TALYS for medical isotope production

Arjan Koning, IAEA

Joint ICTP-IAEA Workshop on Simulation of Nuclear Reaction Data with the TALYS Code, October 16 - 20 2023, Trieste

Introduction

- Medical isotopes from nuclear data point of view
- Global assessment of experimental data and outlier assignment
- Consistent and automated parameter fitting
- Some challenges for medical isotopes and its impurities
- Special case: $\text{Th}232(p,x)\text{Ac}225$
- Conclusions

Currently declared as IAEA medical isotope evaluations

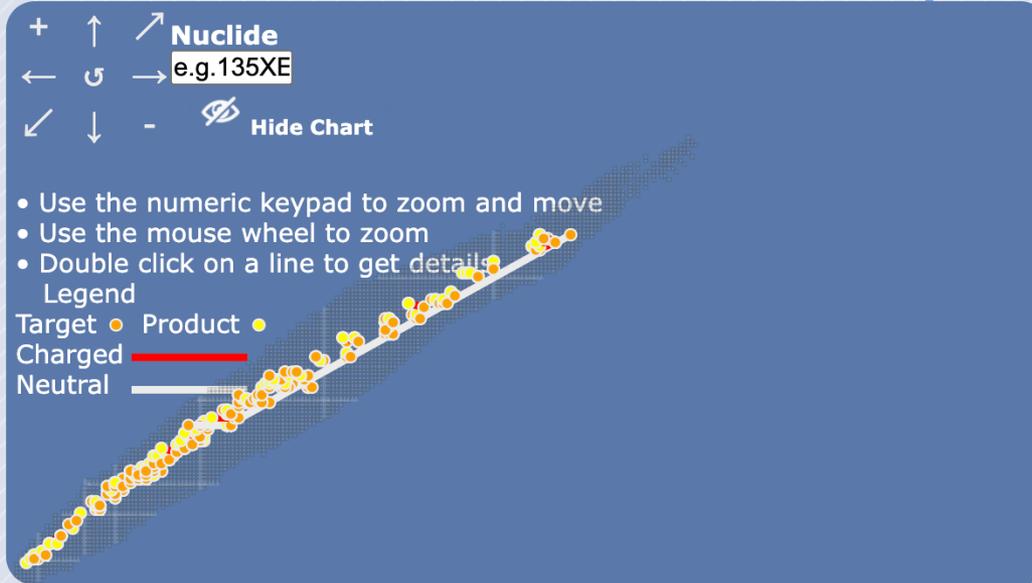

- 21 (p,n) reactions
- 15 (p,2n) reactions
- 7 (p,3n) reactions, etc.
- 4 (d,n) reactions
- 7 (d,2n) reactions
- 5 (d,3n) reactions etc.
- + residual products further away from the target
- Total: about 140 reaction channels

TALYS-Related Software and Databases

TALYS and the TALYS-related packages are open source software and datasets ([GPL License](#)) for the simulation of nuclear reactions.

TALYS

Arjan Koning, Stephane Hilaire, Stephane Goriely

Nuclear reaction model code.

- Download [TALYS-1.96](#)
- Download [previous versions](#)
- Read [Tutorial](#)

Created at    UNIVERSITÉ LIBRE DE BRUXELLES  IAEA International Atomic Energy Agency

EXFORTABLES

Arjan Koning

Experimental nuclear reaction database based on EXFOR.

- Download [EXFORTABLES-1.0](#)
- Read [Tutorial](#)

RESONANCETABLES

Arjan Koning, Dimitri Rochman

Database for thermal cross sections, MACS and average resonance parameters.

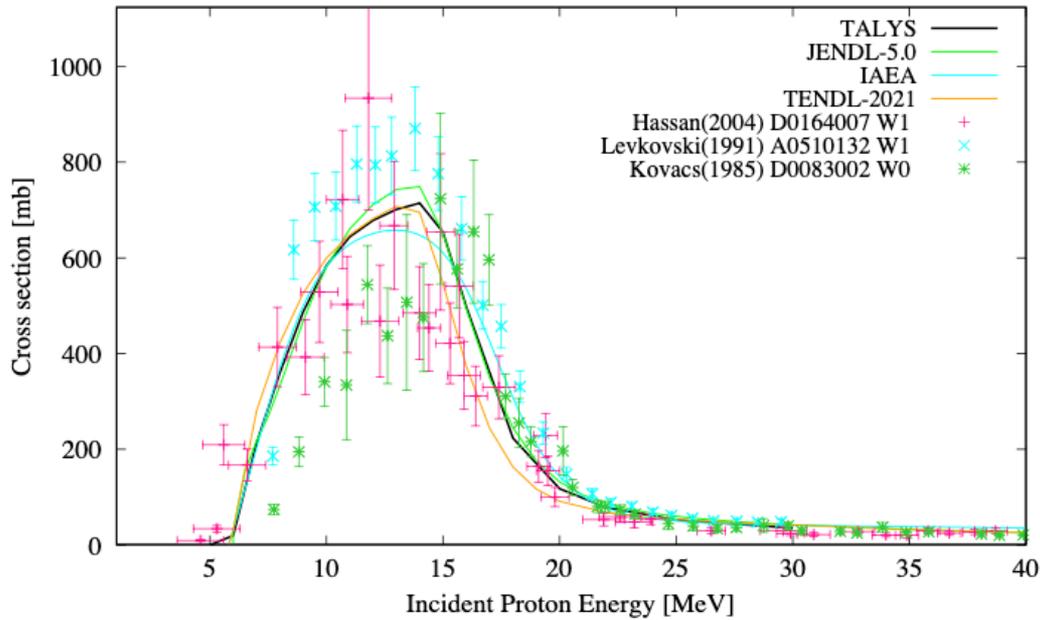

- Download [RESONANCETABLES-1.0](#)
- Read [Tutorial](#)

Created at  IAEA International Atomic Energy Agency  PAUL SCHERRER INSTITUT

Zero-ing in on the truth

- Run TALYS for all projectiles, nuclides and energies with global settings
- Compare with the **entire** EXFOR database
 - Computational access to EXFORtables: directory-structured database with E-dE-xs-dxs data per measurement (from XC5 file, Viktor Zerkin)
 - Automatic normalisation to new monitor and decay data
 - Assign outliers in EXFOR (**Exforcism**)
 - comparison with nuclear data libraries,
 - comparison with TALYS
 - comparison with other experimental data sets
 - quantify historical evaluator's opinion in consistent metadata
- Assess predictive power of TALYS as a function of energy, reaction channel and mass range
- Zoom in on specific reaction channel with automated optimisation, varying a restricted set of TALYS parameters

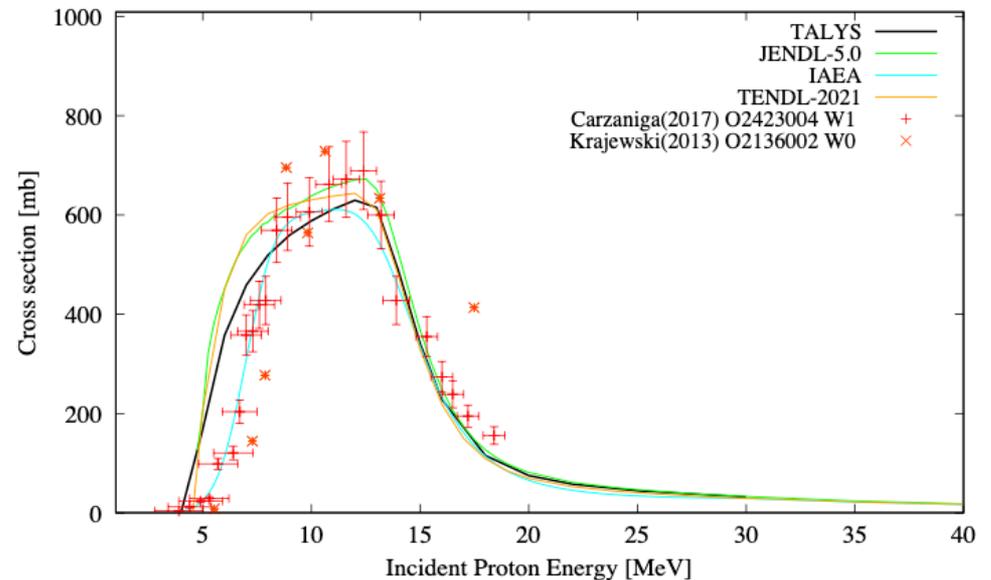

$^{76}\text{Se}(p,n)^{76}\text{Br}$ GOF= 1.22

W0: outlier-by-eye

Challenge: EXFOR data may be hidden under different reaction identifiers. Completeness of experimental data from EXFOR to EXFORtables not ensured, some data sets may be missing.

$^{44}\text{Ca}(p,n)^{44}\text{Sc}$ GOF= 1.18

Weighting data sets in EXFOR

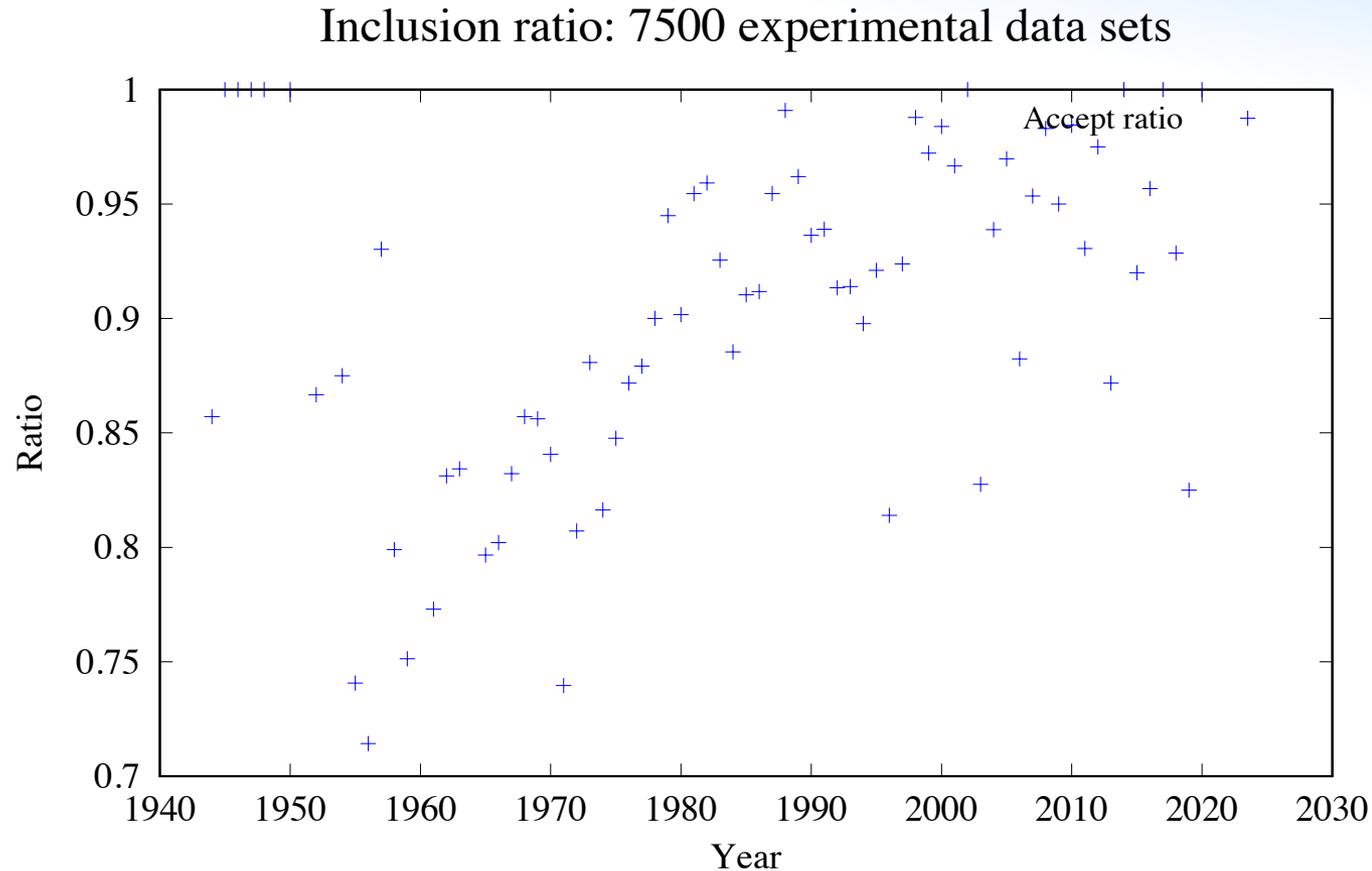

- Weights for ~28000 EXFOR subentries
 - Natalia Dzysiuk for activation c.s. + (all c.s.) Ni: 2336 subentries
 - Erwin Alhassan for proton induced reactions: 166 subentries
 - Natalie Gaughan for proton induced reactions: 103 subentries
 - Arjan Koning for neutron activation cross sections: NEA/DB/DOC(2017)1: 25850 subentries, based on automated χ^2
 - Arjan Koning (2022) for neutron up to alpha-induced cross sections - visual outlier assignment: 8000 subentries
 - Available in JSON files, including all comments etc.

8400 JSON outlier/inlier files, one per EXFOR subentry

EXFOR outlier assignment

Summed over all (n,g) , (n,f) , (n,n') , $(n,2n)$, (n,p) , (n,a) , (p,n) , (g,n) , (a,n) , (d,n) reactions we could mine from EXFOR. 6500 accepts, 1000 rejects

EXFOR outlier assignment: a learning curve?

