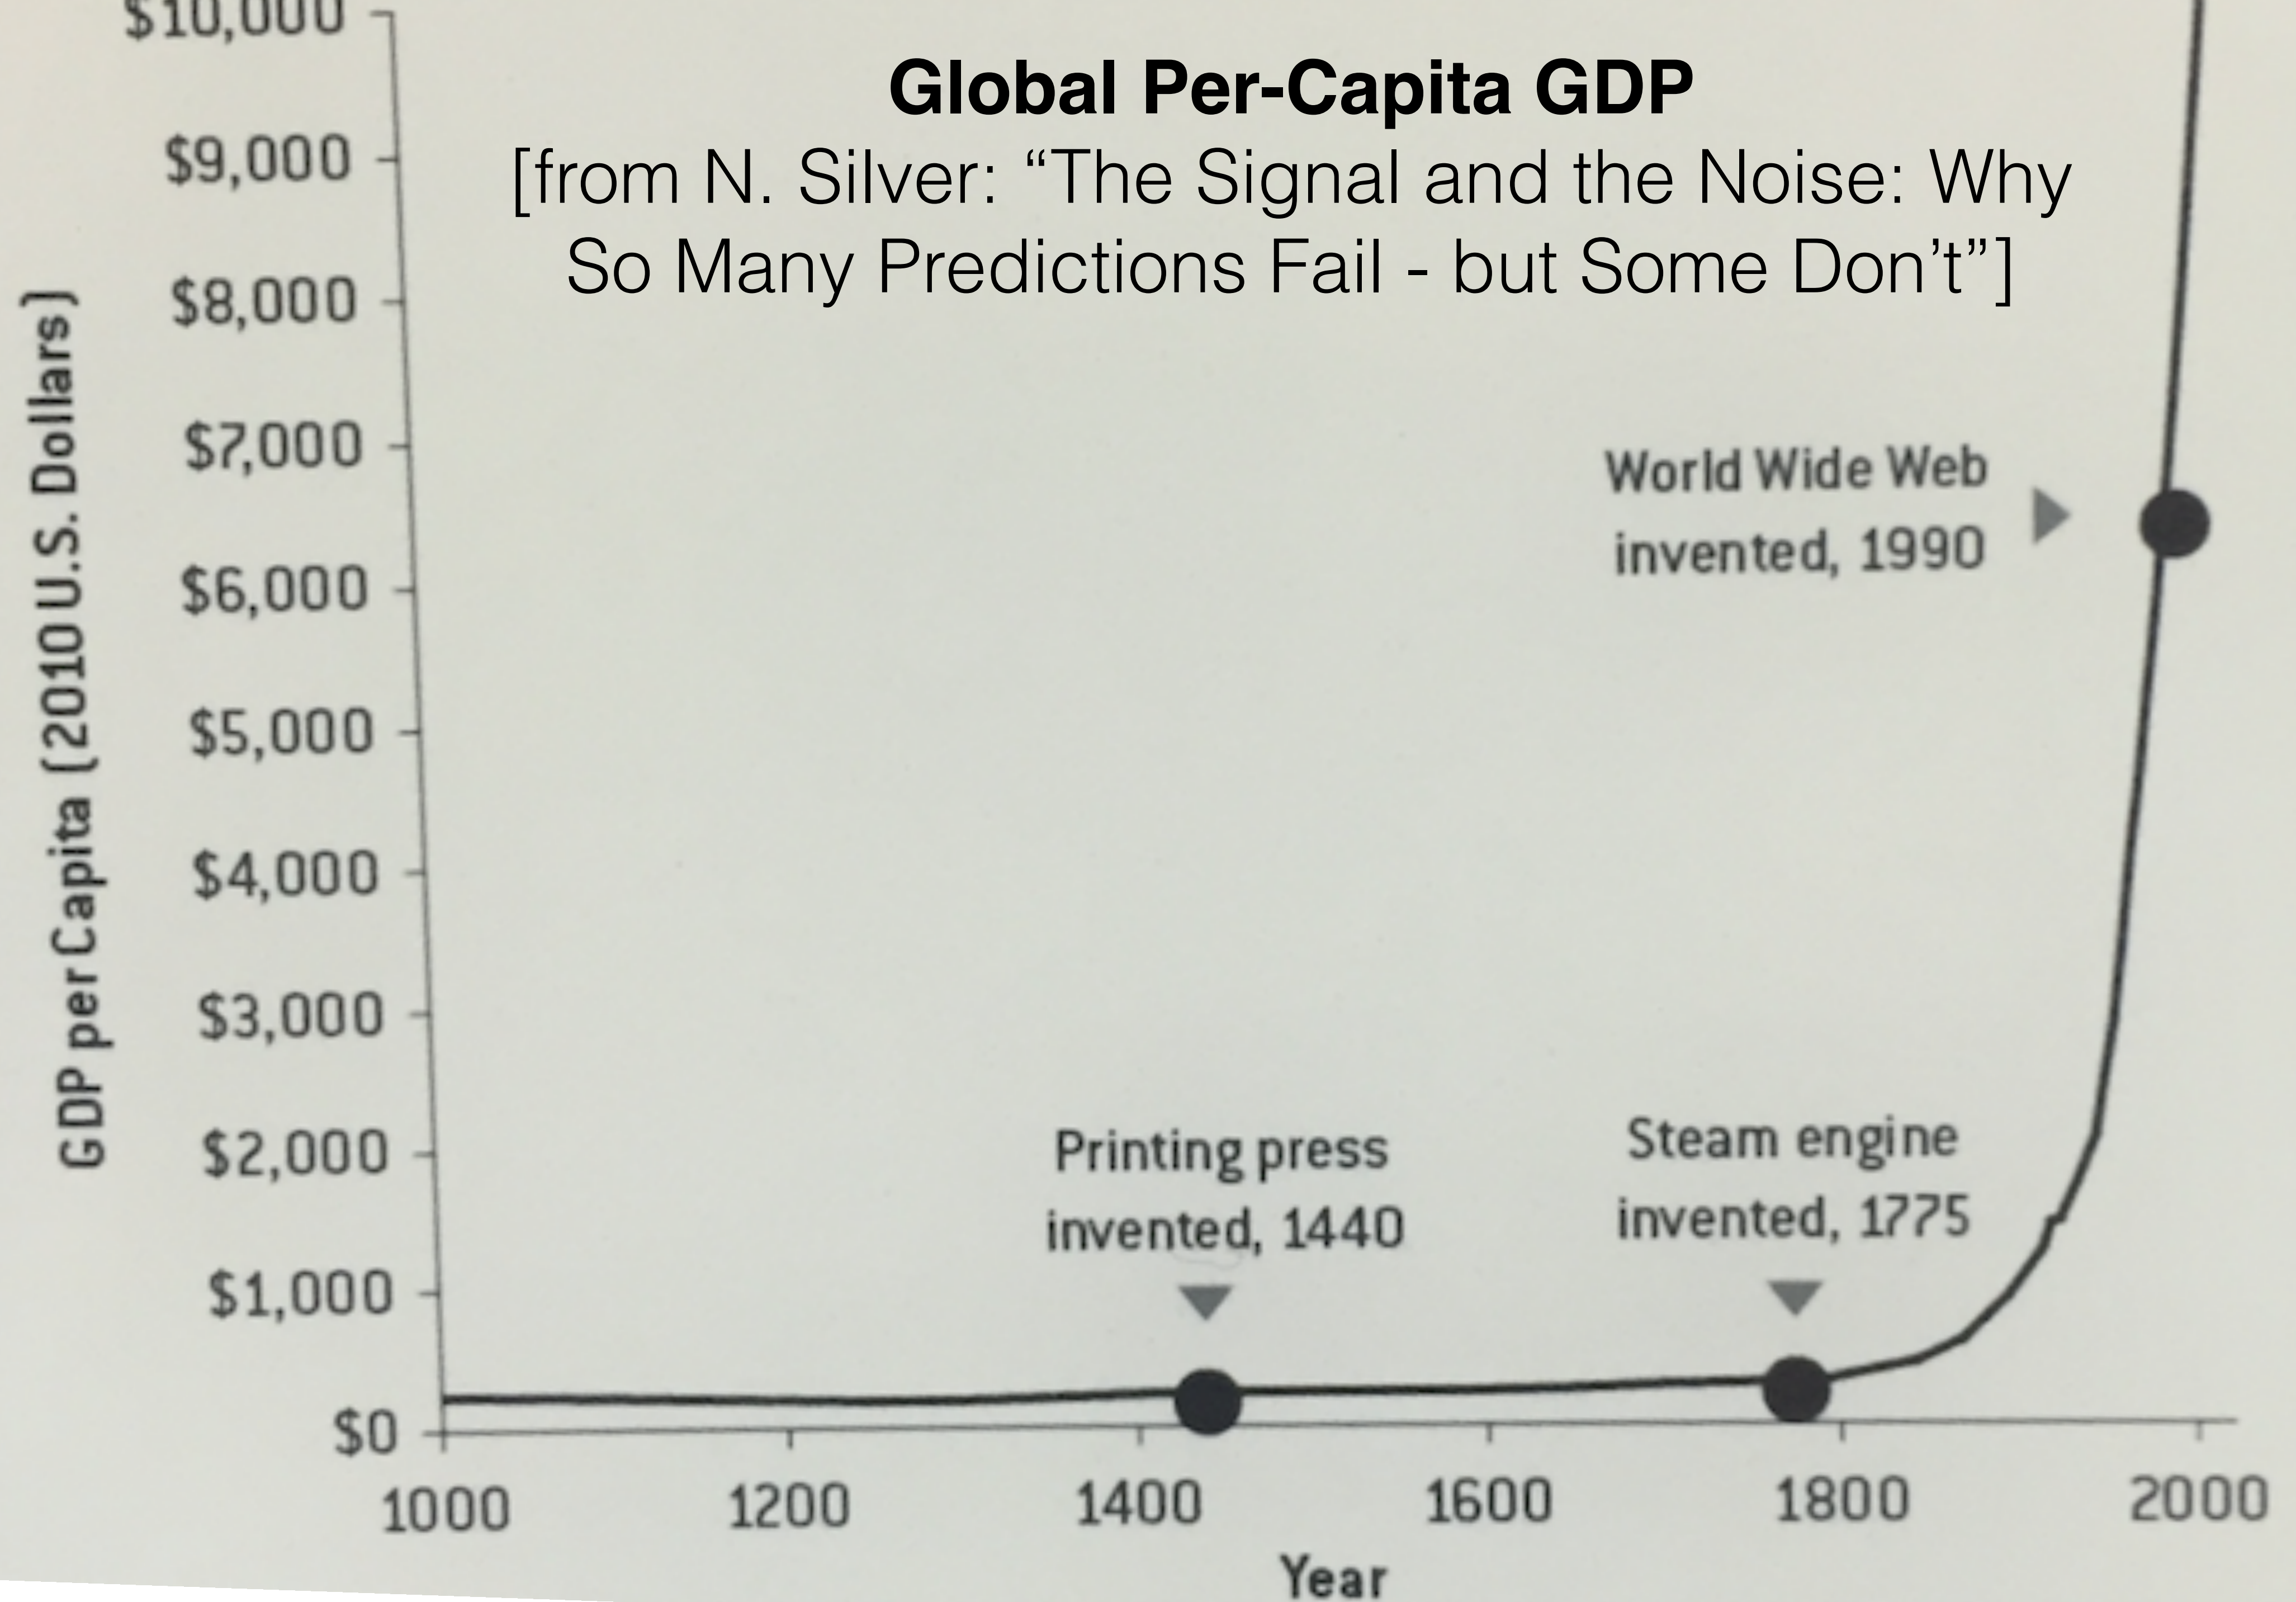

1. Types of forecast user and application
2. What makes forecast information valuable to a user?
  - Salience, Timeliness, Credibility, Understandability, Legitimacy

*Can we translate scientific information into useful knowledge?*

## Global Per-Capita GDP

[from N. Silver: "The Signal and the Noise: Why So Many Predictions Fail - but Some Don't"]

# Types of forecast user and application

- Hazard early warning - enhancing preparedness to high-impact weather events
- Management decisions in weather-sensitive operations
- Large range of users, from sophisticated to general

**GFCS provides a worldwide mechanism for coordinated actions to enhance the quality, quantity and application of climate services.**

[Previous](#) [Resume](#) [Next](#)

## Priority areas

**Agriculture and food security**

**Disaster risk reduction**

**Health**

**Water**

## GFCS in action

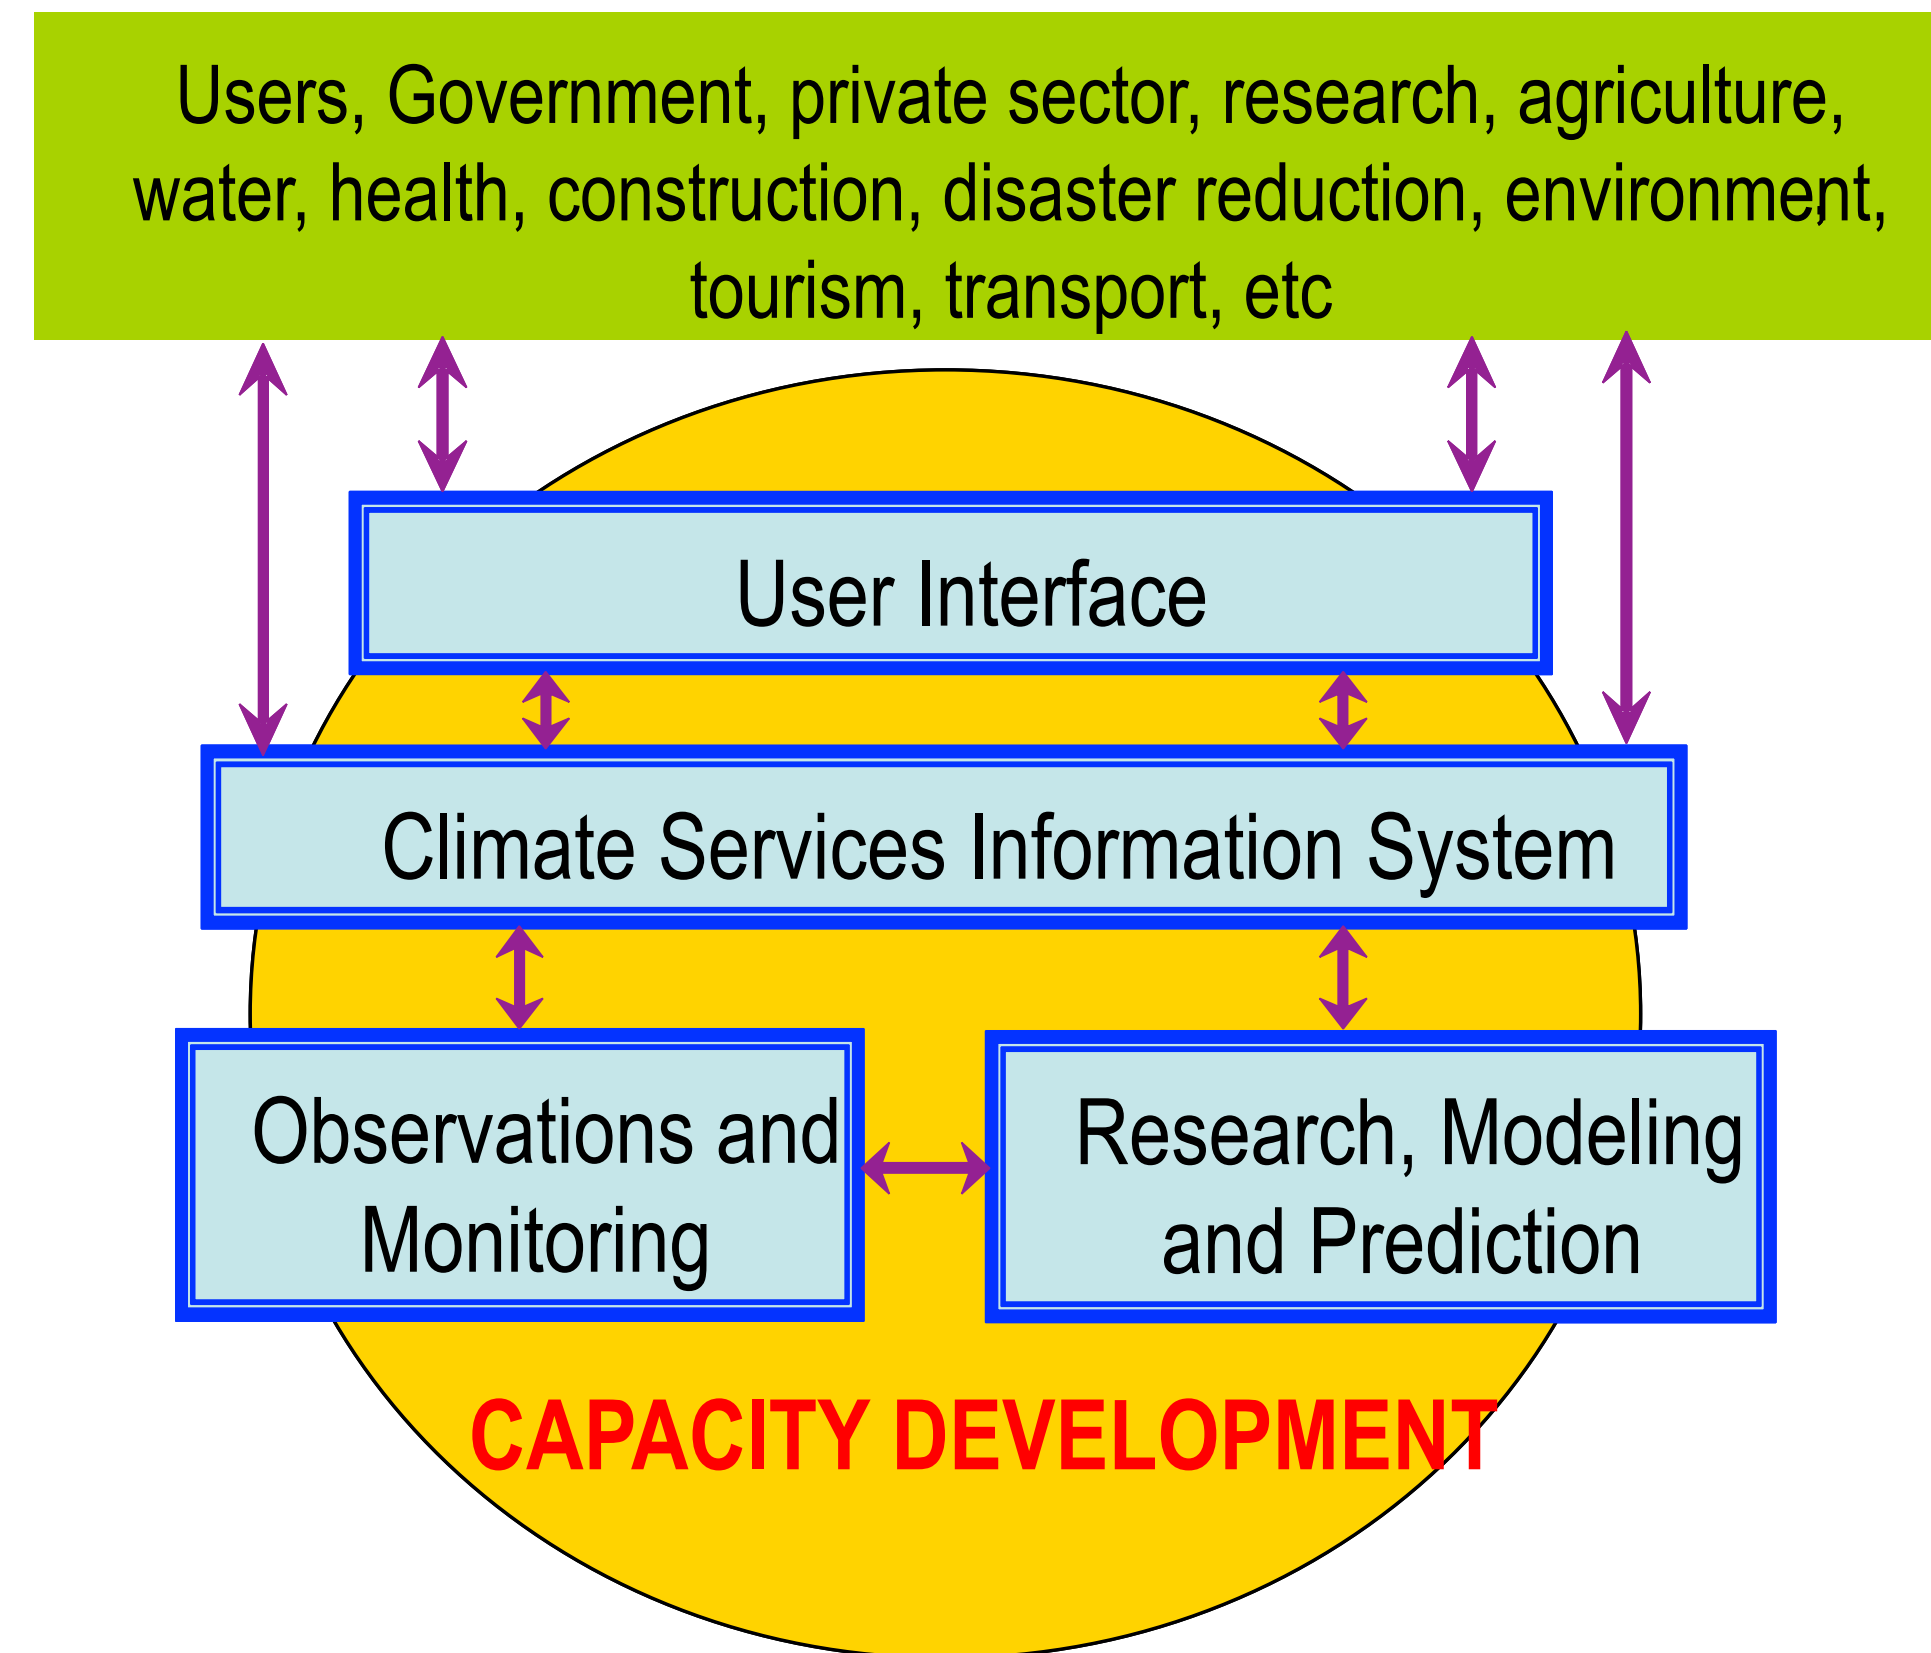

## Latest Contributions

**The International Climate Assessment and Dataset (ICA&D)**  
Submitted on: March 11, 2015

# Pillars of GFCS

- **User Interface Platform** - to provide a means for users, user representatives, climate researchers and climate service providers to interact
- **Climate Services Information System** - to collect, process and distribute climate data and information according to the needs of users and according to the procedures agreed by governments and other data providers
- **Observations and Monitoring** - to ensure that the climate observations necessary to meet the needs of climate services are generated.
- **Research, Modelling and Prediction** - to assess and promote the needs of climate services within research agendas
- **Capacity Development** - to support systematic development of the necessary institutions, infrastructure and human resources to provide effective climate services.

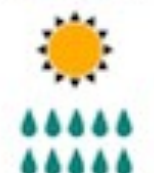

# How farmers around the world are making decisions based on weather and climate information

*As climate change threatens food production, climate information services are helping farmers in Africa and South Asia make better decisions in the short and long-term to adapt to changing growing conditions.*

	Type of information	Vehicles for delivering information	Farmer decisions affected
<b>WEATHER</b> Days to weeks	 <ul style="list-style-type: none"> <li>Observed rainfall and temperature</li> <li>Daily forecasts up to one week ahead of time</li> <li>Alerts on pests and diseases</li> <li>Early warning of extreme weather events</li> </ul>	 <ul style="list-style-type: none"> <li>Mobile phones</li> <li>Radio</li> <li>Television</li> </ul>	 <ul style="list-style-type: none"> <li>Timing of planting and harvest</li> <li>Timing of fertilizer, pesticide, and irrigation application</li> <li>Protecting lives and property from extreme events</li> </ul>
<b>CLIMATE VARIABILITY</b> Months to Years	 <ul style="list-style-type: none"> <li>Probabilities for seasonal rainfall and temperature conditions</li> <li>Seasonal climate variables targeted to particular agricultural risks (dry spells, rainy season start date, etc)</li> <li>Historical variability of climate variables</li> </ul>	 <ul style="list-style-type: none"> <li>Workshops with experts</li> <li>Conversations with agricultural extension agents (farm educators)</li> </ul>	 <ul style="list-style-type: none"> <li>Selecting crops and varieties</li> <li>Livestock stocking rates and feeding strategies</li> <li>Intensity of input use (fertilizer, pesticides)</li> <li>Labor or marketing contracts</li> <li>Intensifying and diversifying crops</li> <li>Diversifying sources of income</li> </ul>

<b>WEATHER</b>  Days to weeks	 <ul style="list-style-type: none"> <li>• Observed rainfall and temperature</li> <li>• Daily forecasts up to one week ahead of time</li> <li>• Alerts on pests and diseases</li> <li>• Early warning of extreme weather events</li> </ul>	 <ul style="list-style-type: none"> <li>• Mobile phones</li> <li>• Radio</li> <li>• Television</li> </ul>	 <ul style="list-style-type: none"> <li>• Timing of planting and harvest</li> <li>• Timing of fertilizer, pesticide, and irrigation application</li> <li>• Protecting lives and property from extreme events</li> </ul>
<b>CLIMATE VARIABILITY</b>  Months to Years	 <ul style="list-style-type: none"> <li>• Probabilities for seasonal rainfall and temperature conditions</li> <li>• Seasonal climate variables targeted to particular agricultural risks (dry spells, rainy season start date, etc)</li> <li>• Historical variability of climate variables</li> </ul>	 <ul style="list-style-type: none"> <li>• Workshops with experts</li> <li>• Conversations with agricultural extension agents (farm educators)</li> </ul>	 <ul style="list-style-type: none"> <li>• Selecting crops and varieties</li> <li>• Livestock stocking rates and feeding strategies</li> <li>• Intensity of input use (fertilizer, pesticides)</li> <li>• Labor or marketing contracts</li> <li>• Intensifying and diversifying crops</li> <li>• Diversifying sources of income</li> </ul>

# Challenges to achieving seasonal forecast value

Forecast needs to be:

- Salient: meet user's needs
- Credible
- Understandable
- Legitimate: Come from a trusted source

(often these concepts overlap)

# Some Aspects of Salience

- Should be specific and timely – opportunities for S2S
- Should address decision-relevant variables, e.g. characteristics of local daily rainfall, monsoon onset date, river flow, drought
  - tailoring of forecast information

