## OPERATORS

### INCREMENT AND DECREMENT

#### PRE-INCREMENT

#### PRE- DECREMENT

#### POST- INCREMENT

#### POST- DECREMENT

### COMPOUND STATEMENT

### LOOPS

### BREAK & CONTINUE

### LABEL & GOTO

### EXERCISES

`++` is the increment operator.

Increment operator increases the value of a variable by 1.

`--` is the decrement operator.

Decrement operator decreases the value of a variable by 1.

`x ++` is equivalent to `x = x + 1;`

`y --` is equivalent to `y = y - 1;`

# Operators

---

```

1 #include <stdio.h>
2
3 int main()
4 {
5     int i=10;
6     i++;
7     printf("\n%d\n", i);
8
9     float k=23.7;
10    k++;
11    printf("\n%f\n", k);
12
13    char m='C';
14    m--;
15    printf("\n%c\n", m);
16
17 }
```

IN PRE-INCREMENT: variable increment by 1 before  
assignment

#### PRE-INCREMENT

```
1 y=++x;
```

#### EQUIVALENT LINES OF CODE

```
1 x=x+1;  
2 y=x;
```

```
1 #include <stdio.h>  
2  
3 int main()  
4 {  
5     int x=5;  
6     int y=10;  
7  
8     printf("\nBefore y=++x:  x=%d and y=%d\n",x,y);  
9     y=++x;  
10    printf("\nAfter   y=++x:  x=%d and y=%d\n",x,y);  
11 }
```

---

IN PRE-DECREMENT: variable decrement by 1 before assignment.

#### PRE-DECREMENT

```
1 y=--x;
```

#### EQUIVALENT LINES OF CODE

```
1 x=x-1;  
2 y=x;
```

```
1 #include <stdio.h>  
2  
3 int main()  
4 {  
5     int x=5;  
6     int y=10;  
7  
8     printf("\nBefore y=--x:  x=%d and y=%d\n",x,y);  
9     y=--x;  
10    printf("\nAfter  y=--x:  x=%d and y=%d\n",x,y);  
11 }
```

IN POST-INCREMENT: variable assignment before increment  
by 1.

#### POST-INCREMENT

```
1 y=x++;
```

#### EQUIVALENT LINES OF CODE

```
1 y=x;  
2 x=x+1;
```

```
1 #include <stdio.h>  
2  
3 int main()  
4 {  
5     int x=5;  
6     int y=10;  
7  
8     printf("\nBefore y=x++: x=%d and y=%d\n",x,y);  
9     y=x++;  
10    printf("\nAfter y=x++: x=%d and y=%d\n",x,y);  
11 }
```

---

IN POST-DECREMENT: variable assignment before decrement  
by 1.

#### POST-DECREMENT

```
1 y=x--;
```

#### EQUIVALENT LINES OF CODE

```
1 y=x;  
2 x=x-1;
```

```
1 #include <stdio.h>  
2  
3 int main()  
4 {  
5     int x=5;  
6     int y=10;  
7  
8     printf("\nBefore y=x--:  x=%d and y=%d\n",x,y);  
9     y=x--;  
10    printf("\nAfter   y=x--:  x=%d and y=%d\n",x,y);  
11 }
```

- 1 OPERATORS
  - Increment and Decrement
  - Pre-Increment
  - Pre-Decrement
  - Post-Increment
  - Post-Decrement
- 2 COMPOUND STATEMENT
- 3 **LOOPS**
  - While Loop
  - Do-While Loop
  - For Loop
  - Nested Loops
- 4 BREAK & CONTINUE
  - Break
  - Continue
- 5 LABEL & GOTO
- 6 EXERCISES

```
1 while (condition)
2 {
3     [statement_1;
4       statement_2;
5       statement_k;]
6 }
```

- 1 Condition is tested **first** before body of loop is executed.
- 2 Iteration continues as long as the condition remains true.
- 3 At least one of the statements in the body must eventually cause the loop condition to turn false or force a break out from the body.

# Logical flow of control in While Loop

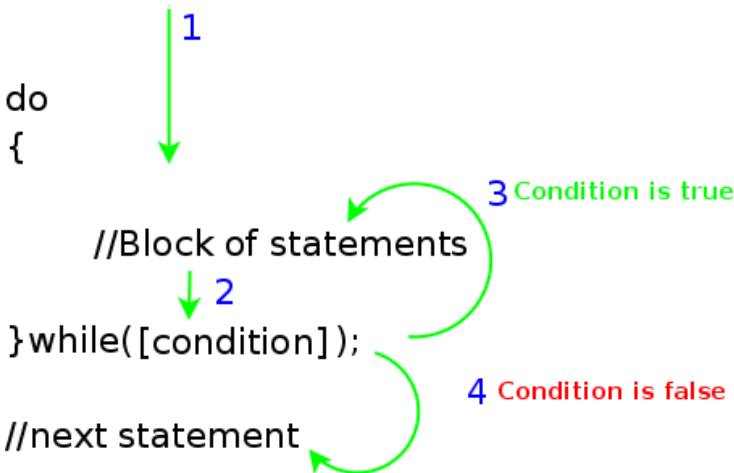

```
1 #include <stdio.h>
2 int main()
3 {
4     int i=0;
5     while(i<10)
6     {
7         i++;
8         printf(" i = %d\n", i);
9     }
10 }
```

```
1 Do
2 {
3     [ statement_1 ;
4       statement_2 ;
5       statement_k ; ]
6 } while ( condition );
```