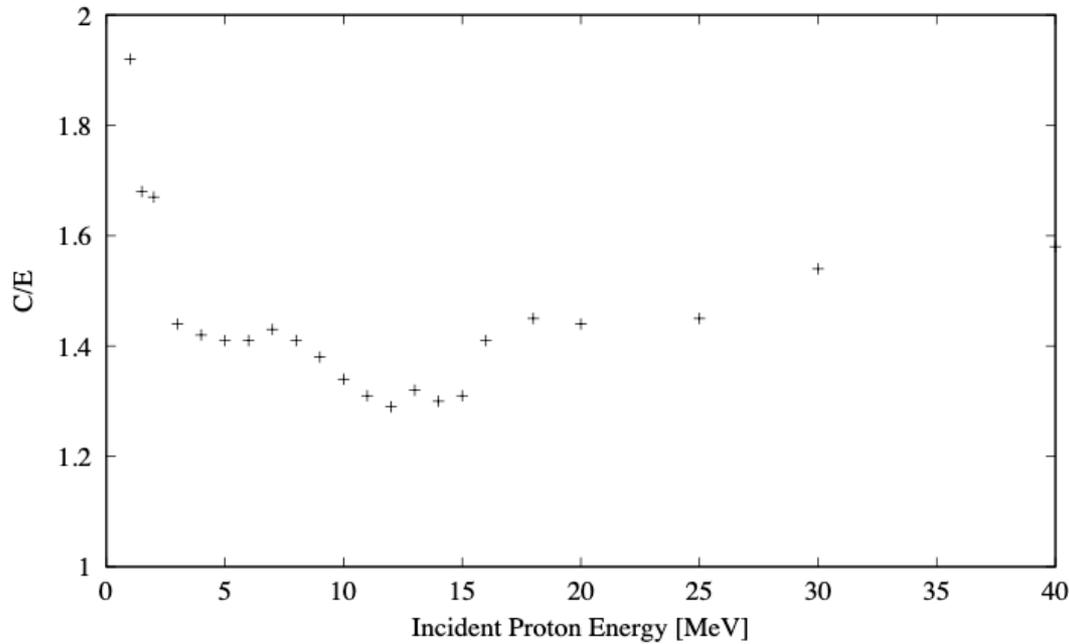

Inclusion ratio: 7500 experimental data sets (7 year average)

Other analyses possible:

- per reaction channel
- per author, co-author, lab, etc (probably should not publish THAT)
- per incident energy (e.g. 14 MeV)
- re-insert this as prior in the next Bayesian update

TENDL-2021 (Global TALYS) versus 687 (p,n) exp. data sets

Global predictive power for
(p,n): ~30% around the peak

(p,2n): ~40%

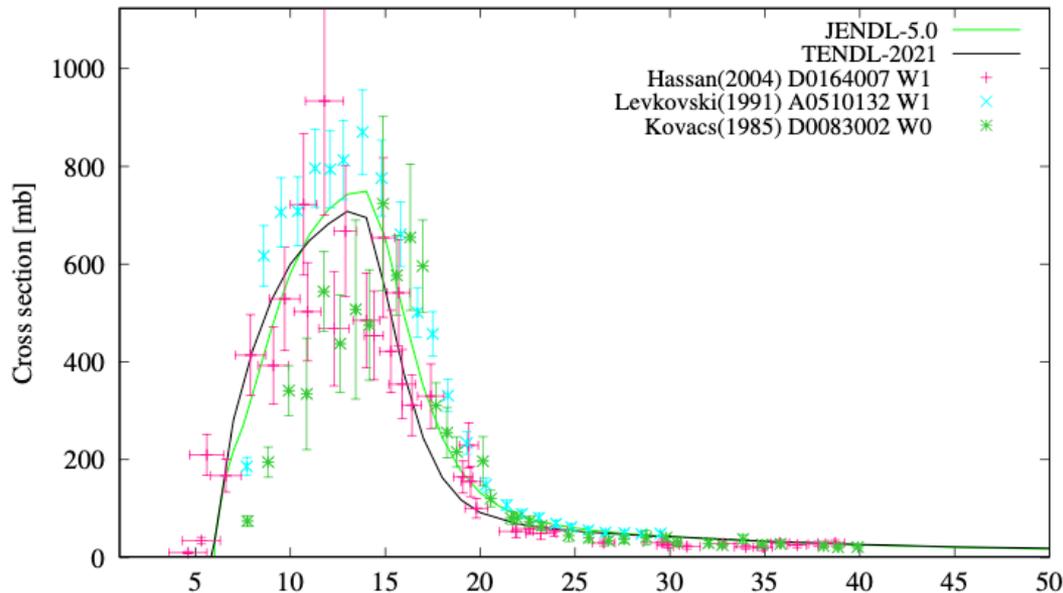

(alpha,n): ~45%

(d,n): ~60%

Common trend for all threshold reactions. Relative deviation is

- Large near threshold (> 2)
- Small near peak
- Larger in the tail

Global predictive power is energy dependent

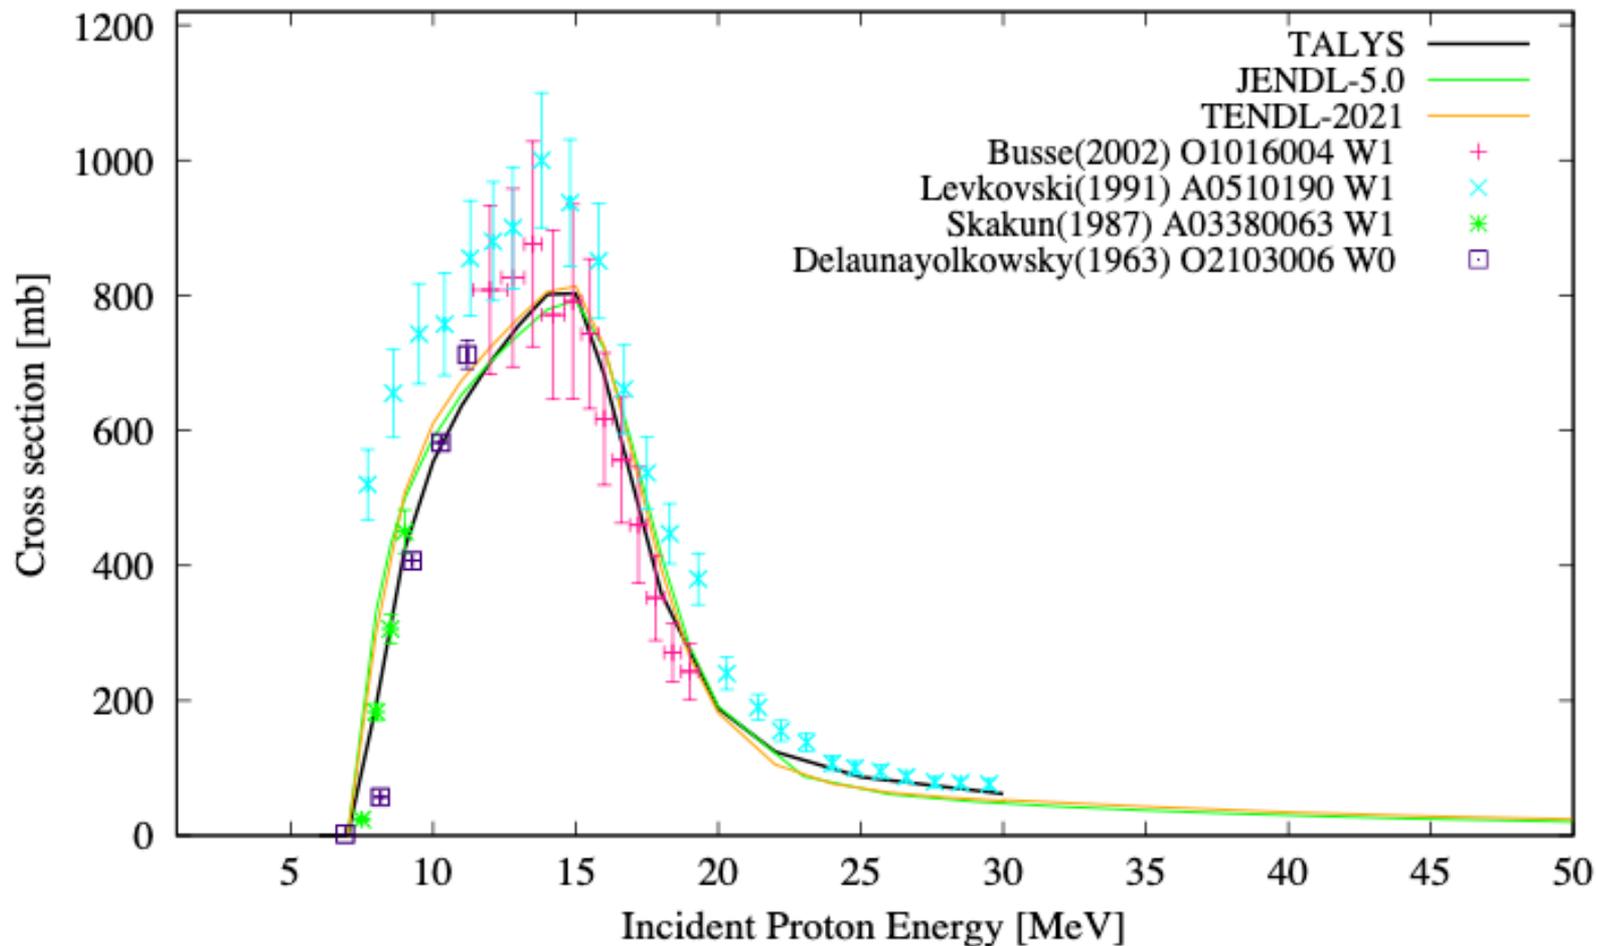

Systematic approach for TALYS

- 1. Compare every (e.g.) (p,n) for which exp. data exists (140 nuclides) with the available nuclear data libraries.
 - Always TENDL, but also JENDL-5 , ENDF/B-VIII and IAEA evaluation
 - Flag outliers, or discarded data sets, in EXFOR with a weight of 0
- 2. Write a script which uses TASMAN: statistical code for TALYS for covariance generation and automatic optimisation of nuclear model parameters to exp data
 - Loop over all 140 nuclides
 - Use the same 5 most sensitive parameters for (p,n) reactions
 - Use Nelder-Mead optimisation to all EXFOR data sets and pseudo data, this requires about 80 TALYS runs
 - Plot the results
 - If needed declare more, or less, outliers
- 3. Do this for every reaction channel

(p,n): several nuclides with JENDL-5 evaluation

$^{90}\text{Zr}(p,n)^{90}\text{Nb}$ GOF= 1.156

TALYS parameters for optimization

Reaction	Nuclides in EXFOR	Parameter	Parameter	Parameter	Parameter	Parameter	Parameter
(n, γ)	278	wtable					
(n,f)	34	vfiscor	betafiscor	ctable(1)	ptable(1)	ctable(2)	ptable(2)
(n,n'), (n,2n), (n,p)	210	rv(p)	$g_{ph}(0)$	$g_{ph}(n)$	ctable(n)	ctable(p)	
(N, α)	157	rv(α)	Cstrip(α)	$g_{ph}(0)$	ctable(α)		
(p,n)	142	rv(p)	rwd(p)	rv(n)	$g_{ph}(0)$	$g_{ph}(n)$	ctable(n)
(γ ,n)	77	wtable	ftable	etable			
(α ,n)	93	rv(α)	rwd(α)	rv(n)	$g_{ph}(0)$	ctable(α)	
(d,n)	40	rv(p)	rwd(p)	rv(n)	$g_{ph}(0)$	$g_{ph}(n)$	ctable(n)

TASMAN code (AK): Nelder-Mead optimisation.