# Agricultural relevance of *daily* rainfall

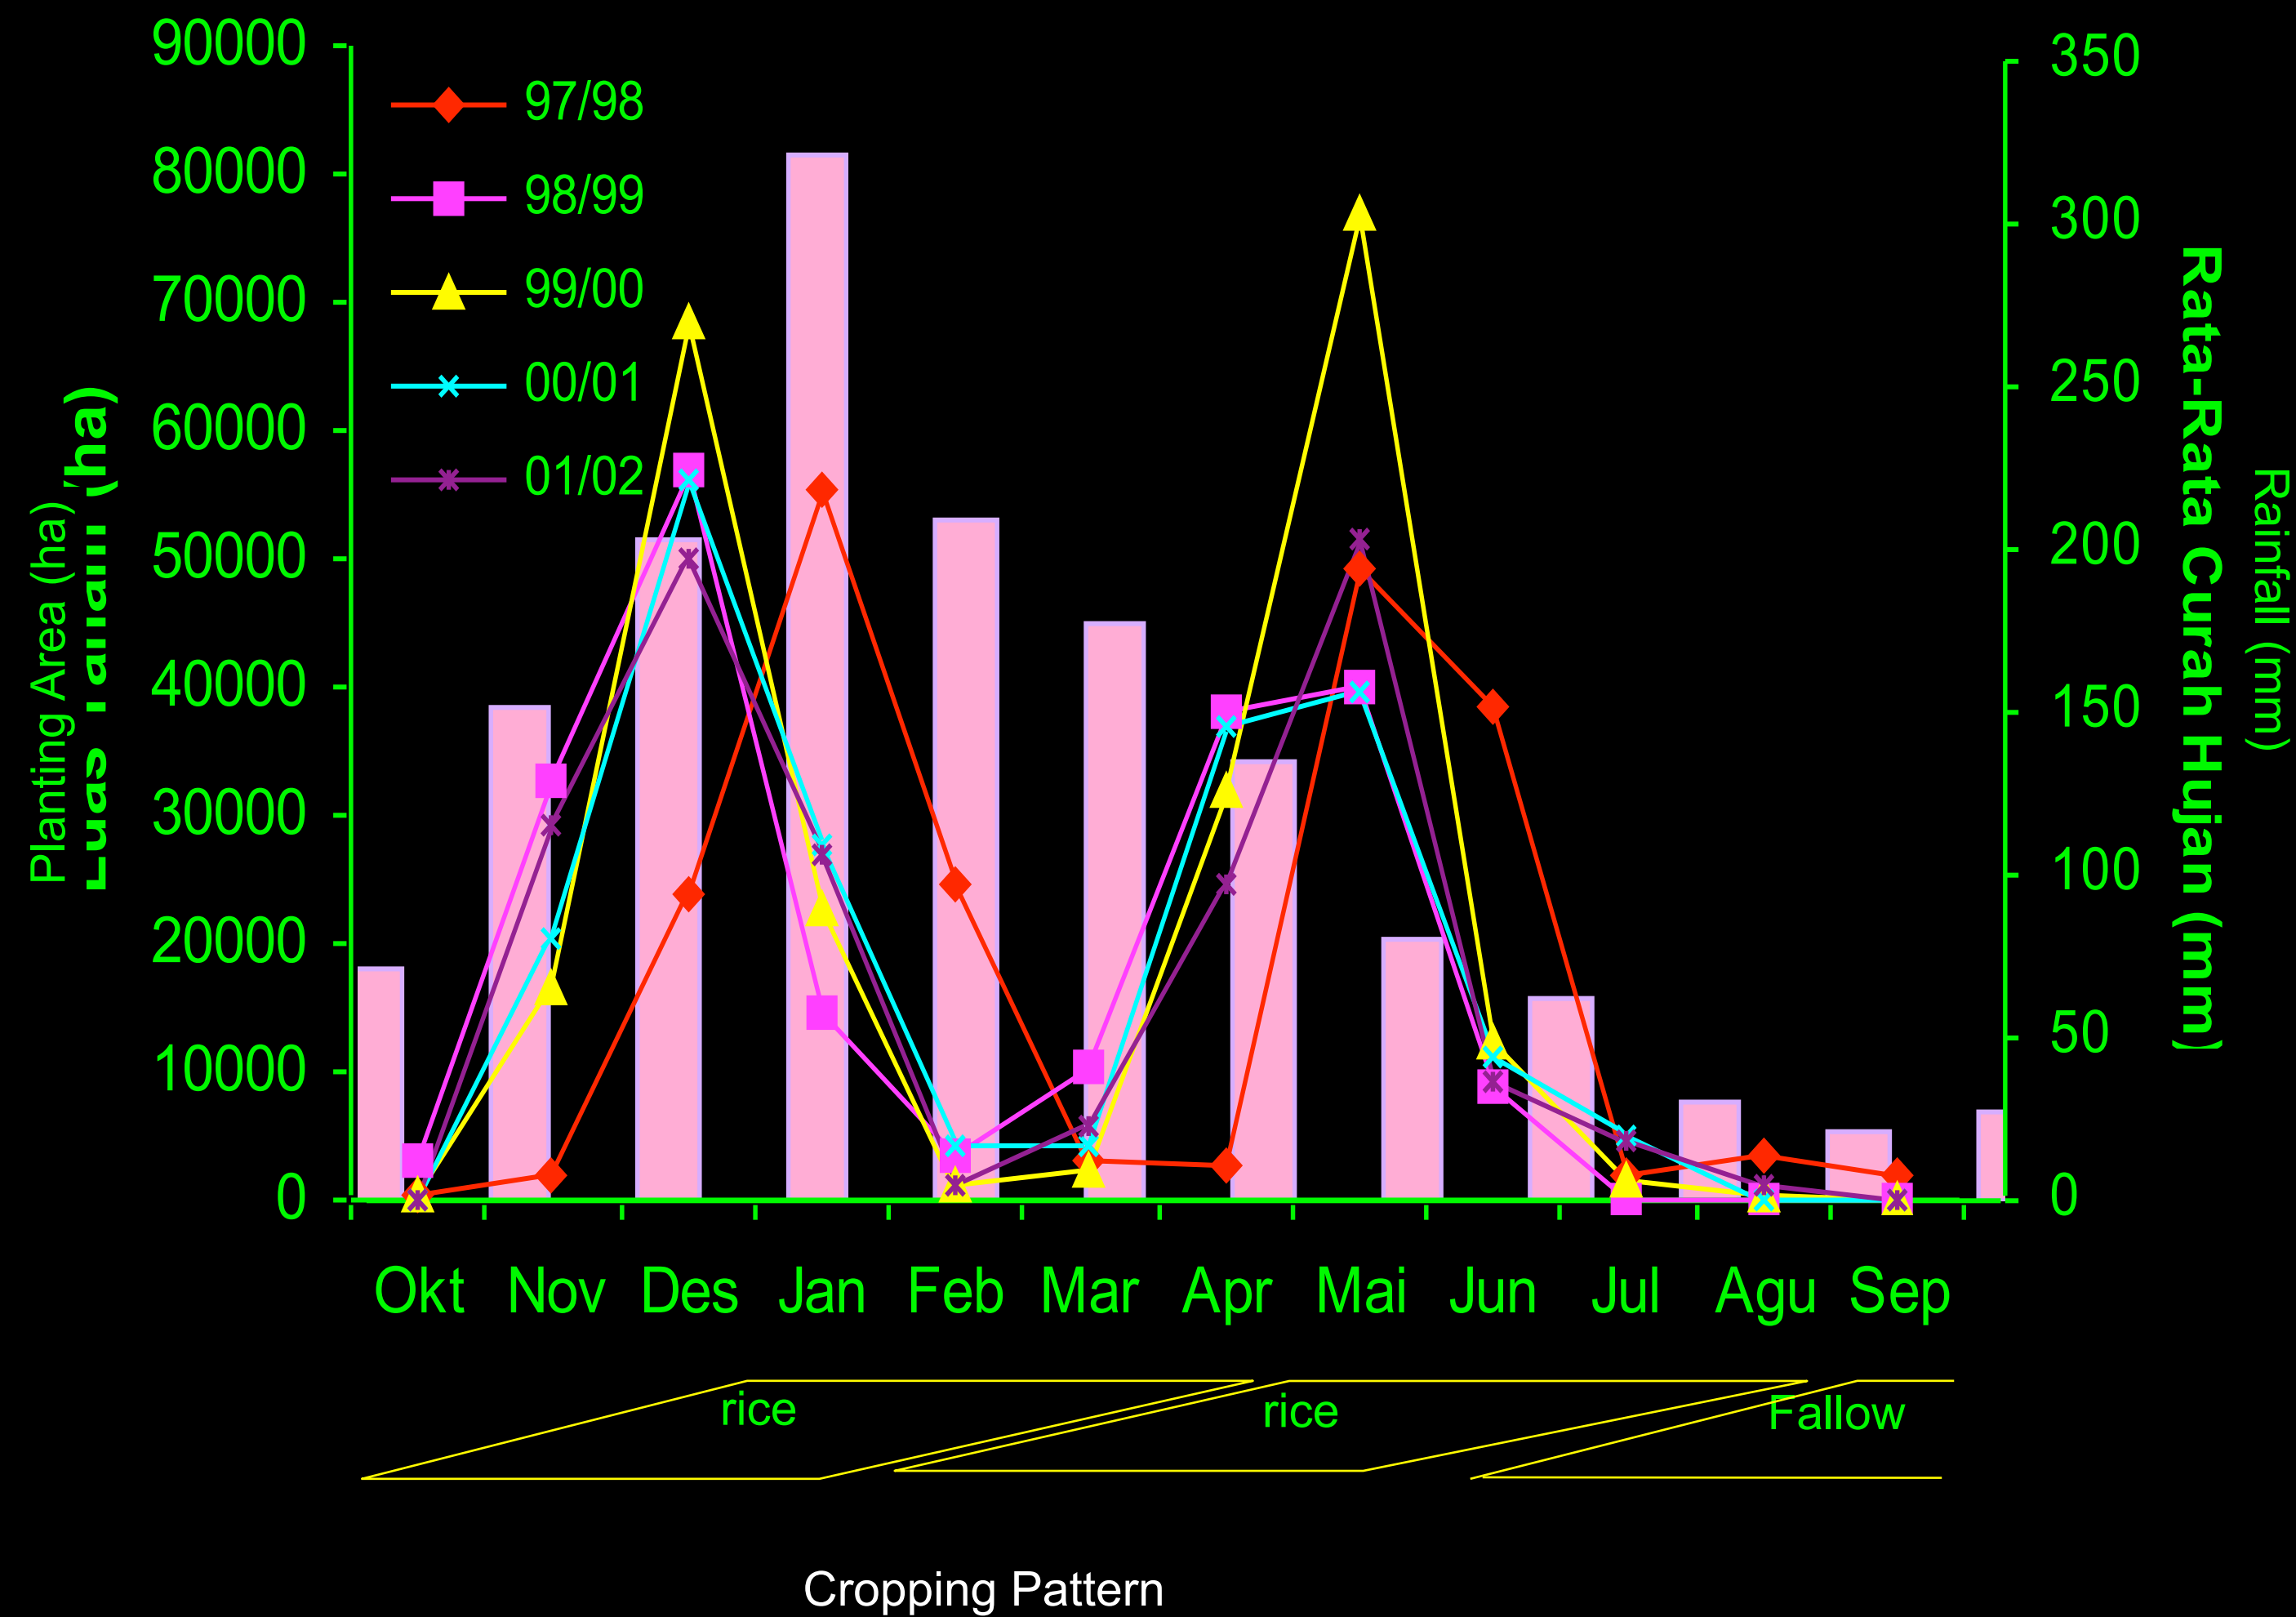

Peanut  
yields and  
rainfall in  
Gujarat,  
India

# Monsoon Onset and Rice-planting area in Indramayu, Java

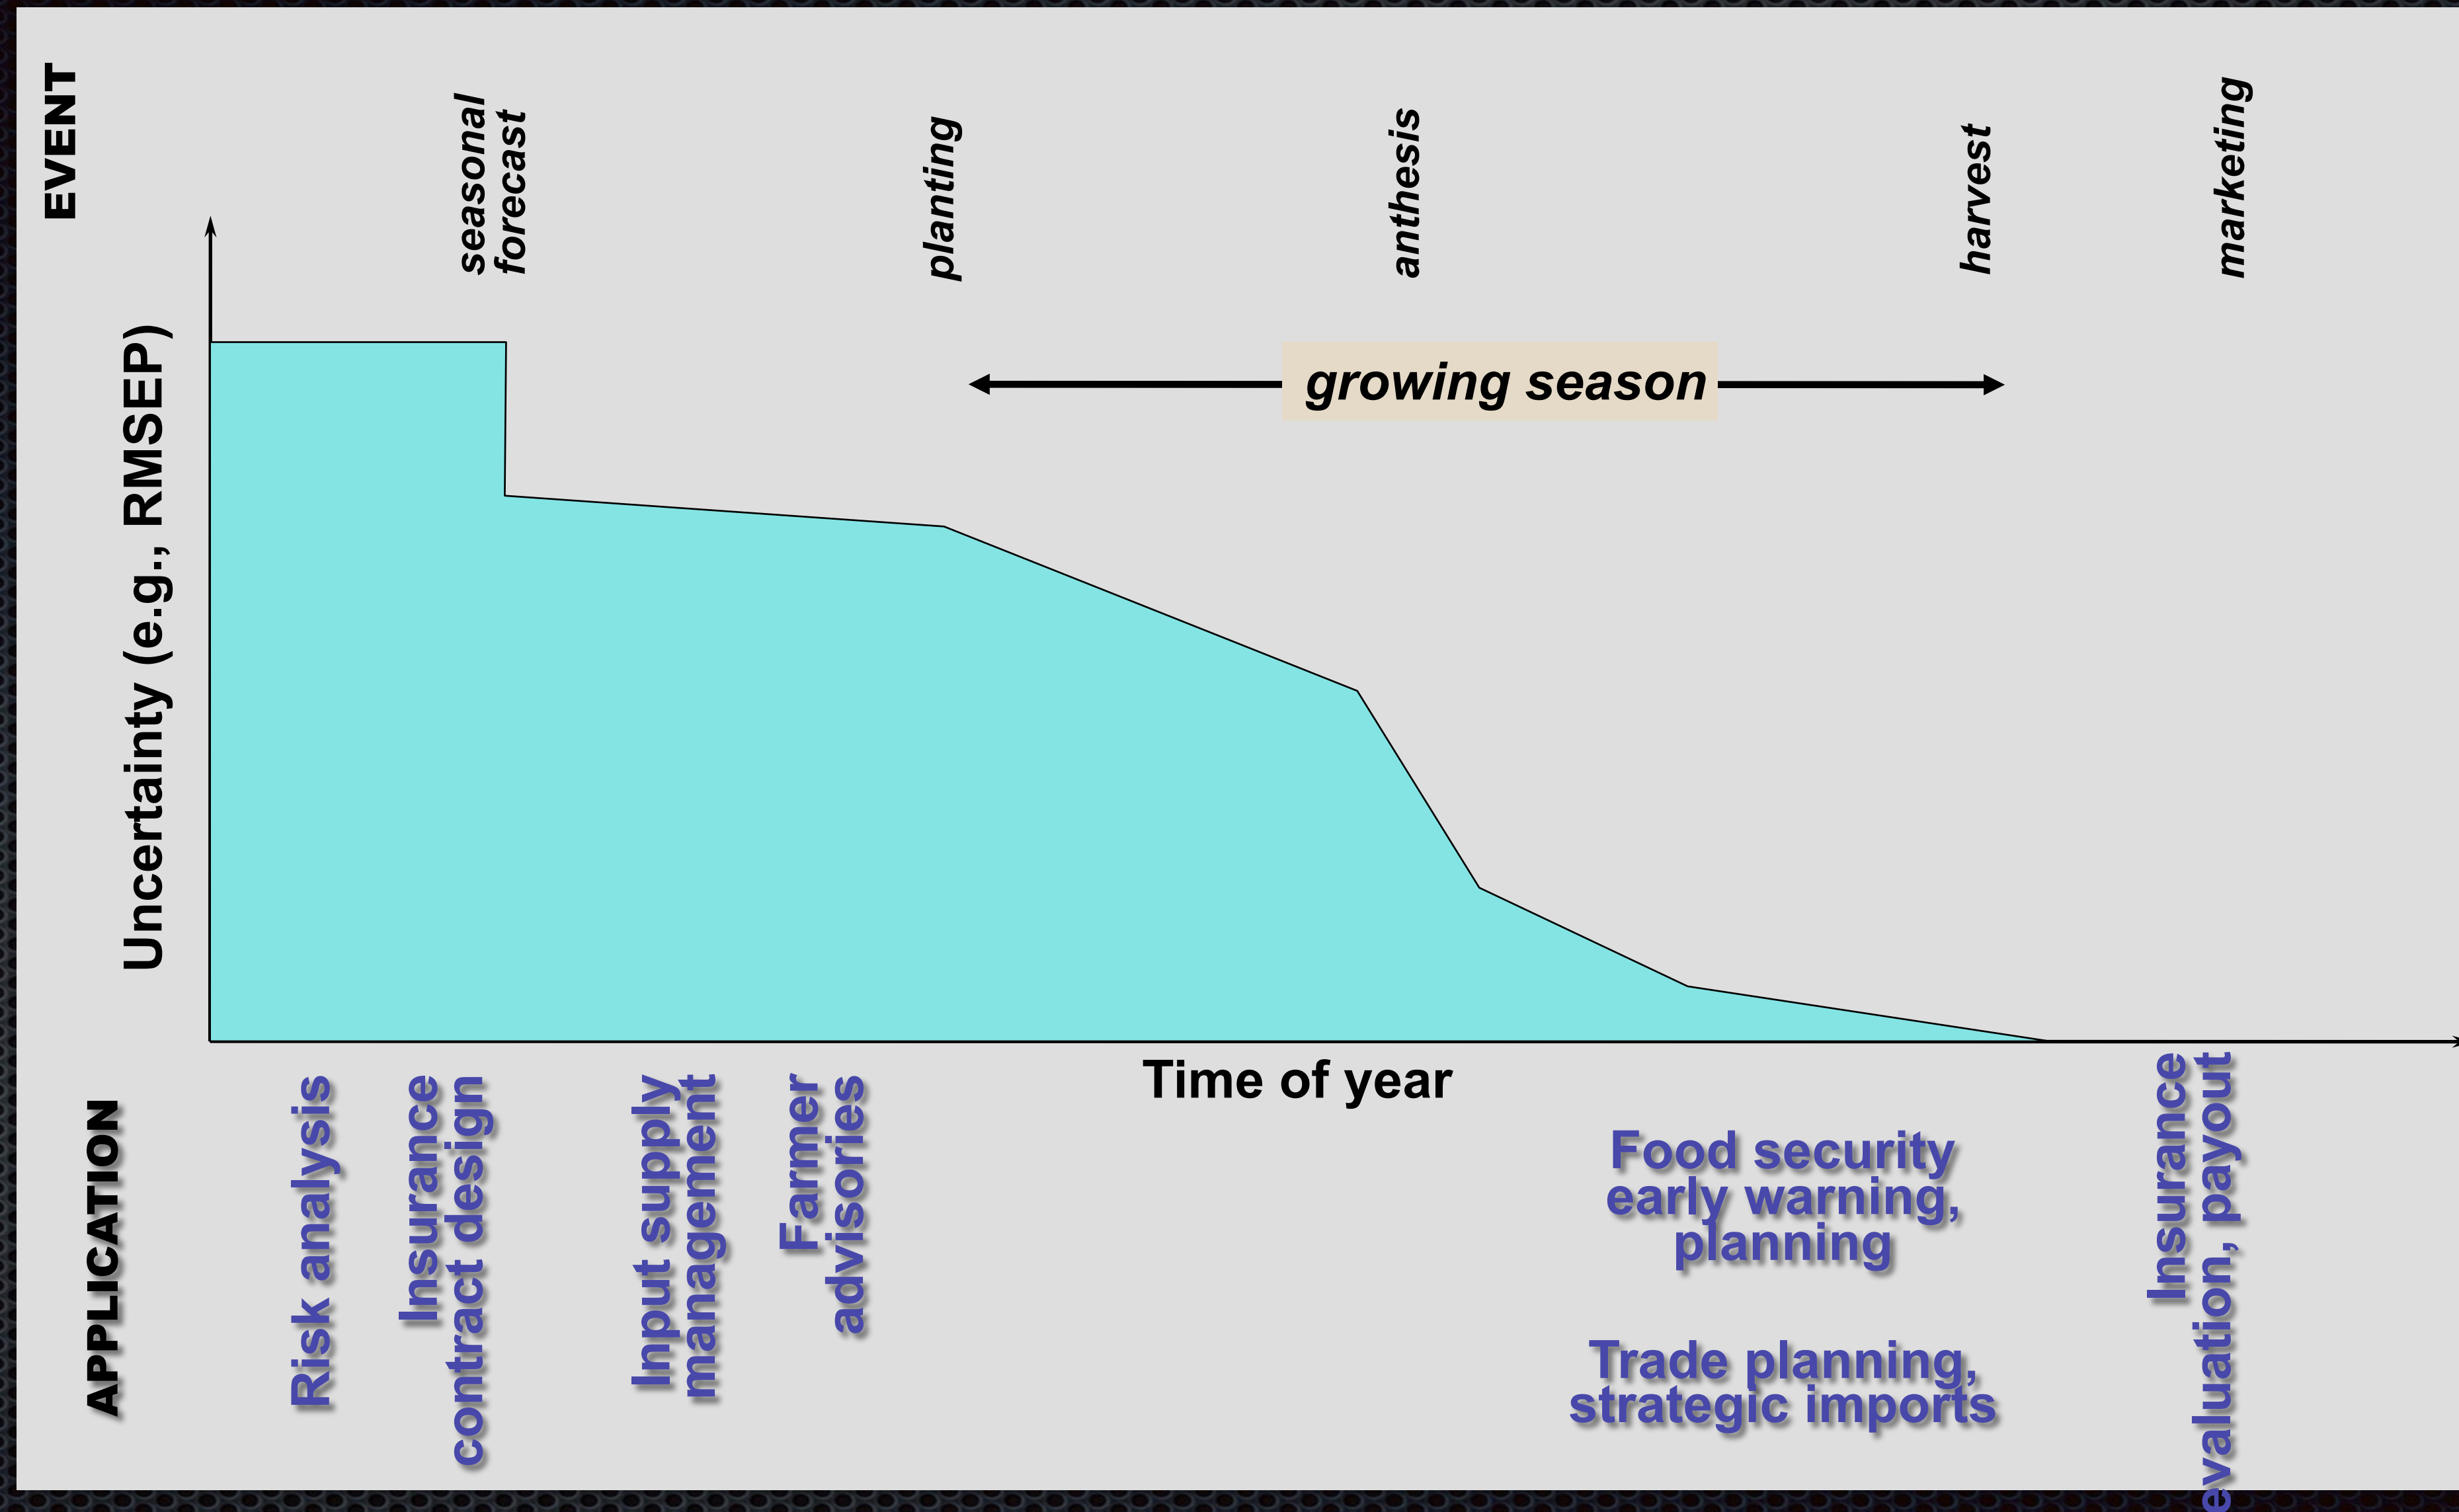

Source: Boer et al. (2004)

Start of planting changes from time to time, in planting season 97/98, start of planting delayed 1 month due to delay onset of rainfall, increasing drought risk for the second crop, except in La-Nina years

