# Summary

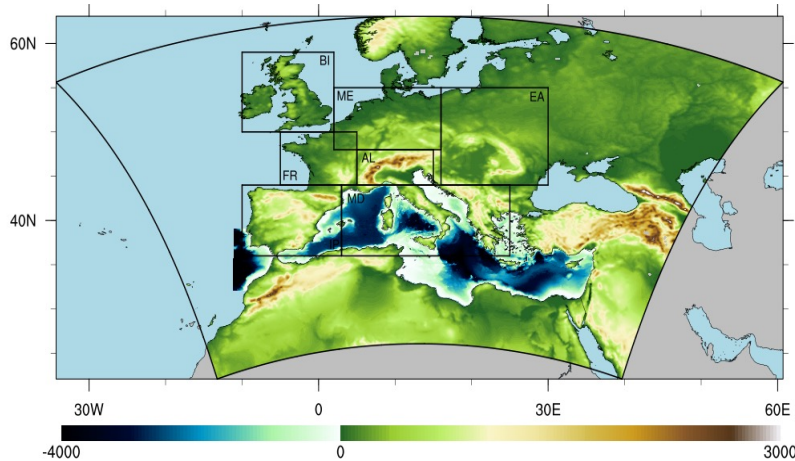

Focus : effects of the high-resolution air-sea coupling for the representation of high impact events, such as marine heat waves and sea-level height

- Model Setup and experimental design
- Present climate representation (in a glance)
- Projected changes in relevant ECVs and and EOVs
- Impact studies, a couple of examples: Sea Level Rise and Marine Heat Waves

Climate Dynamics	
DYNAMICAL DOWNSCALING OF CMIP6 SCENARIOS WITH ENEA-REG: AN IMPACT-ORIENTED APPLICATION FOR THE MED-CORDEX REGION --Manuscript Draft--	
Manuscript Number:	CLDY-D-23-00522
Full Title:	DYNAMICAL DOWNSCALING OF CMIP6 SCENARIOS WITH ENEA-REG: AN IMPACT-ORIENTED APPLICATION FOR THE MED-CORDEX REGION
Article Type:	Original Article
Keywords:	Regional Earth system models; Mediterranean climate; Marine Heatwaves; Sea level height; Med-CORDEX; Future scenario.