Number of TALYS trials: $N(\text{parameters}) \times 20$

Essential 1: Optical model potential (OMP) for proton reaction cross sections

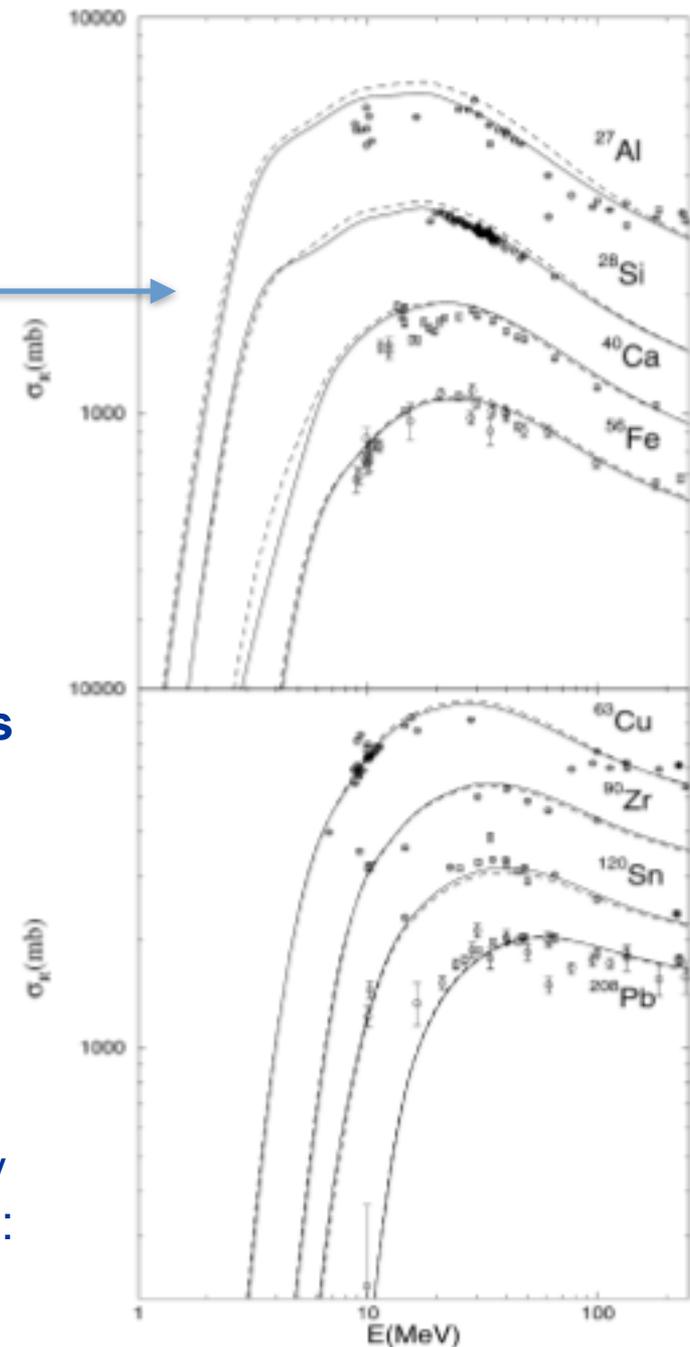

Predictive power for KD03 global proton
OMP up to 200 MeV $\sim 8\%$

Essential 2: Nuclear level densities

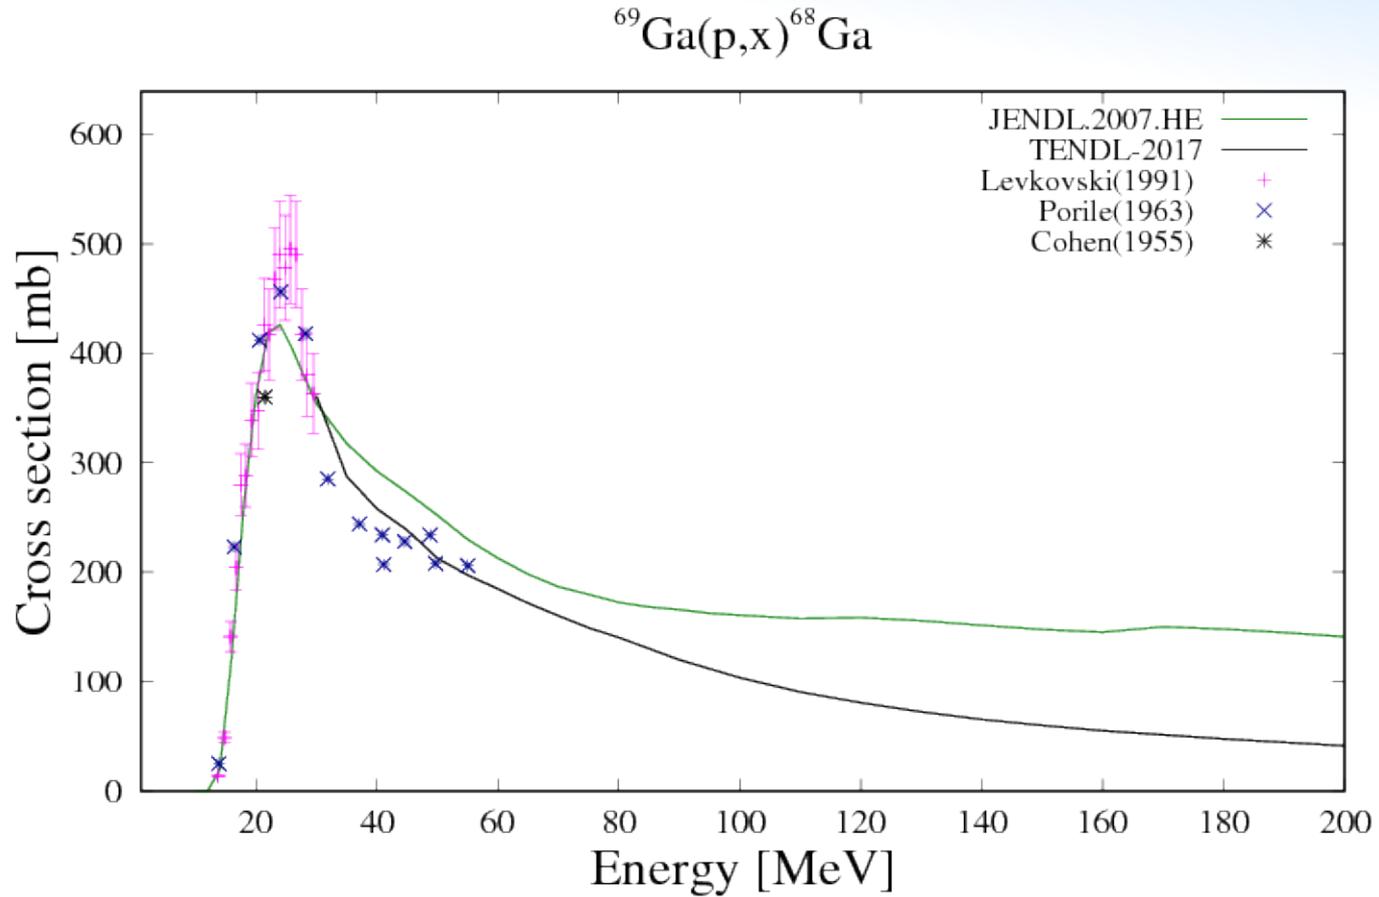

Different level density models may give
differences of 10-15% in peak values of
excitation functions

Essential 3: Pre-equilibrium nuclear models (and multiple pre-equilibrium models above 30-40 MeV)

TALYS exciton model parameterisation has
been established from single- and double-diff
emission spectra, not from production cross
sections
(See M.B. Fox et al, Investigating High-Energy
Proton-Induced Reactions on Spherical Nuclei:
Implications for the Pre-Equilibrium Exciton
Model, Phys Rev C, tbp 2021)

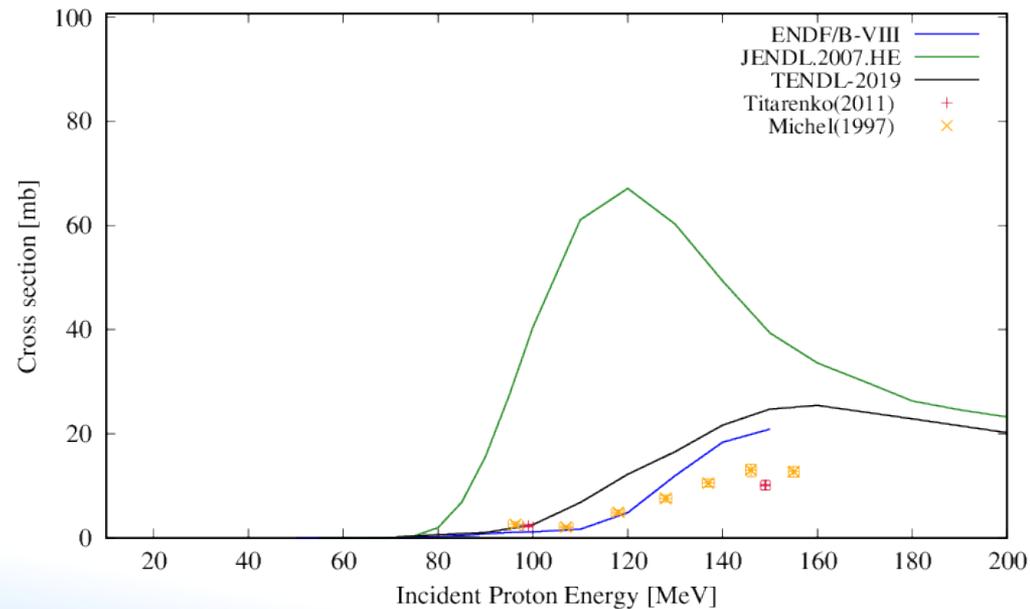

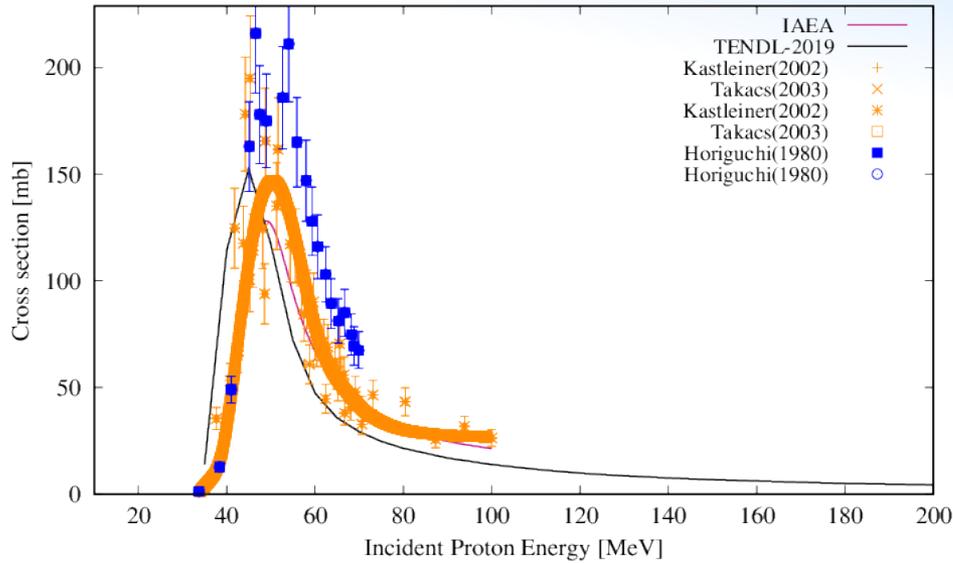

Typical example #1: direct good fit!

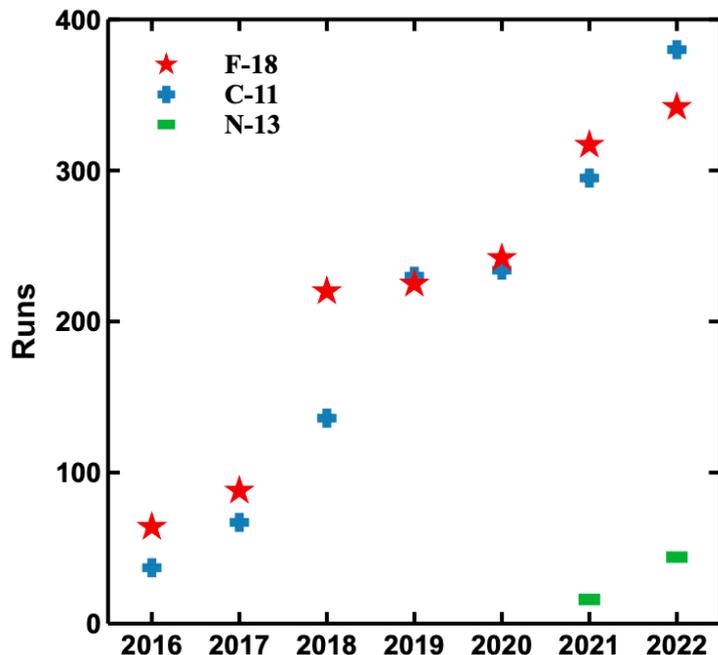

Plots for all particles, all nuclides, all reactions:
nds.iaea.org/talys

Typical example #2: further TALYS adjustment needed

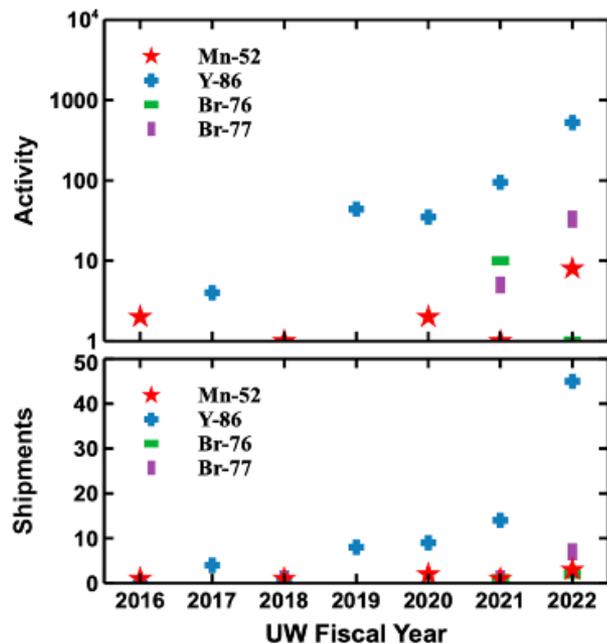

Reaction-specific adjustments
for level density and pre-equilibrium
parameters required

Radionuclide Demand

Internal runs of ^{18}F , ^{11}C , and ^{13}N by radionuclide as an aggregated annual total vs UW fiscal year. A “Run” is defined as a single production, or uninterrupted period of irradiation, whose product is delivered to a single user.

Breakdown of individual radionuclides ^{52}gMn , ^{86}Y , and $^{76/77}\text{Br}$. The top plot shows activity produced in millicuries and the bottom shows individual shipments made against UW fiscal years from 2016 – 2022.

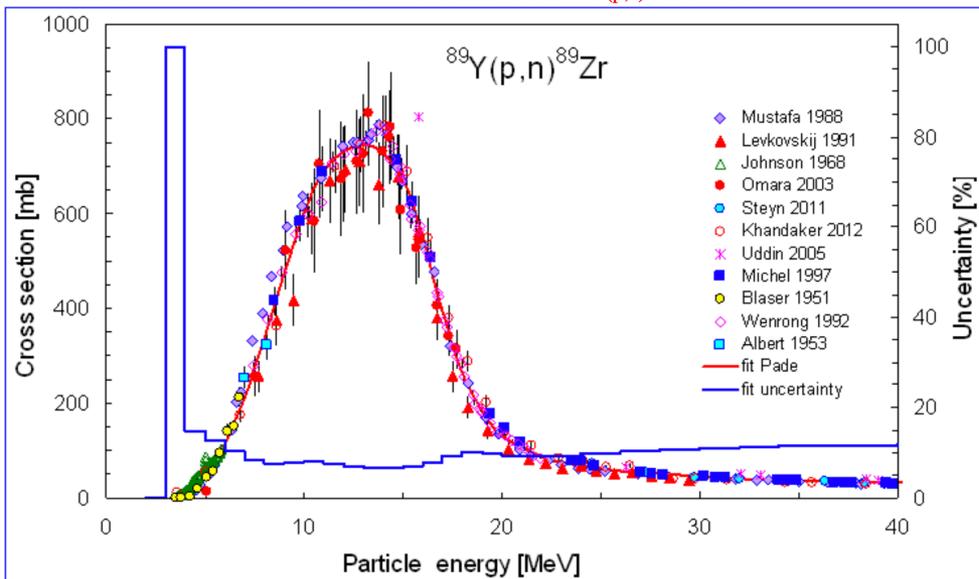

Nuclear Data Needs for Medical Radionuclide Producers

Need 1/2: Evaluations of Near-Threshold XS Data and of Produced Impurities

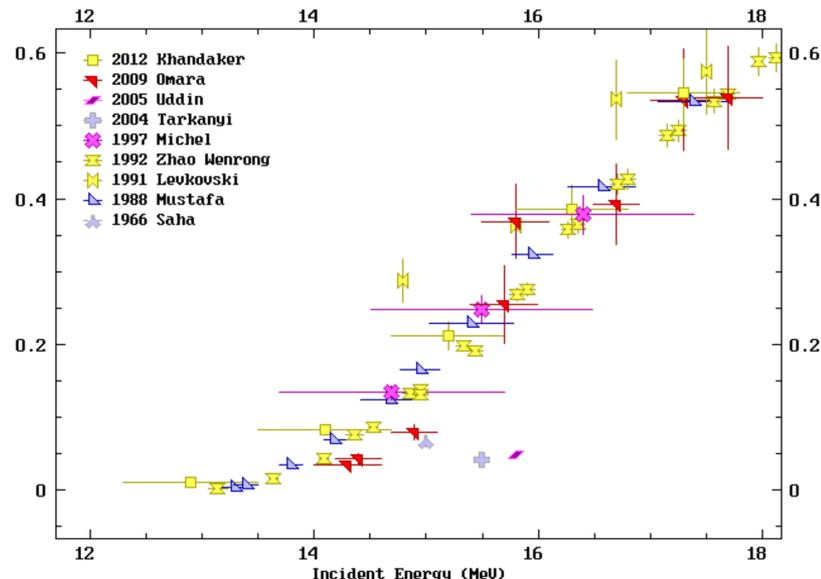

Many available accelerators operate at energies close to thresholds of relevant production reactions, e.g., (p, α), (p,pn), (d,n), (p,2n), (d,2n), (d, α).

Recommended cross sections with estimated uncertainties for the $^{89}\text{Y}(p,n)^{89}\text{Zr}$ reaction

Updated: Aug. 2018.

mass 232  
energy 10. 200. 5.  
partable y  
bins 100  
Cbarrier 0.92
```

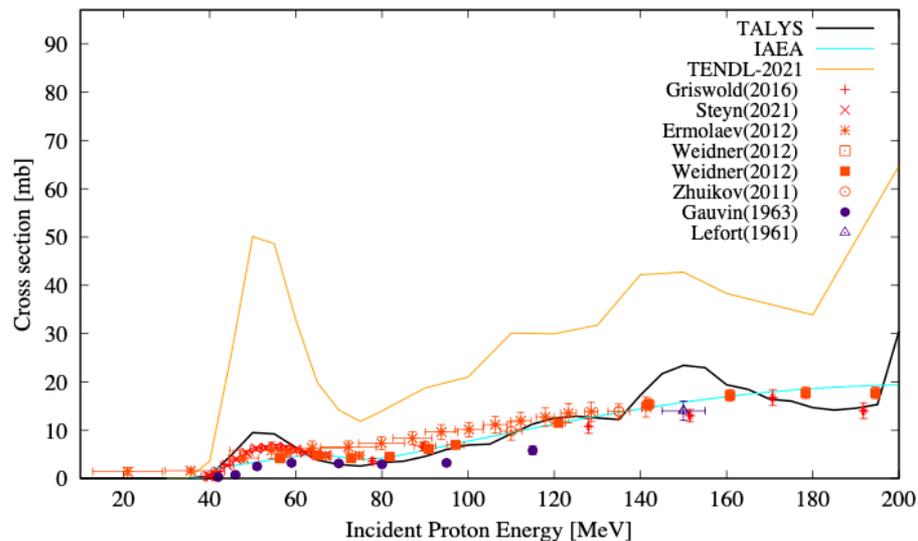

TALYS-2: one parameter 'Cbarrier' to reduce/increase all fission barriers

Th232(p,f) could be higher compared to TENDL-2021

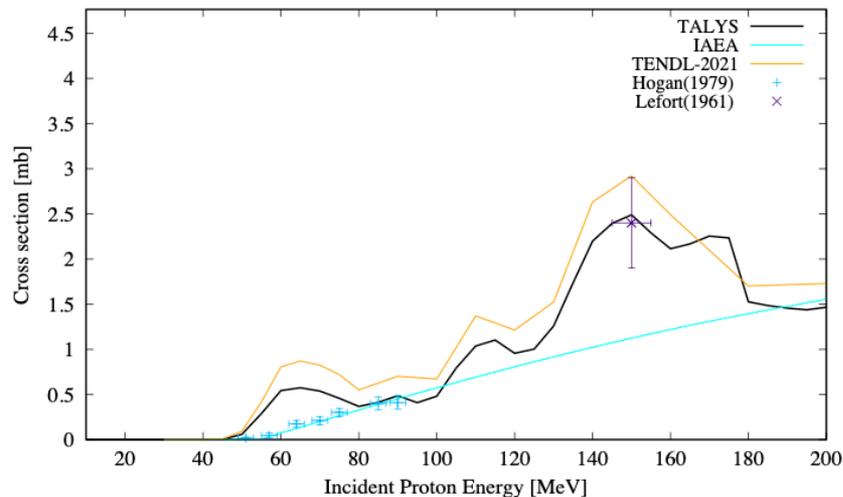

Consistency with neighbouring channels

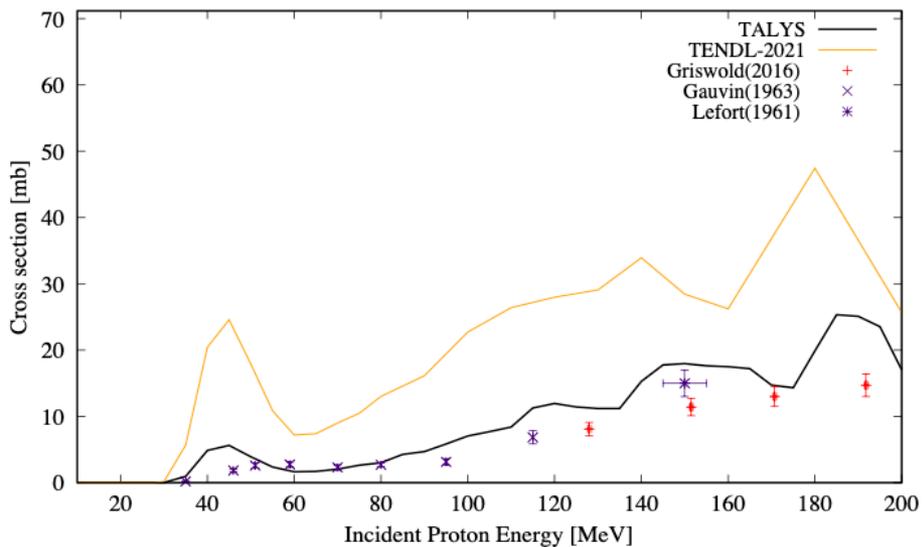

$^{232}\text{Th}(p,x)^{225}\text{Ac}$

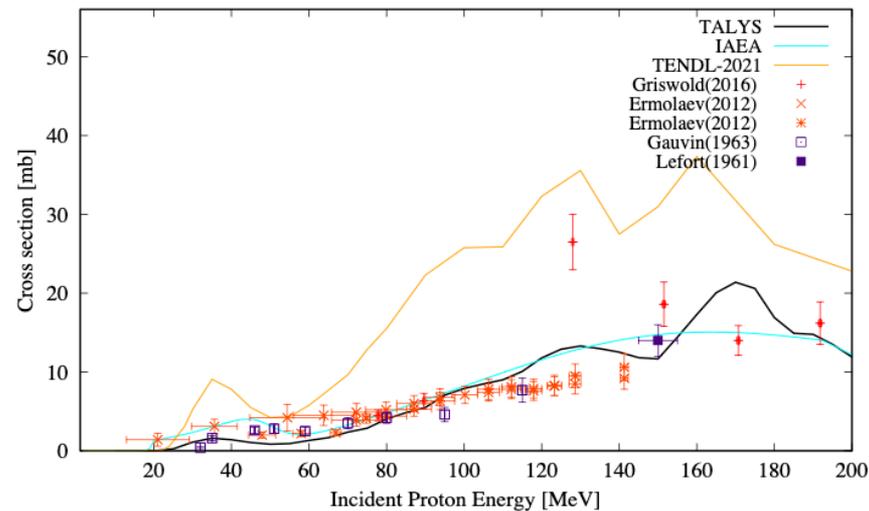

$^{232}\text{Th}(p,x)^{225}\text{Ra}$

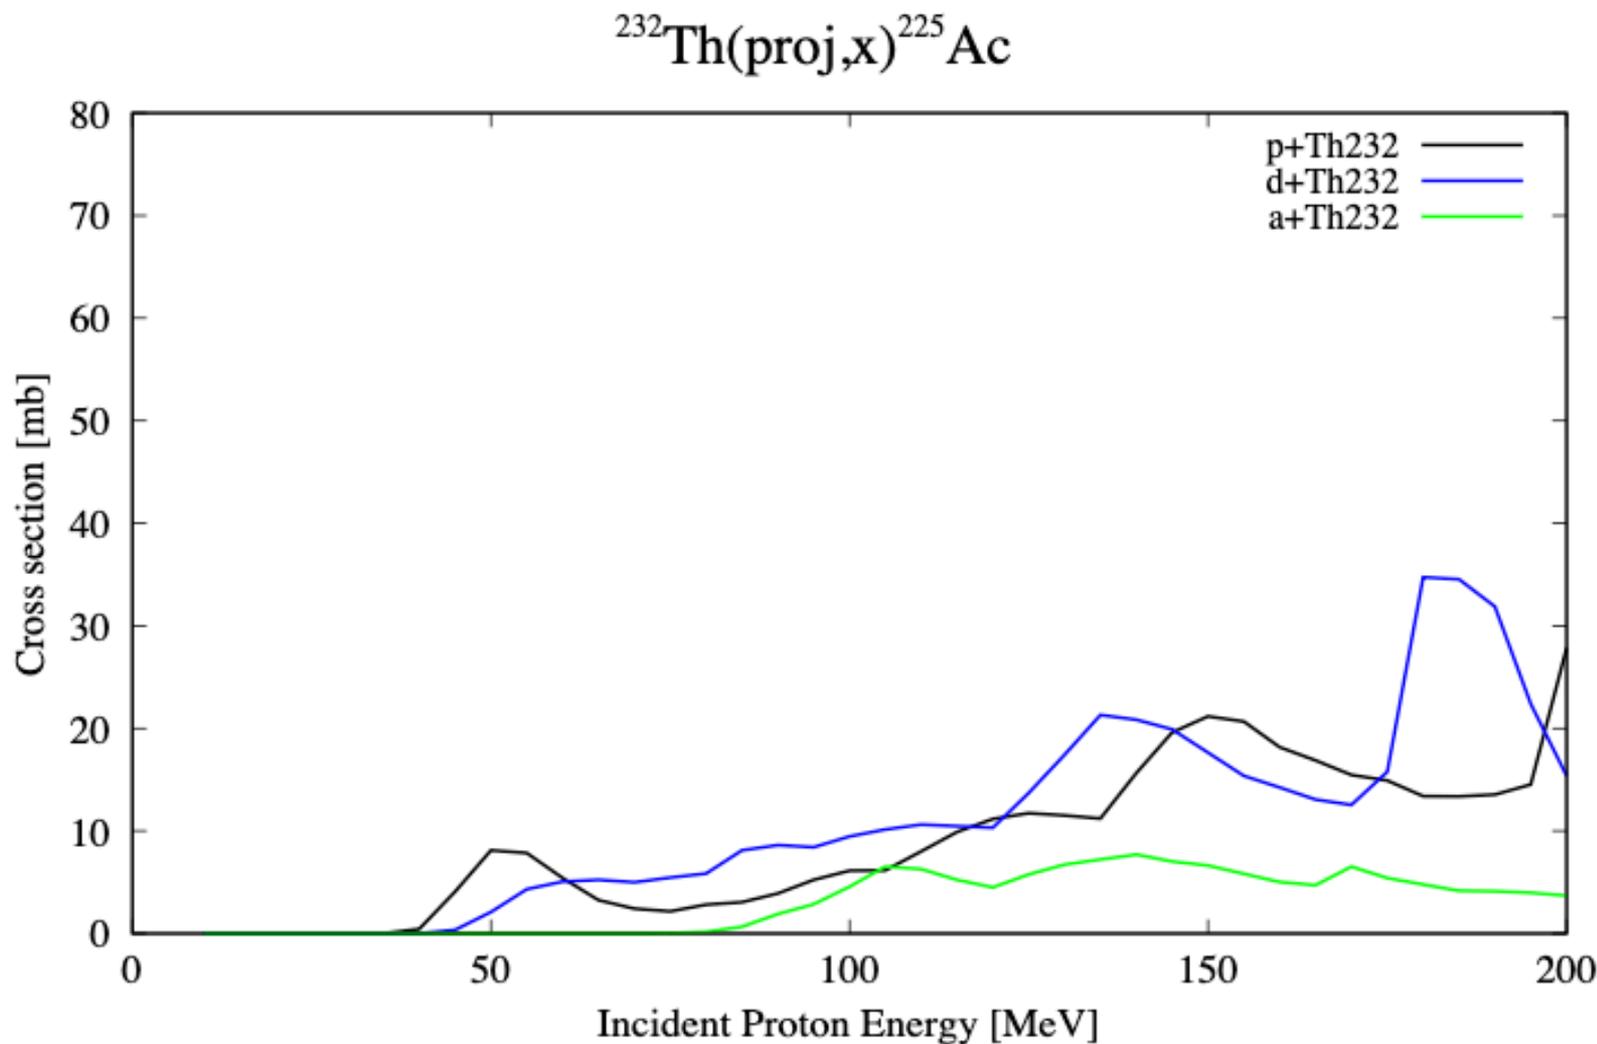

$^{232}\text{Th}(p,x)^{226}\text{Ac}$

$^{232}\text{Th}(p,x)^{227}\text{Ac}$

Other projectiles?

Conclusions

- Automated optimisation to many reaction channels with a relatively small number of TALYS parameters
 - Requires computational access to entire EXFOR database at once
 - Requires extensive outlier database
- TENDL-2023 will contain optimised excitation functions

IAEA