# Timeliness: The agricultural risk & planning calendar

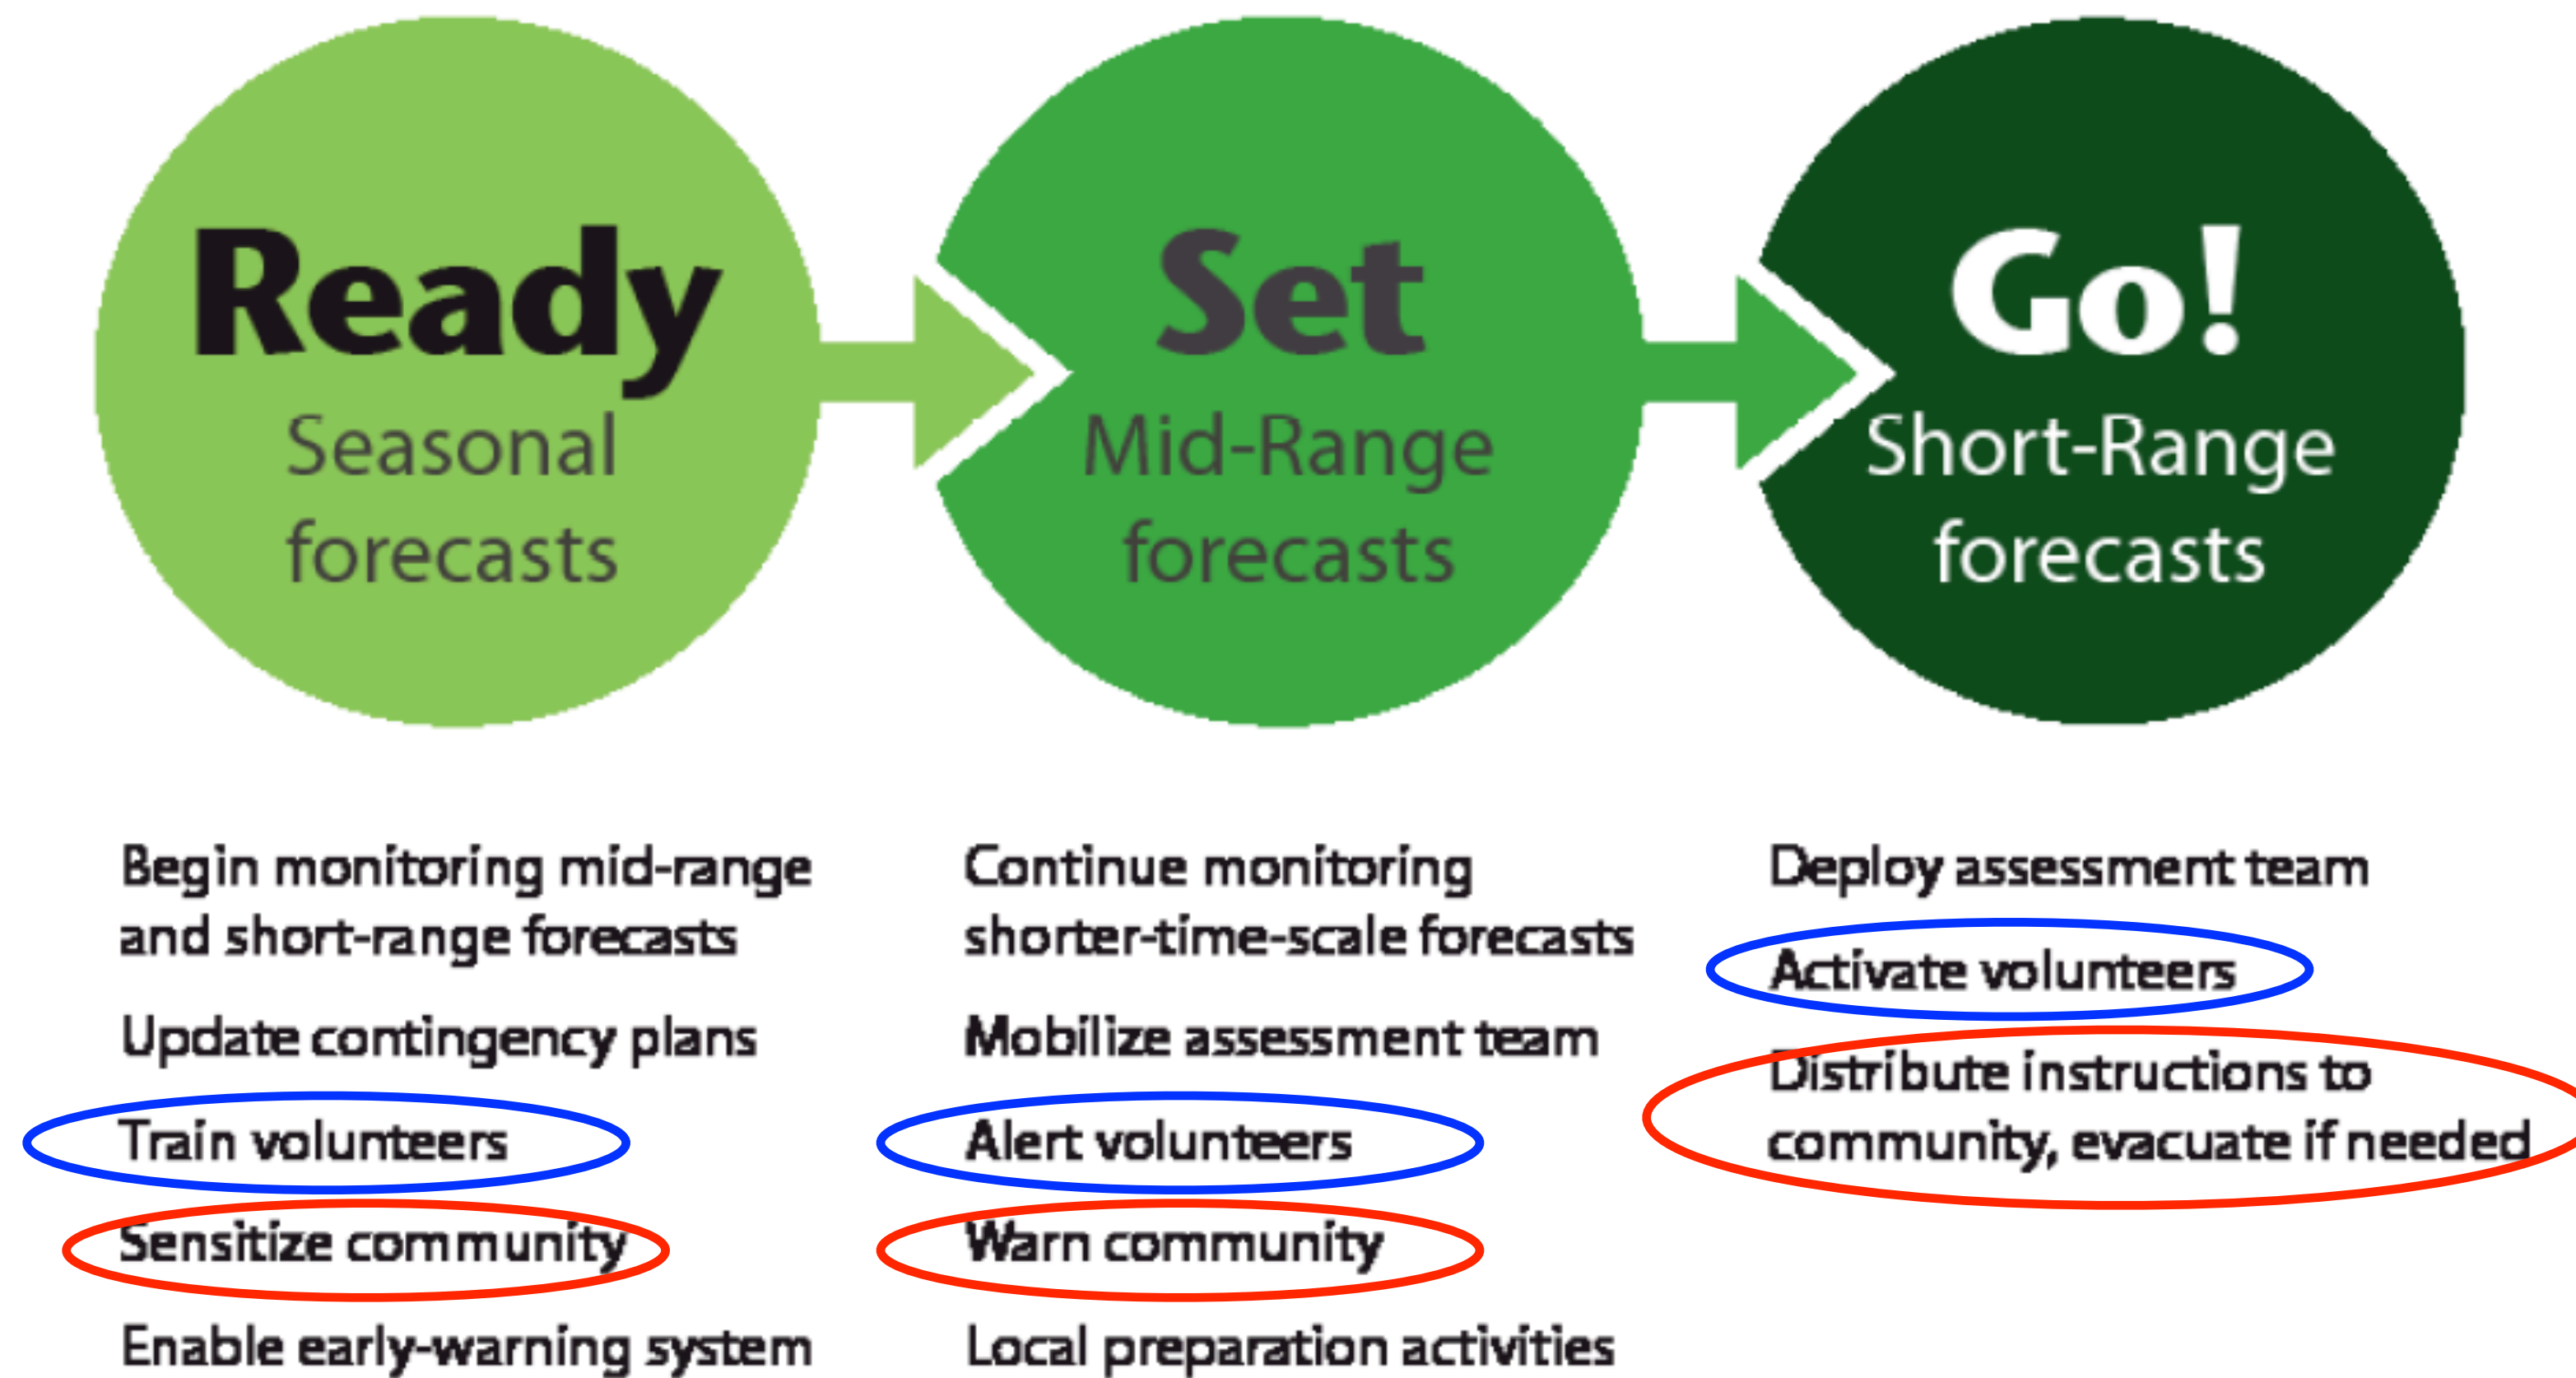

# Forecast Lead Times

# IFRC/IRI Humanitarian Aid Example

Source: M. Daly

# Using information across time-scales...

**Long  
Lead  
Time**

*more specific information*

**Short  
Lead  
Time**

Climate change  
rising risks, trends, more  
surprises

*Decades, end of century*

*more time to reduce risk*

Seasonal forecasts  
level of risk in coming months  
*next 3-6 months*

Weather forecasts  
impending hazard

*10 days or less*

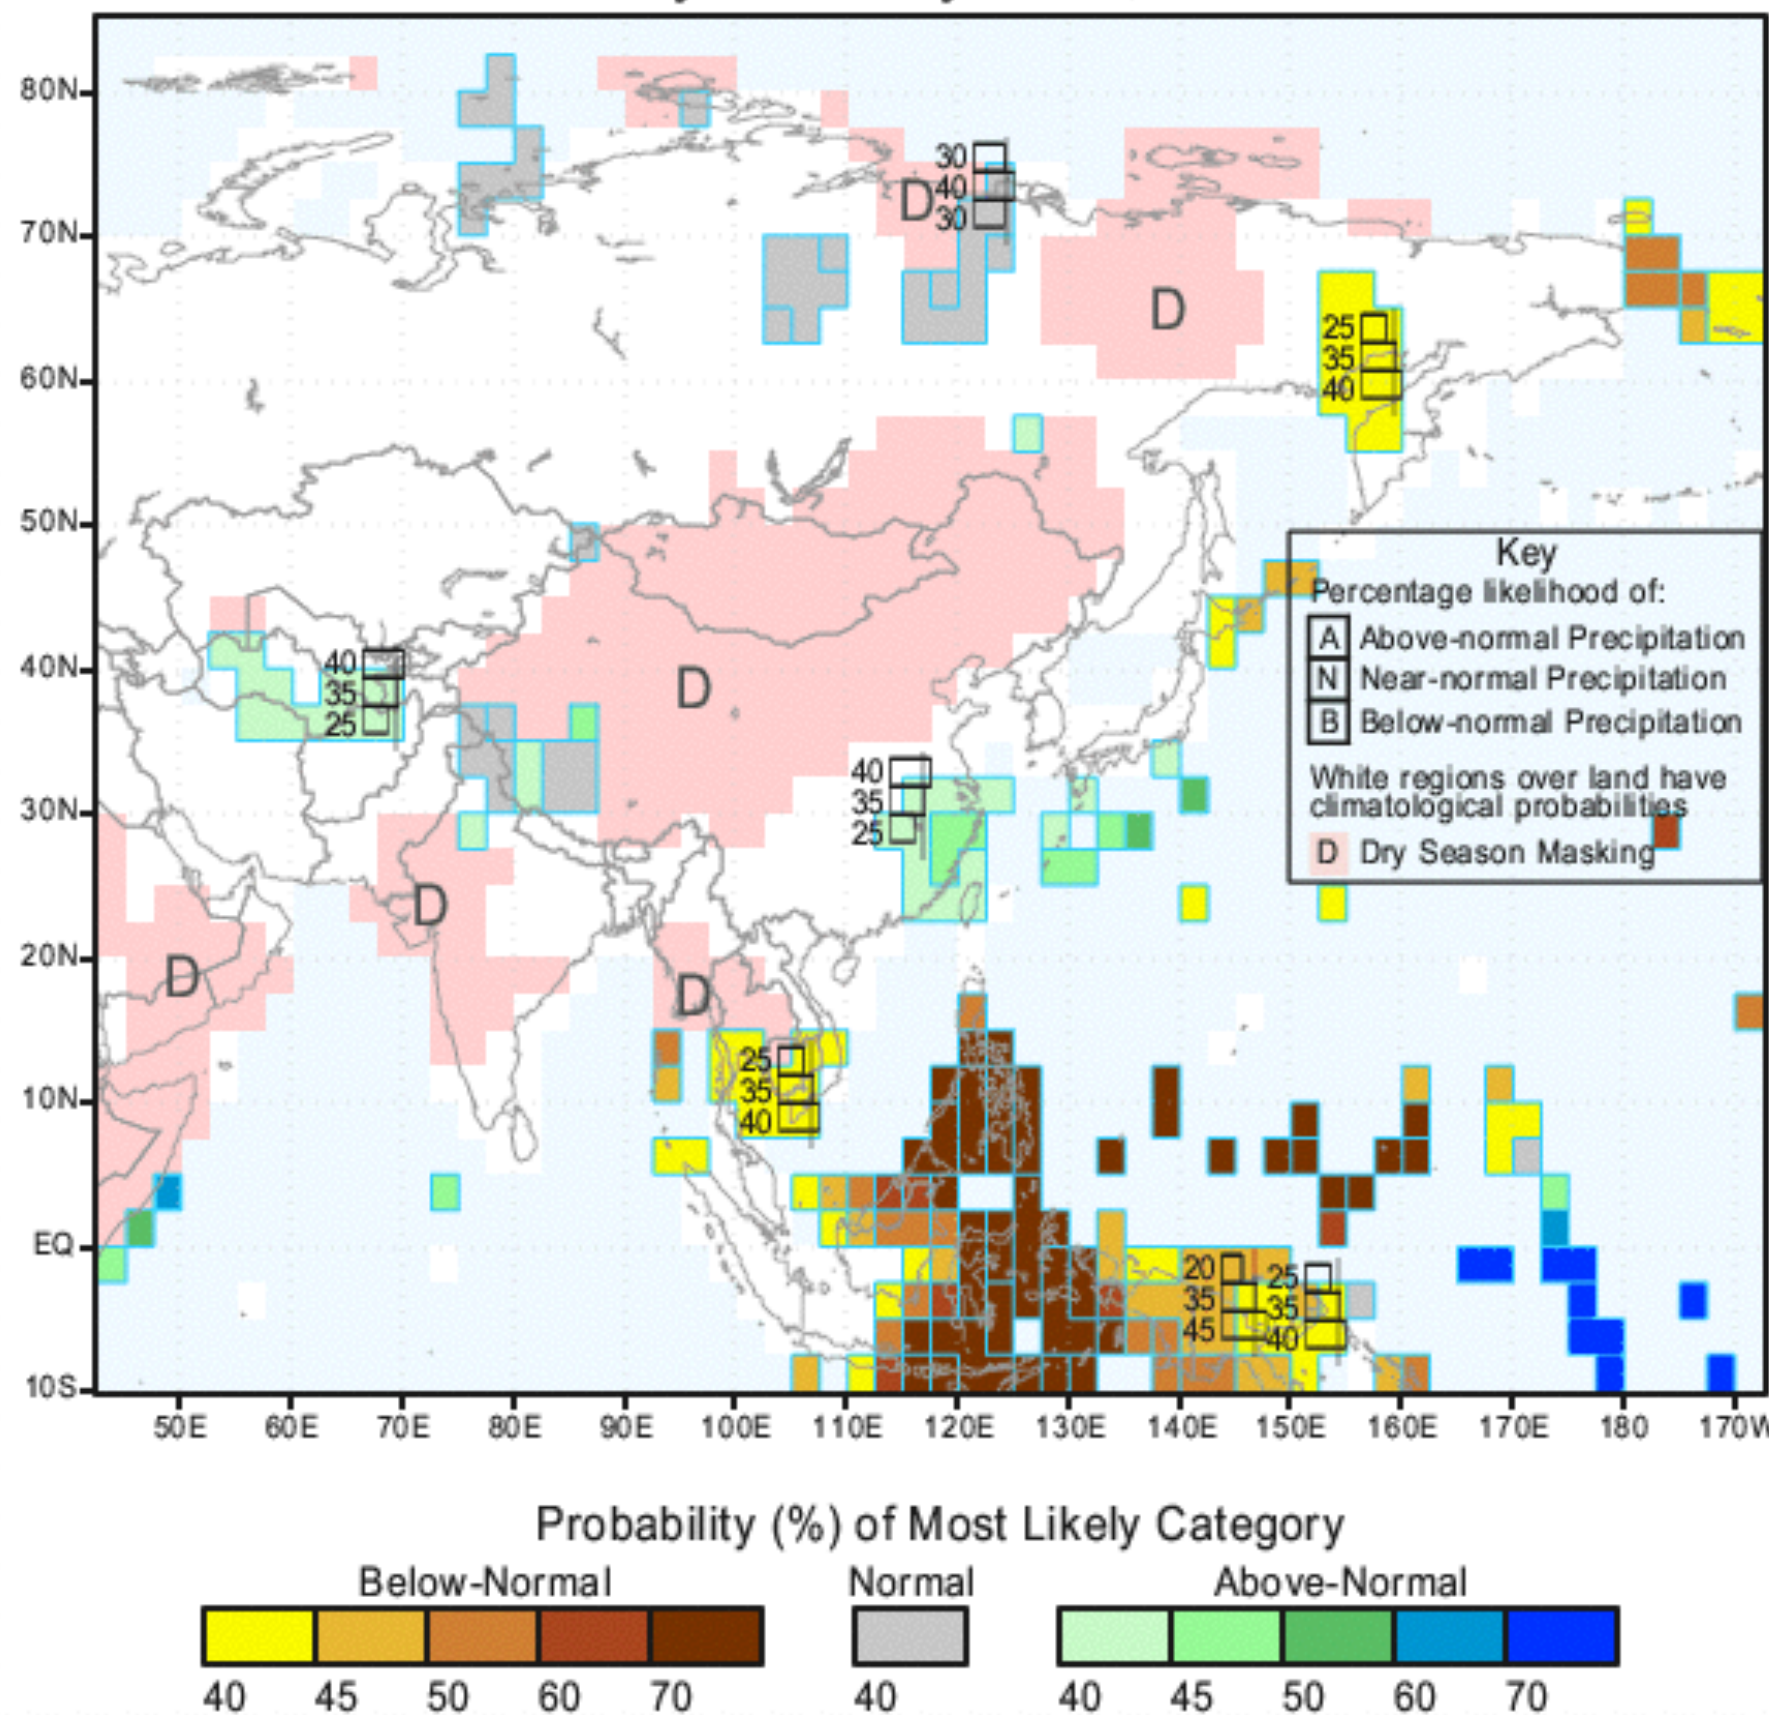

# Credibility – Can I trust the forecast?

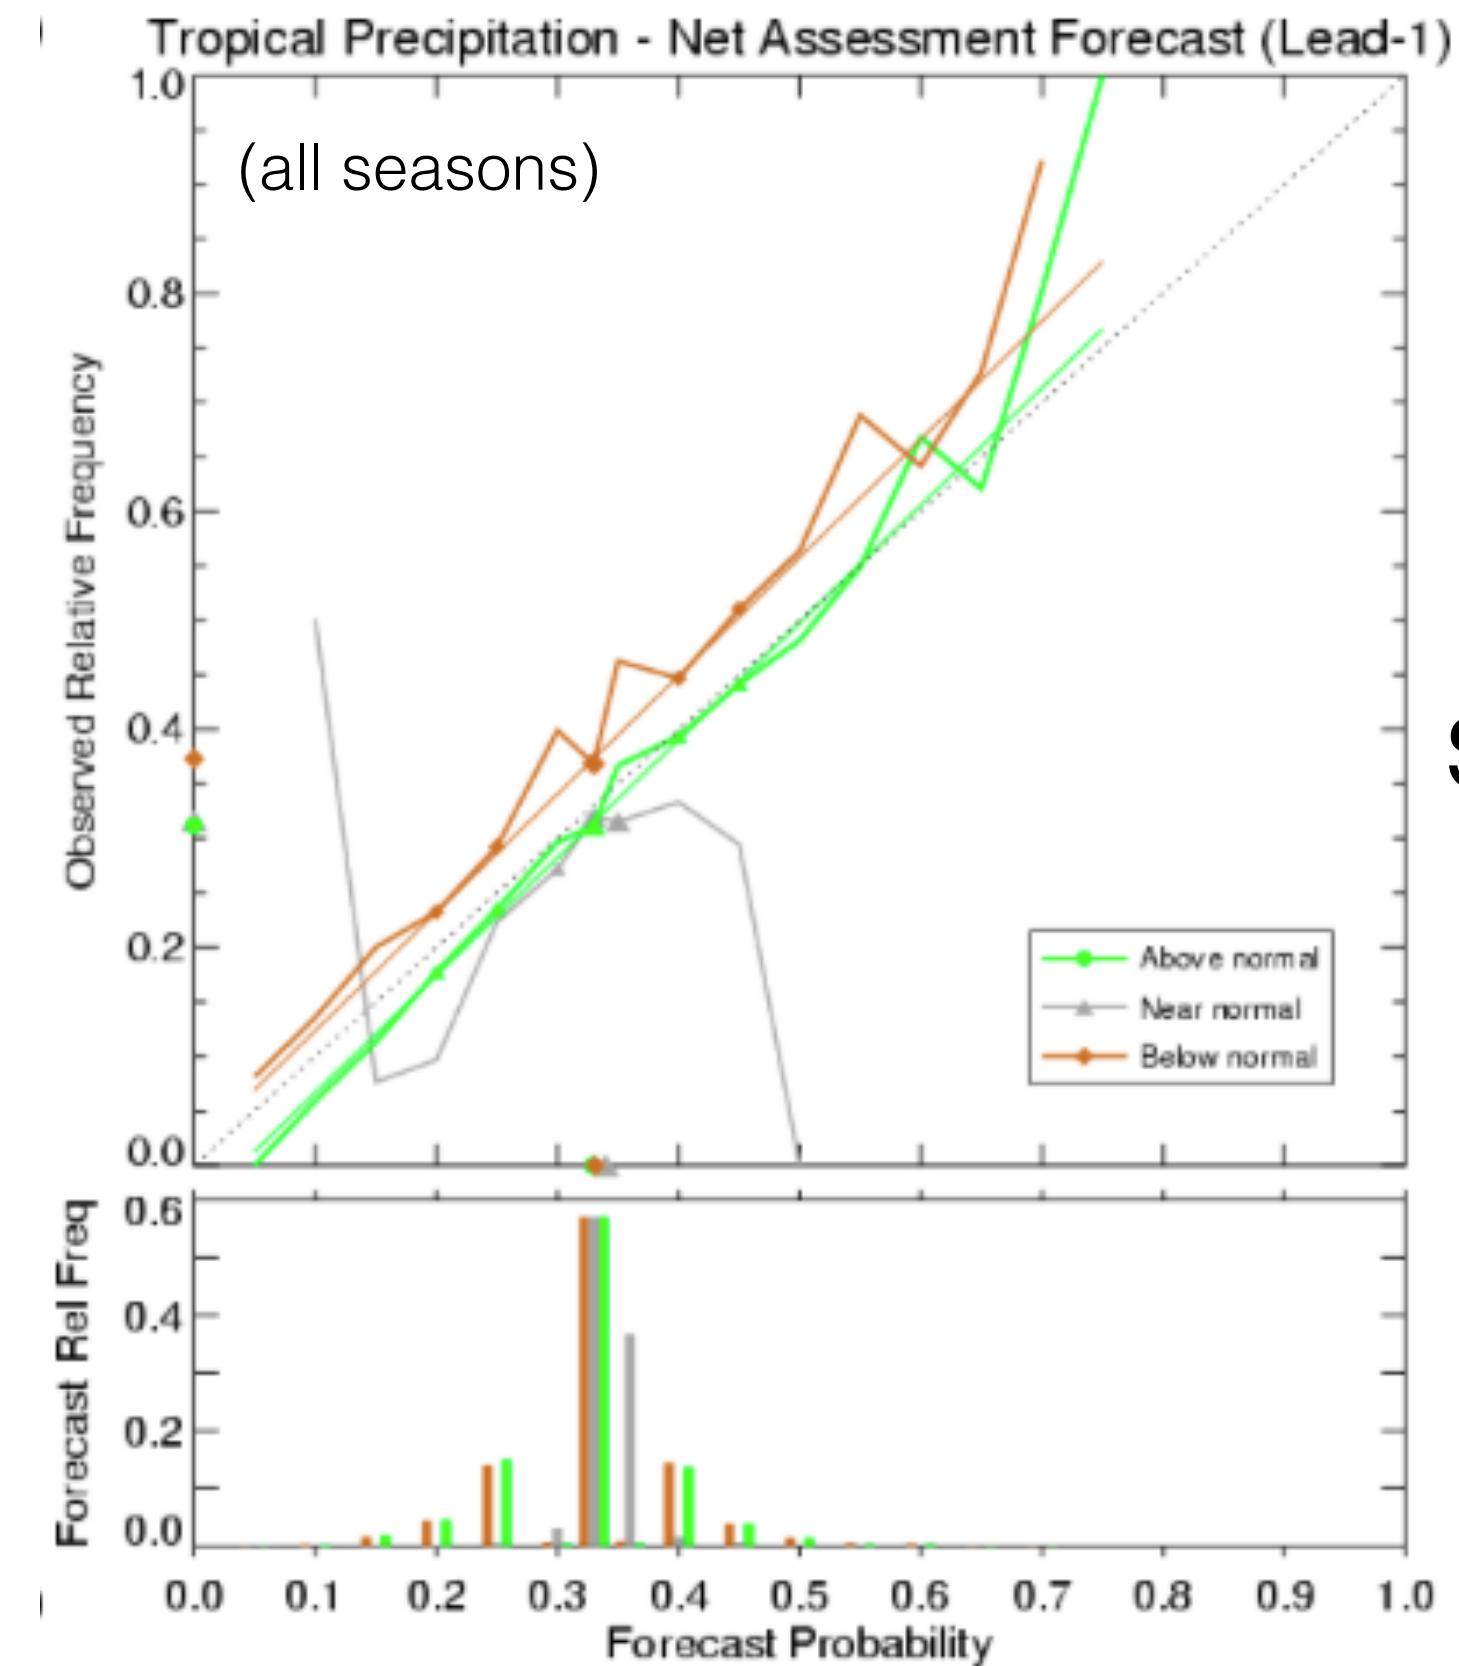

- Must be well calibrated
- Must convey forecast uncertainty: probabilistic forecasts
- User needs access to forecast verification information

# Calibration and Verification

IRI Multi-Model Probability Forecast for Precipitation  
for December-January-February 2016, Issued October 2015

Calibration:  
Forecast  
probabilities  
must be  
correct on  
average (no  
bias)

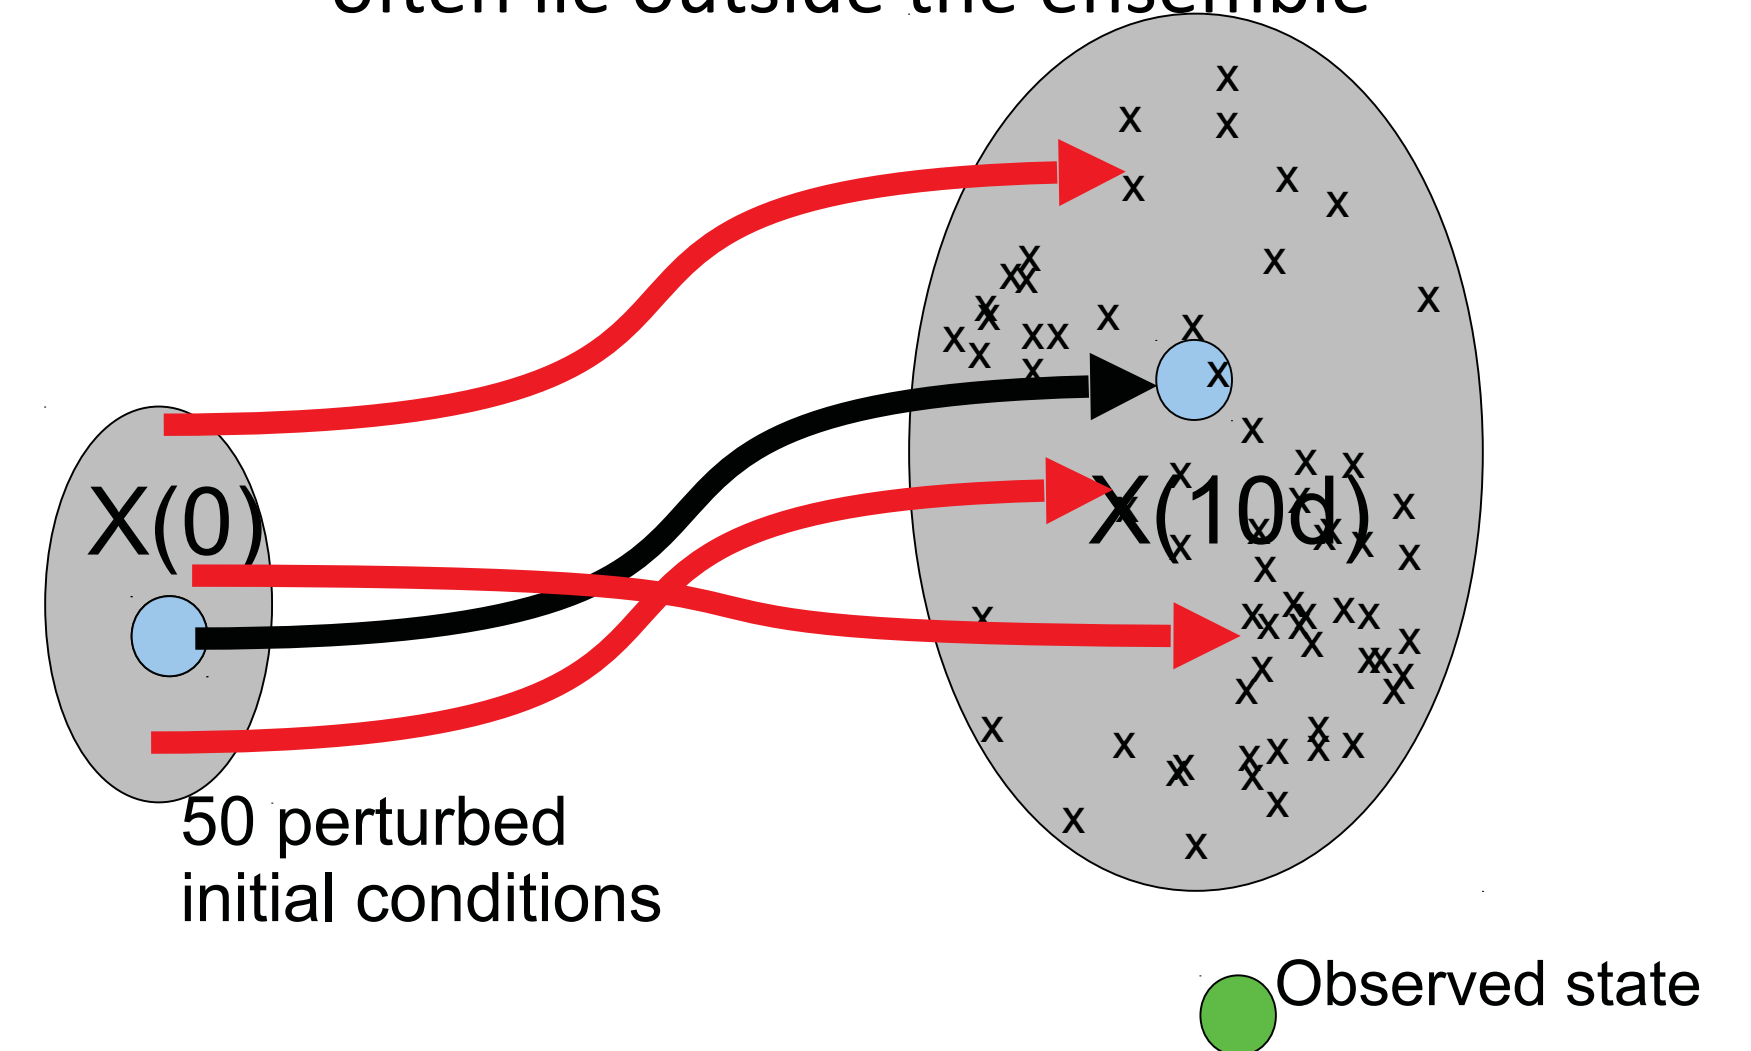

Skill information  
should be easily  
accessible

# Understandability: Probabilistic or deterministic?

- People are not used to being presented with probabilistic information
- Casual forecast users will prefer your best guess since they typically have many considerations (e.g. economic) to assimilate into their decisions
- But this conveys no information about uncertainty
- Thresholds (and probability of meeting them) can provide a user-centric probability format that makes sense

“Over-confident” forecasting system – observations often lie outside the ensemble

from Adrian Tompkins

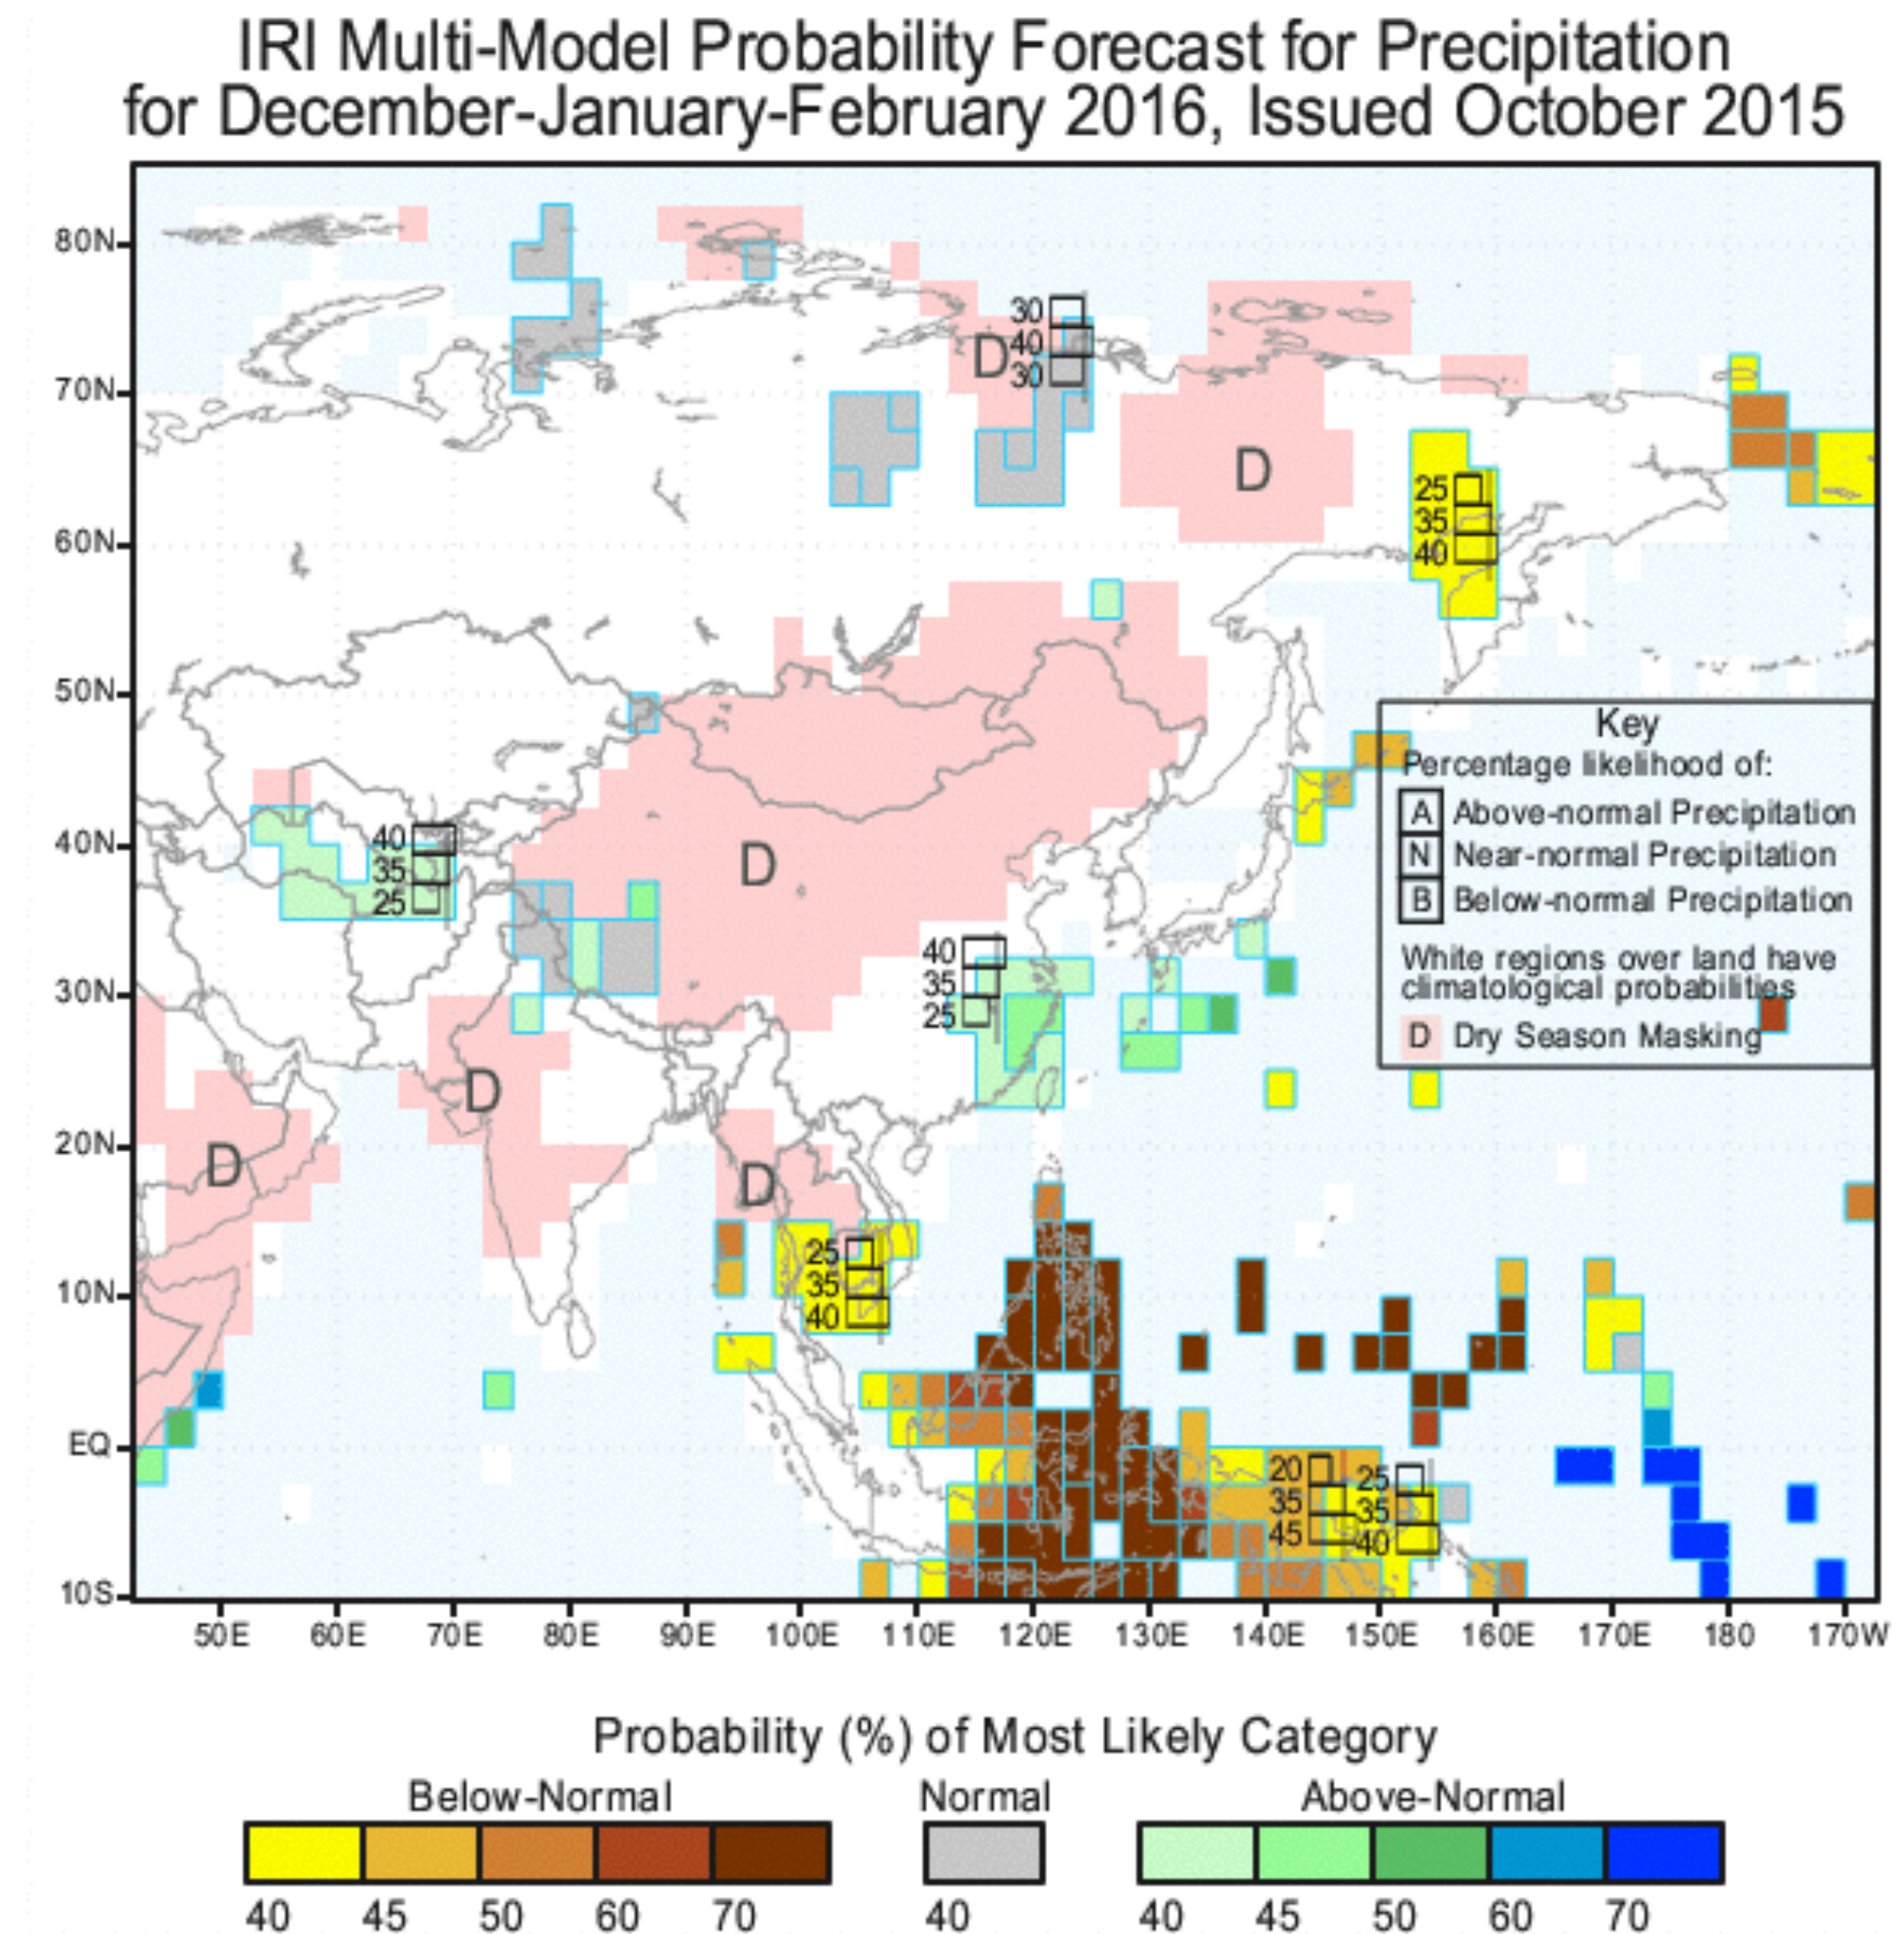

# Thresholds

- More user-specific information about the forecast distribution can be presented using thresholds
- May be more understandable than terciles

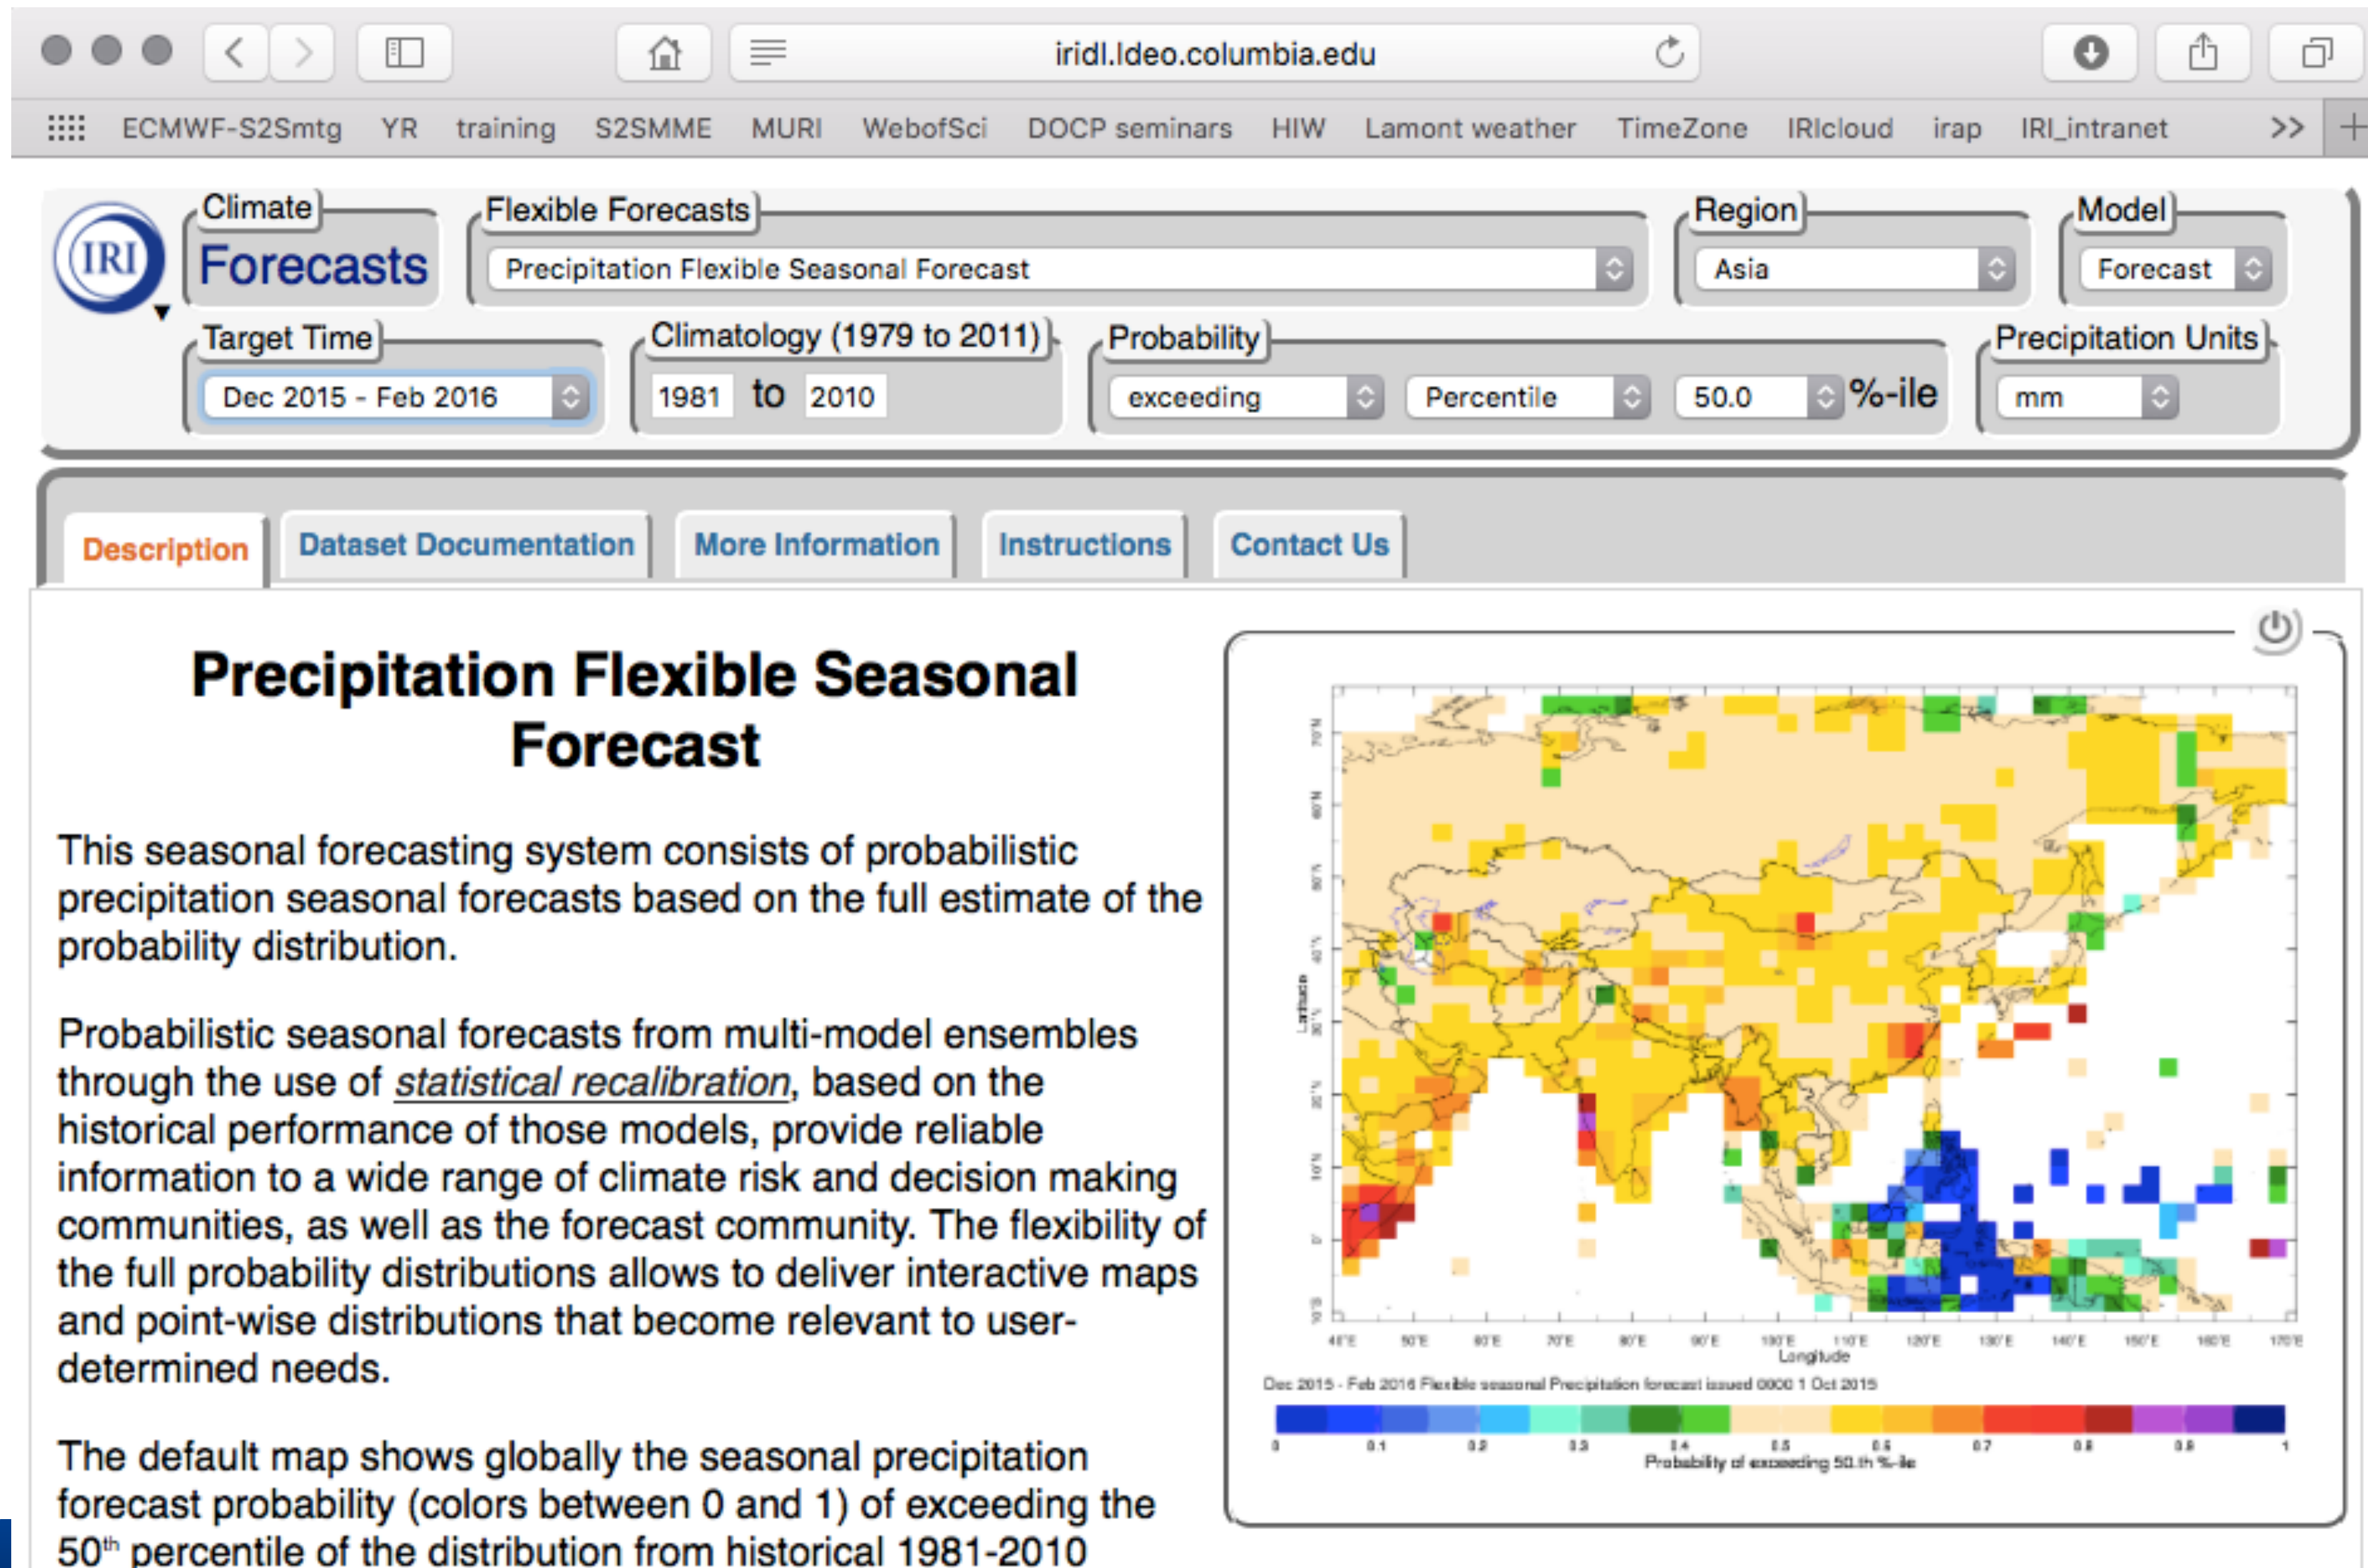

rather than this ...

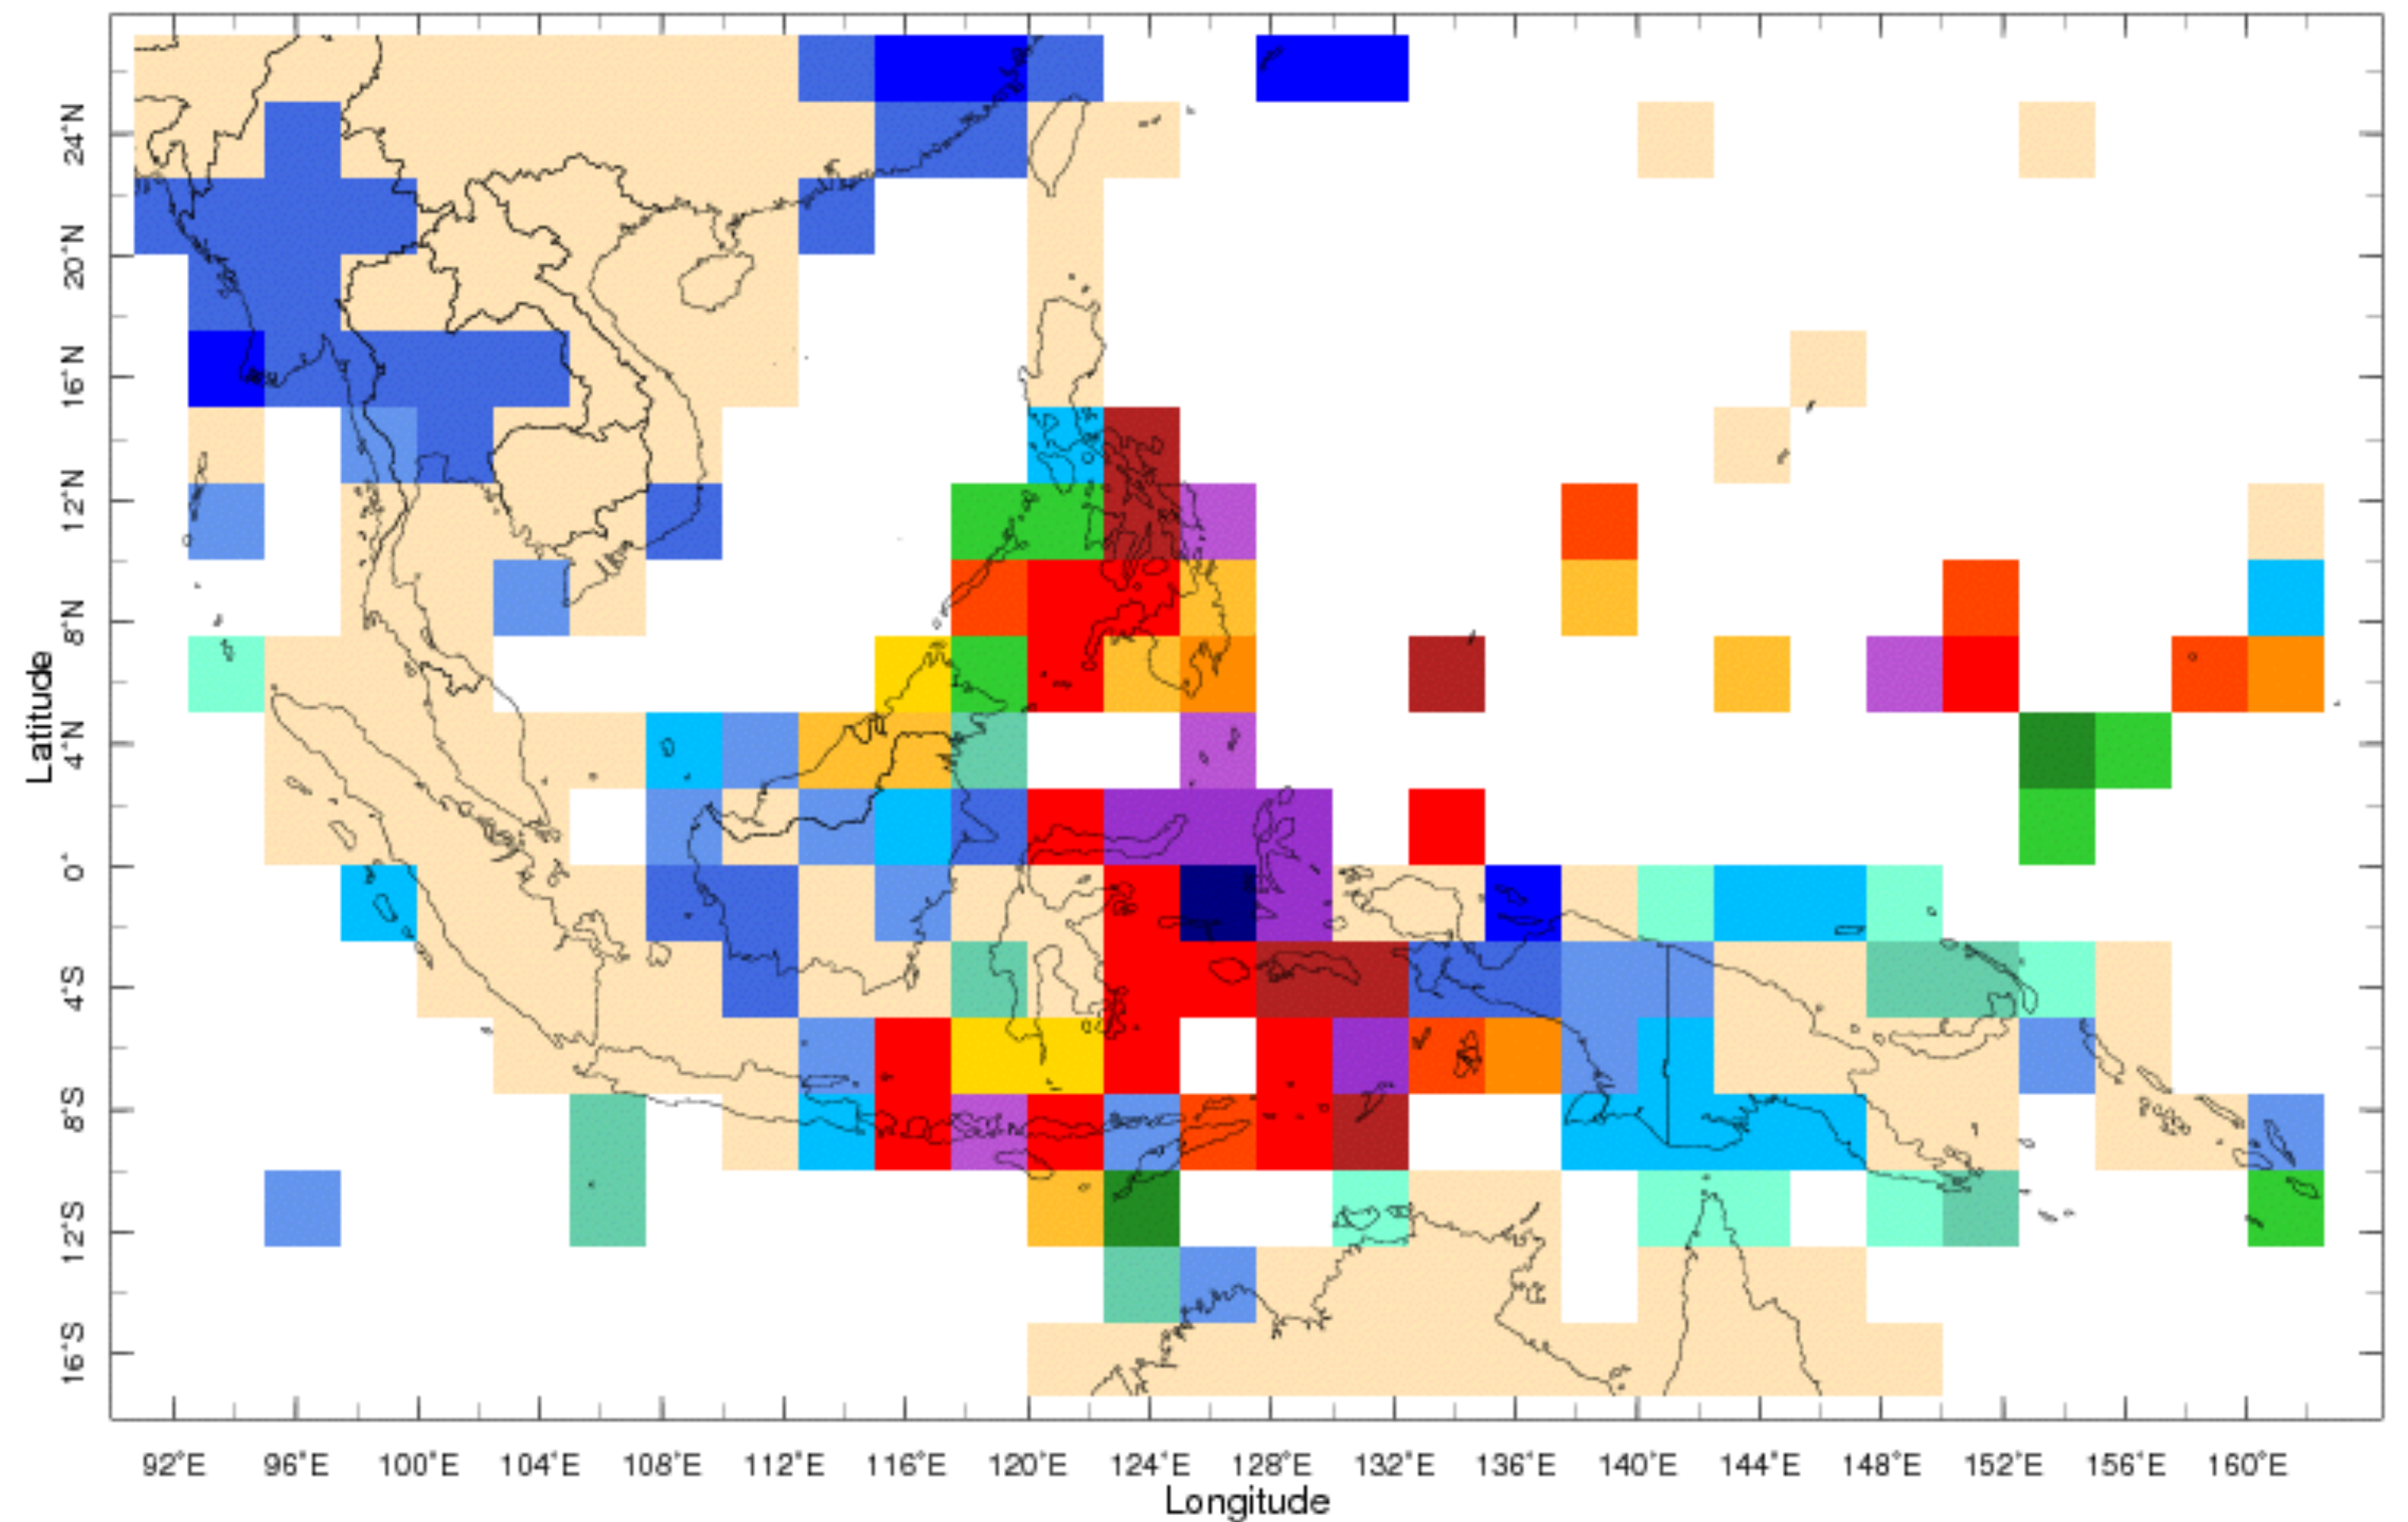

# Flexible Format Probabilistic Forecasts

# DJF Forecast: Probability of 1-in-5 year drought

Dec 2015 - Feb 2016 Flexible seasonal Precipitation forecast issued 0000 1 Oct 2015

Target Date	Issue Date	Lead Time
Dec 2015 - Feb 2016	0000 1 Oct 2015	3.5

Forecast made for [122.5E-125E, 10N-12.5N]  
located in , Ilocos , Philippines

lead 3.5 months S 0000 1 Oct 2015

Dec 2015 - Feb 2016 issued 0000 1 Oct 2015 at (123.75E,11.25N)

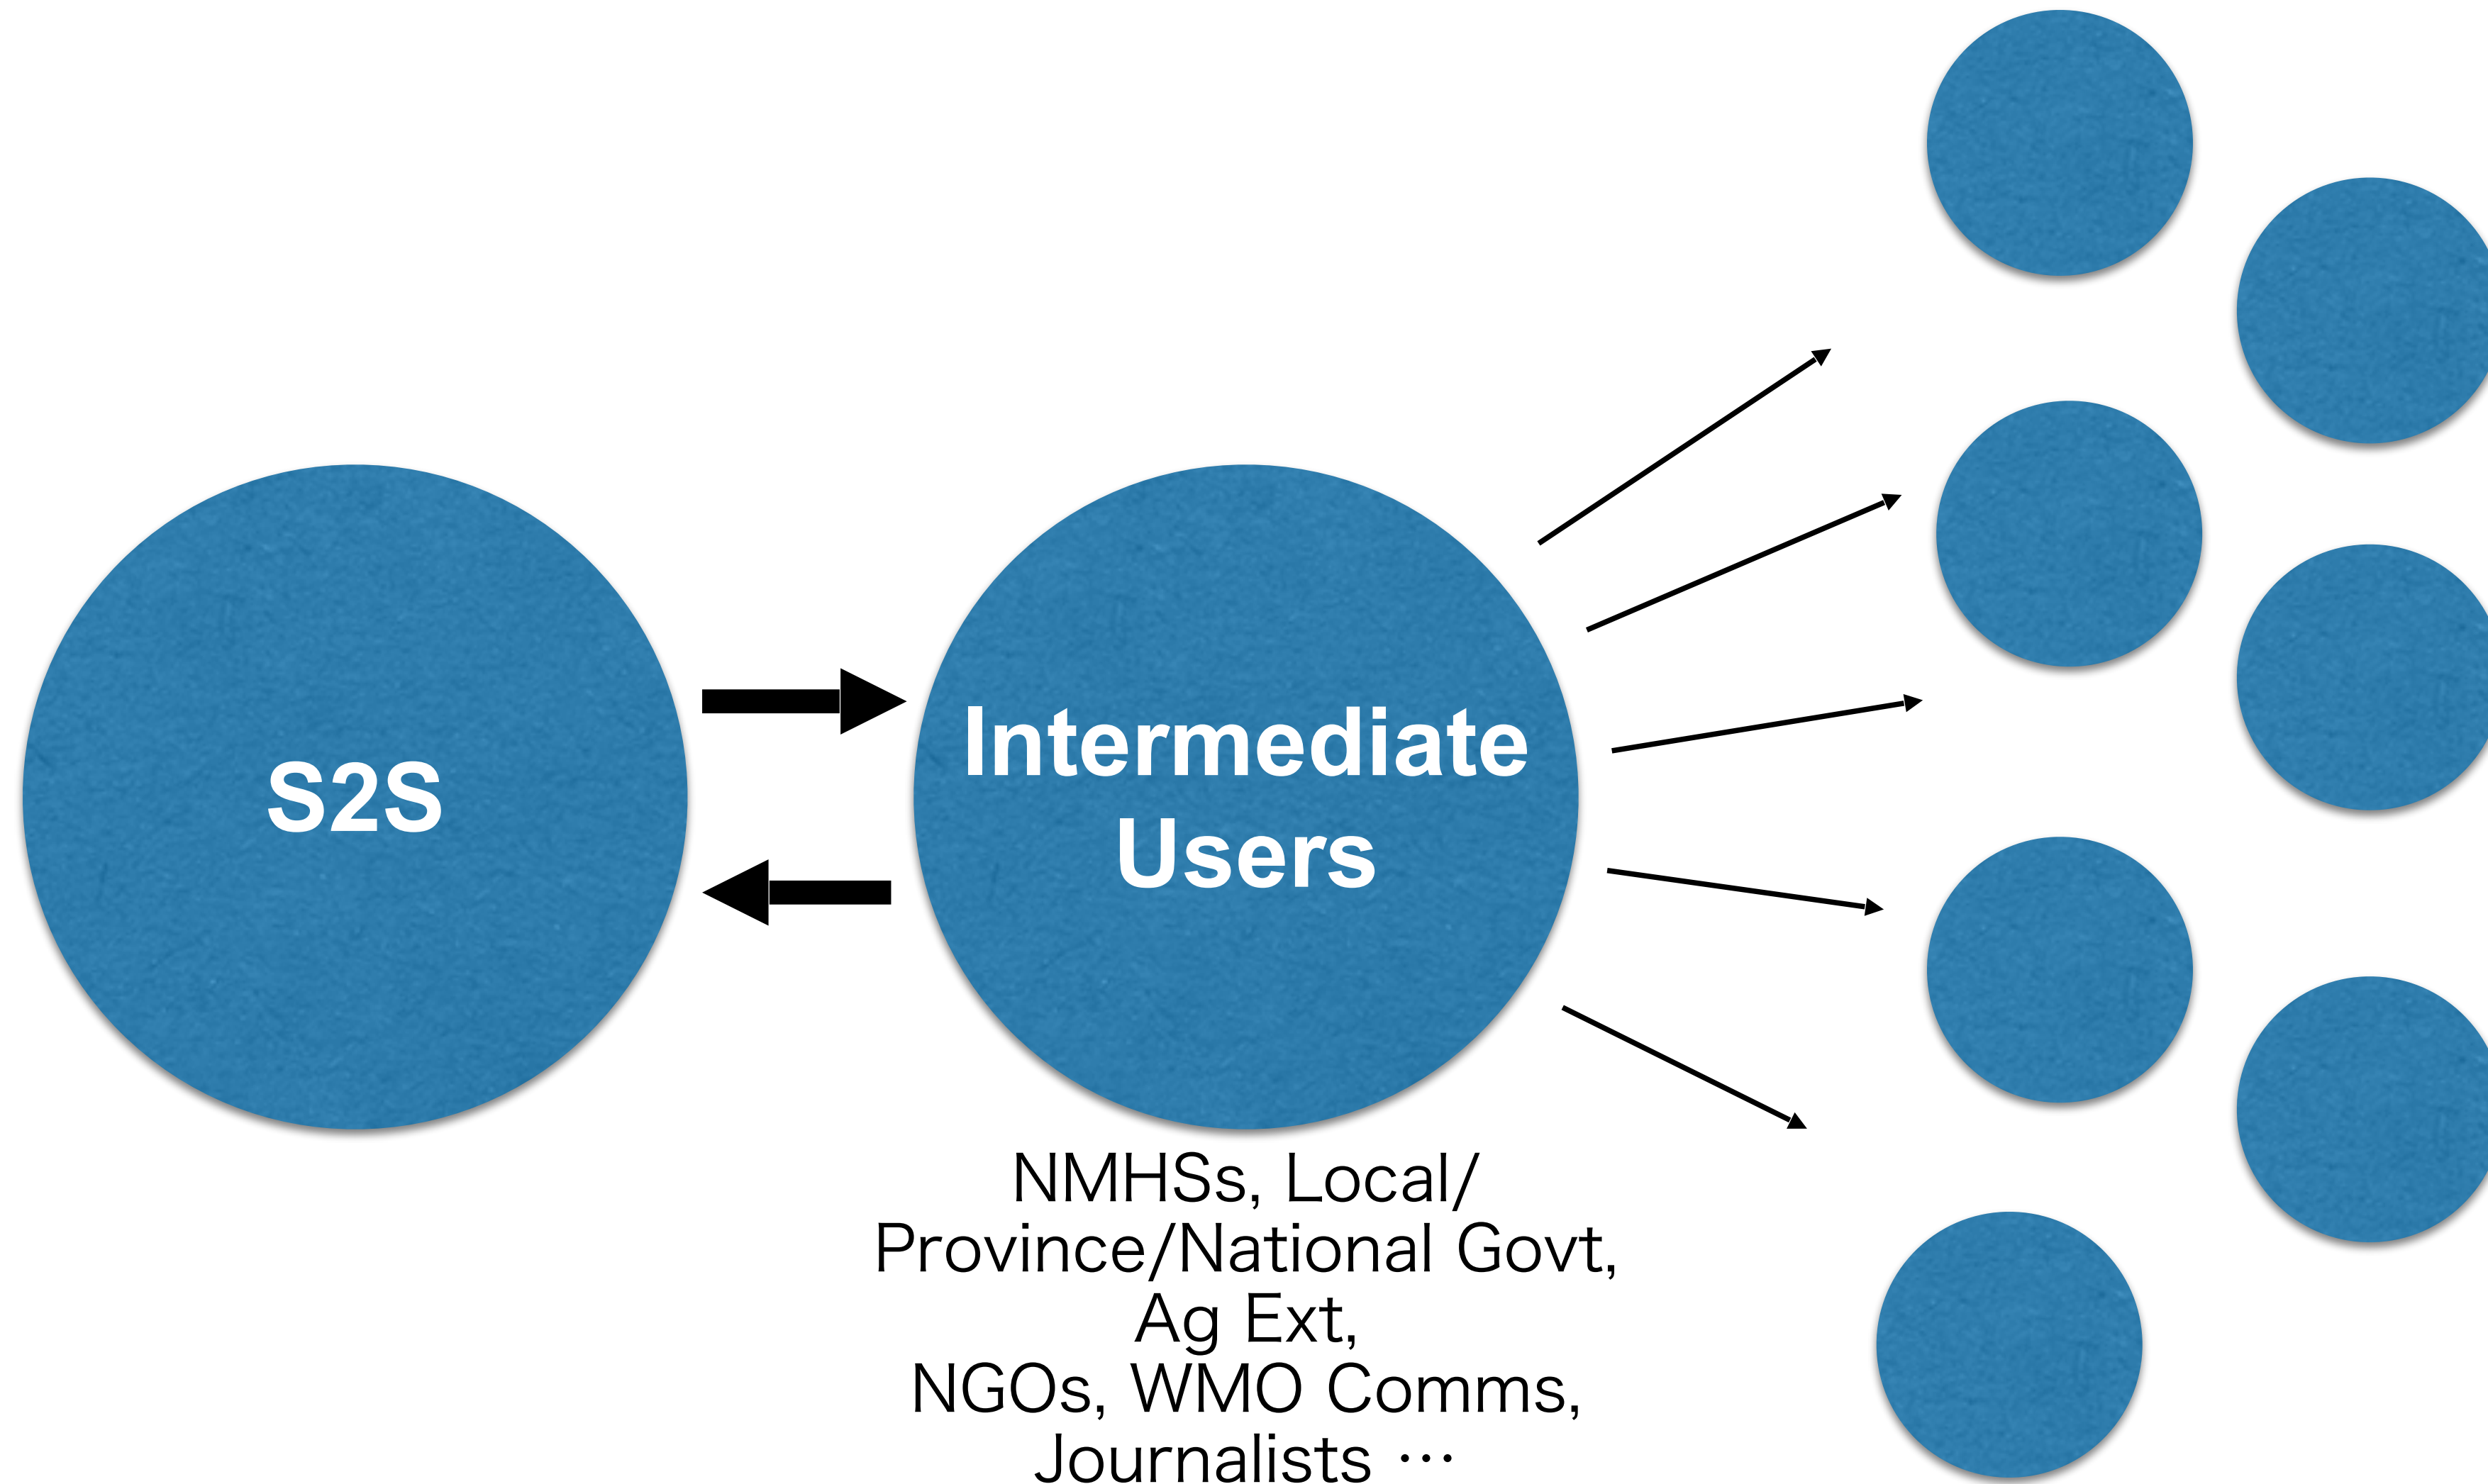

# Credibility and Understandability

- Proper dissemination of forecasts and communicating their meaning is critical
- Co-production of forecasts with intermediary agencies can help e.g. IFRC, WFP, National Met Services, Regional climate centres, agricultural extension services, agricultural universities ...
- Training courses organized by ICTP, WMO, APCC, IRI ...

	Type of information	Vehicles for delivering information	Farmer decisions affected
<b>WEATHER</b> Days to weeks	 <ul style="list-style-type: none"> <li>• Observed rainfall and temperature</li> <li>• Daily forecasts up to one week ahead of time</li> <li>• Alerts on pests and diseases</li> <li>• Early warning of extreme weather events</li> </ul>	 <ul style="list-style-type: none"> <li>• Mobile phones</li> <li>• Radio</li> <li>• Television</li> </ul>	 <ul style="list-style-type: none"> <li>• Timing of planting and harvest</li> <li>• Timing of fertilizer, pesticide, and irrigation application</li> <li>• Protecting lives and property from extreme events</li> </ul>

# Important Entry Points with Users

Indirect Link with End Users via Intermediaries

# Maprooms for Humanitarian Aid

*developed in a partnership  
between IRI and IFRC*

Source: IRI

# Legitimacy

- The forecasts need to come from a trusted source
- In the WMO system, the National Met Services play this role
- The WMO Lead Centre is the intermediary between global producing centers (GPCs) and the NMSs

# Outlook

Can a [S2S]  
climate forecast  
help farmers  
avoid harm and  
disaster?

Or take  
advantage of a  
good year?

# Summary of main points

- “Applications” is a highly multi-faceted area
- Much hinges on effective communication of what forecasts can and can't say. This includes training.
- Proper calibration and verification become critical for people to be able to act on a forecast
- There is much to be done on all the above in the new field of seamless forecasting!