# Model setup and experimental design

## ENEA-Reg2.0 : WRF 4.2.2 - MITgcm z67 - HD 1.0.2 / ESMF-NUOPC

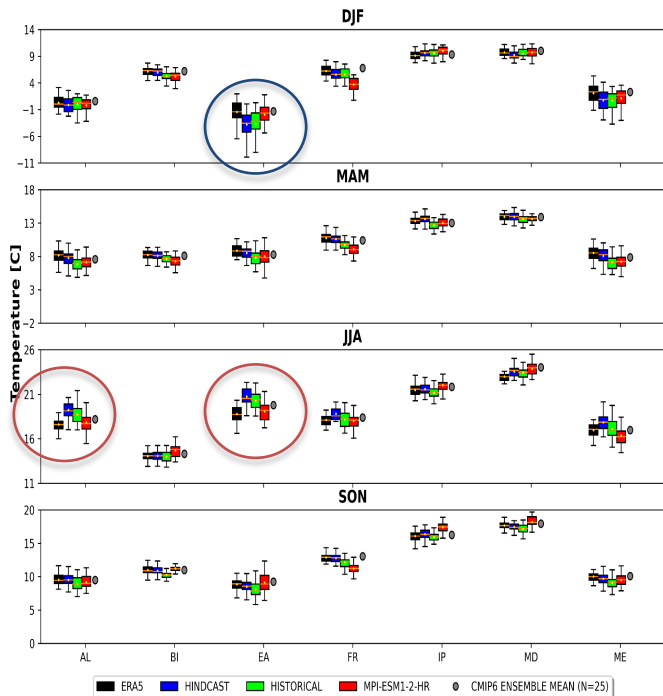

Exp	Driver	LBC	Period	Bias Corr

SSH 2096/2100 – 1995/2014. circulation component

# Climate Change Impact : Sea Level Rise

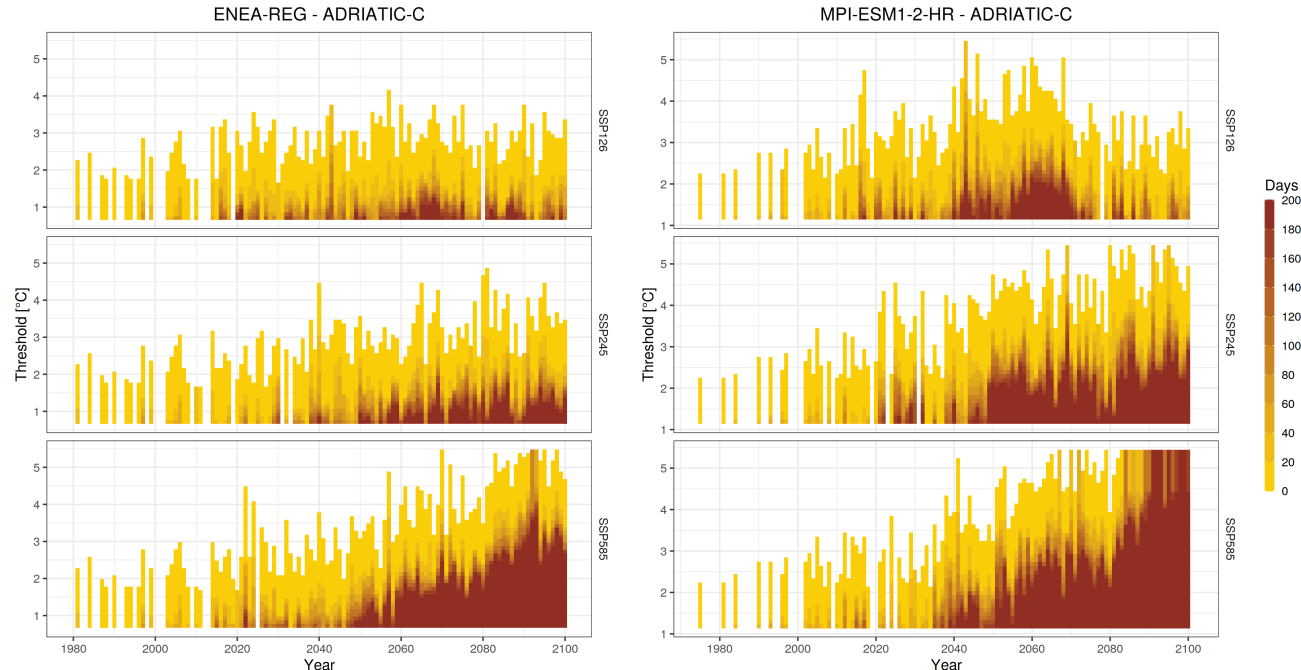

Change of the average total sea level over the Mediterranean basin for the three SSP scenarios (blue curves; dotted=MPI-ESM1-2-HR; dashed=ENEA-REG).

The projections are relative to a 1995-2014 baseline. The thick red line is the median over the AR6 models; the shaded area corresponds to the 17th-83rd percentile range.

# Climate Change Impact : Marine Heat Waves

Definition: periods of at least 5 consecutive days during which the mean temperature over a specific area of interest is above the long-term expected daily value (Hobday et al., 2016).

- Intensity and total annual length for Central Adriatic
- Threshold: between the 95-th percentile and the maximum value of the corresponding daily temperature anomalies w/r to the local seasonal cycle during the historical period (1980-2014)

# Conclusions

- ✓ Improvements in both A-O components with respect to the former version (bias reduction)
- ✓ A positive trend in temperature until mid-century is observed for all scenarios but SSP1-2.6 then reverse the tendency → the inertia of the climate system is expected to anyway shadow the benefits of climate action for a few decades ahead
- ✓ Spatial and temporal variability of Mediterranean dynamic sea level (circulation component) are enhanced in the regional simulations with respect to the global projections, which might have a non-negligible impact on coastal risk assessments.
- ✓ Marine Heat Waves: we highlighted the potential advantage of using a higher resolution ocean component in describing the impact of local dynamics on shorter-time scale fluctuations, especially over enclosed sub-basins such as the Adriatic Sea
- ✓ intensity, frequency, and duration of MHW will increase under SSP2-4.5 and SSP5-8.5, stabilize for SSP1-2.6
- ✓ MHW in SSP5-8.5 imply potential severe impacts on ecosystems, on ecosystem services and on local communities and on the broader Mediterranean economy.

# Present climate representation: variability

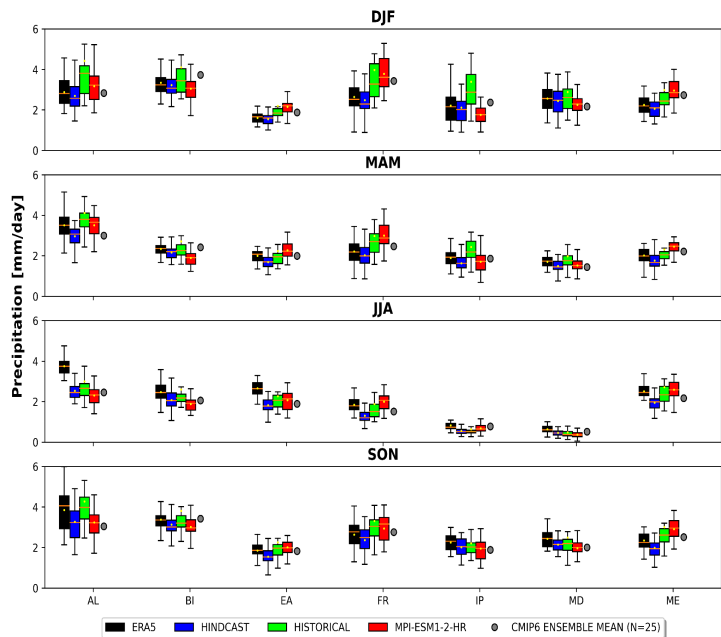

Model Variability Index (MVI)  
of near-surface air temperature

$$\text{MVI} = \left( \frac{\sigma_o}{\sigma_m} - \frac{\sigma_m}{\sigma_o} \right)^2$$

when model variability equals  
that of the observations the MVI  
has a value of 0

# Present climate representation: land precipitation
