

Using (tiny) Machine Learning for Agriculture in Remote Areas of Indonesia

Agus Subekti

National Research and Innovation Agency, Indonesia, and
Nusa Mandiri University, Jakarta, Indonesia
`agus.subekti@brin.go.id`

UNU Macau, 30 April 2024

Uncovered of Internet Connection

- many rural areas are not connected to the Internet
- cloud based machine learning inference is not suitable

Use Case 1: Selecting fruits that's ready to be picked

(a)

(b)

(c)

Machine Learning for selecting fruit

Use case 2: plant disease detection

Eucalliptus pellita's leaf disease detection

- Eucalliptus pellita is used for making pulp/paper
- It is planted in remote areas, no experts in agricultural diseases

Seeding

some bacterial diseases

Normal

Xanthomonas

Cylindrocladium

Machine Learning for diseases classification

Future Planning

- improve to object detection
- low cost tinyML solutions
- dissemination of knowledge on how to make
- crowd sensing

1

¹The experiments of presented work're performed by my supervised students: Yusuf(2023) and Deviana(2023)

Thank you for all Organizers and Participants
ICTP-UNU Workshop on TinyML for Sustainable Development 2024