- 1 Body of code is executed at **least once** before condition is tested.
- 2 Iteration continues as long as the condition remains true.
- 3 At least one of the statements in the body must eventually cause the loop condition to turn false or force a break out from the body.
- 4 The Do-While loop structure must be **terminated!**

```
1 #include <stdio.h>
2 int main()
3 {
4     int i=0;
5     do
6     {
7         i++;
8         printf(" i = %d\n", i);
9     } while (i < 10);
10 }
```

# Logical flow of control in Do-While Loop

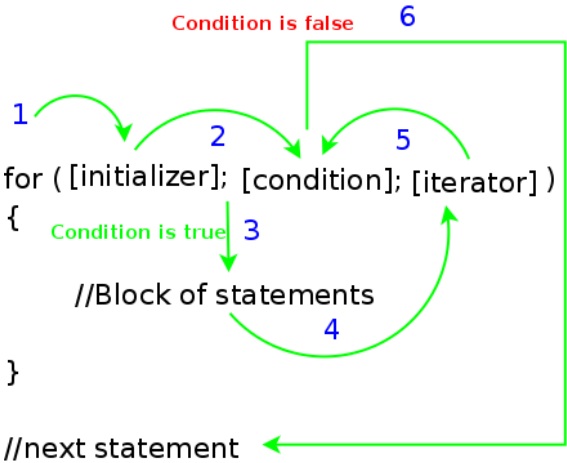

```
1  for ([ initializer ]; [ condition ]; [ iterator ])
2  {
3      [ statement_1 ;
4      statement_2 ;
5      statement_k ; ]
6  }
```

**INITIALIZER** is/are expression(s) evaluated prior to the execution of the loop. It is primarily used to initialize the loop *counter*.

**CONDITION** is the expression that is checked before the commencement of each new iteration. As long as the condition remains true, the body of the for-loops is executed.

**ITERATOR** is an expression that is evaluated after each iteration. The iterator is primarily used to increase / decrease the loop counter.

# Logical flow of control in For Loop

At least one of the statements in the body or the iterator must eventually cause the loop condition to turn false or force a break out from the body

### Example

```
1 #include <stdio.h>
2 int main()
3 {
4     int i;
5     for(i=1; i<11; i++)
6     {
7         printf(" i = %d\n", i);
8     }
9 }
```

## Using For Loop

---

```
1  for ([initializer]; [condition]; [iterator]) //outer loop
2  {
3      for ([initializer]; [condition]; [iterator]) //inner loop
4      {
5          [statement_1;
6          statement_2;
7          statement_k;]
8      }
9  }
```

- 1 Nested loops arise when one loop structure is embedded within the body of another loop structure.
- 2 The embedded loop is referred to as the **inner loop** and the main loop is referred to as the **outer loop**.
- 3 For each iteration of the outer loop, the inner loop must start and complete all of its iterations.

## For Loop

  - Do-While Loop
  - For Loop
  - Nested Loops
- 4 BREAK & CONTINUE
  - Break
  - Continue
- 5 LABEL & GOTO
- 6 EXERCISES

**Break** statement is used within the switch and loop structures to exist the structure.

Upon exit, control is passed to the immediate statement following the structure.

If a **break** statement is placed outside a loop or switch structure, a compile time error is generated.

OPERATORS  
COMPOUND  
STATEMENT  
LOOPS  
BREAK &  
CONTINUE  
BREAK  
CONTINUE  
LABEL &  
GOTO  
EXERCISES

```
1 #include <stdio.h>
2 int main()
3 {
4     int i=10;
5     while(i<26)
6     {
7         if(i%9==0)
8         {
9             printf("1st multiple of 9 btn 10 & 25 is %d", i);
10            break;
11        }
12        i++;
13    }
14    printf("\nDone!\n");
15 }
```

**Continue** statement is used within the loop structures to exit *only* the current iteration.

If a **Continue** statement is placed outside a loop structure, a compile time error is generated.

### Example

```
1 #include <stdio.h>
2 int main()
3 {
4     int i;
5     for (i=1; i < 21; i++)
6     {
7         if ( i % 2 == 0)
8         {
9             continue;
10        }
11        printf("\n %d", i);
12    }
13 }
```

  - Do-While Loop
  - For Loop
  - Nested Loops
- 4 BREAK & CONTINUE
  - Break
  - Continue
- 5 LABEL & GOTO
- 6 EXERCISES

## Statements

---

**label** is used to prefix a statement.

**goto** statements are used to transfer control to a labelled statement.

```

1 #include <stdio.h>
2 int main()
3 {
4     printf("\nPharoh! ");
5
6     goto myline;
7
8     printf("let my people "); //skipped by goto
9
10    myline: printf("go!\n");
11 }
```

Goto statements should be avoided as it leads to the so called spaghetti code making it difficult to follow the logical flow of a program.

- 5 LABEL & GOTO
- 6 EXERCISES

1. Write a C program to generate the product table shown below

	1	2	3	4	5
1	1	2	3	4	5
2	2	4	6	8	10
...	...	...	...	...	...
10	10	20	30	40	50

2. Write a C program that receives an integer as input and outputs the product of its digits. E.g.  $1234 = 24$ ,  $705 = 0$

3. Write a C program that has the following menu options:

- ① Area of a Triangle
- ② Area of a Rectangle
- ③ Area of a Circle
- ④ Exit

The user selects the number corresponding to an option. Upon selecting a menu option, the program takes the appropriate input values from the user and computes the result. After displaying the result, the system returns the user to the menu option.

The program is terminated if menu option 4 is selected.

**Useful formulae:**

$$\text{Area of a Triangle} = \frac{\text{base} * \text{height}}{2}$$

$$\text{Area of a Rectangle} = \text{Length} * \text{Width}$$

$$\text{Area of a Circle} = \pi r^2 \text{ where } \pi = 3.142$$

Special thanks to the following for their initial work:
