#### Gromov–Witten invariants

X is a smooth projective complex 3-fold, and

$$\overline{M}_{g,n}(X,\beta) = \{f: (C,p_1,\ldots,p_n) \to X\}/\sim$$

is the space of stable maps from nodal curves of genus g with n markings in the class  $\beta \in H^2(X, \mathbb{Z})$ .

For classes  $\gamma_i \in H^*(X)$ , we can define **Gromov–Witten** invariants:

$$\langle \gamma_1 \cdots \gamma_n \rangle_{g,\beta}^{GW} := \int_{\overline{M}_{g,n}(X,\beta)} \prod_i \operatorname{ev}_i^*(\gamma_i), \quad \operatorname{ev}_i \colon \overline{M}_{g,n}(X,\beta) \to X.$$

**Algebraic geometers** want to interpret  $\langle \gamma_1 \cdots \gamma_n \rangle_{g,\beta}^{GW}$  as **counts** of curves of genus g in a class  $\beta$  passing through  $\gamma_i$ .

▲□▶ ▲□▶ ▲目▶ ▲目▶ 目 りへぐ

There are **problems** with this interpretation.

(ロ)、(型)、(E)、(E)、(E)、(O)へ(C)

• Contracted components:

• Multiple covers:

There are **problems** with this interpretation.

• Contracted components:

• Multiple covers:

This leads to **overcounts** in GW invariants, i.e. lower-genus counts contribute to higher-genus ones. Moreover, they are **rational** numbers.

▲□▶ ▲□▶ ▲目▶ ▲目▶ 目 りへぐ

For a Calabi-Yau 3-fold, Gopakumar-Vafa'98:

For a Calabi-Yau 3-fold, Gopakumar-Vafa'98:

$$\sum_{g,\beta} \langle \emptyset \rangle_{g,\beta}^{GW} q^{\beta} \lambda^{2g-2} = \sum_{g,\beta} \langle \emptyset \rangle_{g,\beta}^{GV} \lambda^{2g-2} \left( \sum_{d \ge 1} \frac{1}{d} \left( \frac{\sin(d\lambda/2)}{\lambda/2} \right)^{2g-2} q^{d\beta} \right)$$

٠

For a Calabi-Yau 3-fold, Gopakumar-Vafa'98:

$$\sum_{g,\beta} \langle \emptyset \rangle_{g,\beta}^{GW} q^{\beta} \lambda^{2g-2} = \sum_{g,\beta} \langle \emptyset \rangle_{g,\beta}^{GV} \lambda^{2g-2} \left( \sum_{d \ge 1} \frac{1}{d} \left( \frac{\sin(d\lambda/2)}{\lambda/2} \right)^{2g-2} q^{d\beta} \right)$$

.

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

This can be taken as an **indirect** definition of **Gopakumar–Vafa** invariants  $\langle \emptyset \rangle_{g,\beta}^{GV}$ , also known as **BPS** invariants.

For a Calabi-Yau 3-fold, Gopakumar-Vafa'98:

$$\sum_{g,\beta} \langle \emptyset \rangle_{g,\beta}^{GW} q^{\beta} \lambda^{2g-2} = \sum_{g,\beta} \langle \emptyset \rangle_{g,\beta}^{GV} \lambda^{2g-2} \left( \sum_{d \ge 1} \frac{1}{d} \left( \frac{\sin(d\lambda/2)}{\lambda/2} \right)^{2g-2} q^{d\beta} \right)$$

For a Fano 3-fold, e.g.  $\mathbb{P}^3$ , **Pandharipande**'03:

$$\sum_{g} \langle \gamma_1 \cdots \gamma_n \rangle_{g,\beta}^{GW} \lambda^{2g-2} = \sum_{g} \langle \gamma_1 \cdots \gamma_n \rangle_{g,\beta}^{GV} \lambda^{2g-2} \left( \frac{\sin(\lambda/2)}{\lambda/2} \right)^{2g-2+c_1(X)\cdot\beta}$$

٠

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三 のへぐ

For a Calabi–Yau 3-fold, Gopakumar–Vafa'98:

$$\sum_{g,\beta} \langle \emptyset \rangle_{g,\beta}^{GW} q^{\beta} \lambda^{2g-2} = \sum_{g,\beta} \langle \emptyset \rangle_{g,\beta}^{GV} \lambda^{2g-2} \left( \sum_{d \ge 1} \frac{1}{d} \left( \frac{\sin(d\lambda/2)}{\lambda/2} \right)^{2g-2} q^{d\beta} \right)$$

This can be taken as an **indirect** definition of **Gopakumar–Vafa** invariants  $\langle \emptyset \rangle_{g,\beta}^{GV}$ , also known as **BPS** invariants.

For a Fano 3-fold, e.g.  $\mathbb{P}^3$ , **Pandharipande**'03:

$$\sum_{g} \langle \gamma_1 \cdots \gamma_n \rangle_{g,\beta}^{GW} \lambda^{2g-2} = \sum_{g} \langle \gamma_1 \cdots \gamma_n \rangle_{g,\beta}^{GV} \lambda^{2g-2} \left( \frac{\sin(\lambda/2)}{\lambda/2} \right)^{2g-2+c_1(X)\cdot\beta}$$

In this case, there are no **multiple covers**. When  $\beta \neq d\beta'$  and  $c_1(X) \cdot \beta = 0$ , these formulas coincide.

◆□▶◆□▶◆≧▶◆≧▶ ≧ りへぐ

The terms  $\left(\frac{\sin(\lambda/2)}{\lambda/2}\right)^{2g-2}$  are responsible for contracted components; they are Hodge integrals on  $\overline{M}_{g,m}$ .

The terms  $\left(\frac{\sin(\lambda/2)}{\lambda/2}\right)^{2g-2}$  are responsible for contracted components; they are Hodge integrals on  $\overline{M}_{g,m}$ .

Summation of  $\frac{1}{d} \left(\frac{\sin(d\lambda/2)}{\lambda/2}\right)^{2g-2} q^{d\beta}$  over d is responsible for multiple covers; this is a plethystic exponential,  $S^{\bullet}BPS = DT$  (or GW).

The terms  $\left(\frac{\sin(\lambda/2)}{\lambda/2}\right)^{2g-2}$  are responsible for contracted components; they are Hodge integrals on  $\overline{M}_{g,m}$ .

Summation of  $\frac{1}{d} \left(\frac{\sin(d\lambda/2)}{\lambda/2}\right)^{2g-2} q^{d\beta}$  over d is responsible for multiple covers; this is a plethystic exponential,  $S^{\bullet}BPS = DT$  (or GW).

By the works of Zinger, Ionel, Parker, Doan and Walpuski (the most recent is from 2021), we know that GV invariants satisfy **integrality**,

$$\langle \dots \rangle_{g,\beta}^{GV} \in \mathbb{Z},$$

and finiteness,

$$\langle \dots \rangle_{g,\beta}^{GV} = 0$$
, for  $g \gg 0$ .

The terms  $\left(\frac{\sin(\lambda/2)}{\lambda/2}\right)^{2g-2}$  are responsible for contracted components; they are Hodge integrals on  $\overline{M}_{g,m}$ .

Summation of  $\frac{1}{d} \left(\frac{\sin(d\lambda/2)}{\lambda/2}\right)^{2g-2} q^{d\beta}$  over d is responsible for multiple covers; this is a plethystic exponential,  $S^{\bullet}BPS = DT$  (or GW).

By the works of Zinger, Ionel, Parker, Doan and Walpuski (the most recent is from 2021), we know that GV invariants satisfy **integrality**,

 $\langle \dots \rangle_{g,\beta}^{GV} \in \mathbb{Z},$ 

and finiteness,

$$\langle \dots 
angle_{g,\beta}^{GV} = 0, \, \, {
m for} \, \, g \gg 0.$$

All together this solves all (geometric) problems of GW theory. However, a **direct** construction of GV invariants is very much desired.

Building on the works of Hosono–Saito–Takahashi, Katz and Kiem–Li, **Maulik–Toda**'16 proposed to define GV invariants via

Building on the works of Hosono–Saito–Takahashi, Katz and Kiem–Li, **Maulik–Toda**'16 proposed to define GV invariants via

 $\mathcal{M}(X) = \{1\text{-dim. sheaves } F \text{ on } X\} \to \operatorname{Chow}(X), \quad F \mapsto \operatorname{supp}(F).$ 

Building on the works of Hosono–Saito–Takahashi, Katz and Kiem–Li, **Maulik–Toda**'16 proposed to define GV invariants via

▲ロ ▶ ▲周 ▶ ▲ 国 ▶ ▲ 国 ▶ ● の Q @

Building on the works of Hosono–Saito–Takahashi, Katz and Kiem–Li, Maulik–Toda'16 proposed to define GV invariants via

 $\mathfrak{M}(X) = \{1\text{-dim. sheaves } F \text{ on } X\} \to \mathrm{Chow}(X), \quad F \mapsto \mathrm{supp}(F).$ 

The definition works for Calabi–Yau 3-folds. In agreement with Gopakumar–Vafa's approach.

Building on the works of Hosono–Saito–Takahashi, Katz and Kiem–Li, Maulik–Toda'16 proposed to define GV invariants via

 $\mathfrak{M}(X) = \{1\text{-dim. sheaves } F \text{ on } X\} \to \mathrm{Chow}(X), \quad F \mapsto \mathrm{supp}(F).$ 

The definition works for Calabi–Yau 3-folds. In agreement with Gopakumar–Vafa's approach.

However, it is not clear how to prove that Maulik–Toda invariants are equal to GV invariants in general. Can be verified in some instances by explicitly computing the invariants. Very difficult to compute.

Kim–Kresch–Oh'11 constructed another candidate - unramified Gromov–Witten theory.
# A direct mathematical definition?

Kim–Kresch–Oh'11 constructed another candidate - unramified Gromov–Witten theory.

The basic idea is simple: consider only **unramified maps** from curves (i.e.  $df \neq 0$  at all points),

A **Fulton–MacPherson degeneration** of *X*, denoted by *W*, is *X* with trees of  $\mathbb{P}^{dim}$  attached to it:

Like in Gromov–Witten theory, we can define spaces of unramified maps to FM degenerations of X,

$$u\overline{M}_{g,n}(X,\beta) = \{f \colon (C,p_1,\ldots,p_n) \to W \mid f \text{ is unramified}\}/\sim .$$

Spaces  $u\overline{M}_{g,n}(X,\beta)$  are very similar to  $\overline{M}_{g,n}(X,\beta)$ . If dim(X) = 1, these are spaces of covers of a curve, known as **Hurwitz** spaces.

<ロト < 団ト < 団ト < 団ト < 団ト 三 のへで</p>

We define unramified Gromov-Witten invariants:

$$\langle \gamma_1 \cdots \gamma_n \rangle_{g,\beta}^{uGW} := \int_{u\overline{M}_{g,n}(X,\beta)} \prod_i \operatorname{ev}_i^*(\gamma_i).$$

We define unramified Gromov-Witten invariants:

$$\langle \gamma_1 \cdots \gamma_n \rangle_{g,\beta}^{uGW} := \int_{u\overline{M}_{g,n}(X,\beta)} \prod_i \operatorname{ev}_i^*(\gamma_i).$$

There are subtle structural differences between uGW and GW invariants:

(ロ)、(型)、(E)、(E)、 E) の(()

We define unramified Gromov-Witten invariants:

$$\langle \gamma_1 \cdots \gamma_n \rangle_{g,\beta}^{uGW} := \int_{u\overline{M}_{g,n}(X,\beta)} \prod_i \operatorname{ev}_i^*(\gamma_i).$$

There are subtle structural differences between uGW and GW invariants:

• In order to glue maps, one has to glue FM degenerations. Hence uGW theory is not a **cohomological field theory** (at least not in the same way as GW theory is).

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

# Theorem (N.'24)

The Conjecture is true. Moreover, the formula above is a **wall-crossing formula**.

<ロト < 団ト < 団ト < 団ト < 団ト 三 のへで</p>

We can define **intermediate** theories that interpolate between Gromov–Witten theory and unramified Gromov–Witten theory.

We can define **intermediate** theories that interpolate between Gromov–Witten theory and unramified Gromov–Witten theory.

Given a map  $f: (C, p_1, \ldots, p_n) \to W$ , to each point  $x \in W$ , and to each bubble  $\mathbb{P}^{\dim} \subset W$ , we can associate weights,

$$w(x) \in \mathbb{Z}, \quad w(\mathbb{P}^{\dim}) \in \mathbb{Z}.$$

The weight w(x) measures how far the map is from being **unramified** over x, while  $w(\mathbb{P}^{\dim})$  measures how **big** the curve is over  $\mathbb{P}^{\dim}$ .

For example, a contracted component of genus g over x contributes 2g - 2 to w(x), so does a curve of genus g over  $\mathbb{P}^{\dim}$  for  $w(\mathbb{P}^{\dim})$ .

We can define **intermediate** theories that interpolate between Gromov–Witten theory and unramified Gromov–Witten theory.

Given a map  $f: (C, p_1, \ldots, p_n) \to W$ , to each point  $x \in W$ , and to each bubble  $\mathbb{P}^{\dim} \subset W$ , we can associate weights,

$$w(x) \in \mathbb{Z}, \quad w(\mathbb{P}^{\dim}) \in \mathbb{Z}.$$

The weight w(x) measures how far the map is from being **unramified** over x, while  $w(\mathbb{P}^{\dim})$  measures how **big** the curve is over  $\mathbb{P}^{\dim}$ .

For example, a contracted component of genus g over x contributes 2g - 2 to w(x), so does a curve of genus g over  $\mathbb{P}^{\dim}$  for  $w(\mathbb{P}^{\dim})$ .

Using ideas of **Ciocan-Fontanine–Kim**'16 and **Zhou**'19 from the quasimap theory, we can establish the wall-crossing formula. In plain English, it says:

Using ideas of **Ciocan-Fontanine–Kim**'16 and **Zhou**'19 from the quasimap theory, we can establish the wall-crossing formula. In plain English, it says:

GW theory = Unramified GW theory + Hodge integrals,

where

$$\mathsf{Hodge} ext{ integrals } := \int_{\overline{M}_{g,m}} \prod_{i} \psi_{i}^{k_{i}} \cdot \prod_{j} \lambda_{j}^{k_{j}}.$$

$$\begin{split} \psi_i &= c_1(L_i), \quad L_{i|C} = T^*_{\rho_i}C, \\ \lambda_j &= c_j(\mathbb{E}), \quad \mathbb{E}_{|C} = H^0(C, \omega_C). \end{split}$$

Using ideas of **Ciocan-Fontanine–Kim**'16 and **Zhou**'19 from the quasimap theory, we can establish the wall-crossing formula. In plain English, it says:

GW theory = Unramified GW theory + Hodge integrals,

where

Hodge integrals := 
$$\int_{\overline{M}_{g,m}} \prod_{i} \psi_{i}^{k_{i}} \cdot \prod_{j} \lambda_{j}^{k_{j}}$$
.

$$\begin{split} \psi_i &= \mathrm{c}_1(L_i), \quad L_{i|C} = T_{p_i}^* C, \\ \lambda_j &= \mathrm{c}_j(\mathbb{E}), \quad \mathbb{E}_{|C} = H^0(C, \omega_C). \end{split}$$

Hodge integrals naturally arise via localisation on  $\mathbb{P}^{dim}$ . In our case, they are invariants associated to parameter spaces of ramifications.

Using ideas of **Ciocan-Fontanine–Kim**'16 and **Zhou**'19 from the quasimap theory, we can establish the wall-crossing formula. In plain English, it says:

GW theory = Unramified GW theory + Hodge integrals,

where

$$\mathsf{Hodge} ext{ integrals } := \int_{\overline{\mathcal{M}}_{g,m}} \prod_i \psi_i^{k_i} \cdot \prod_j \lambda_j^{k_j}.$$

$$\begin{split} \psi_i &= \mathrm{c}_1(L_i), \quad L_{i|C} = T^*_{p_i}C, \\ \lambda_j &= \mathrm{c}_j(\mathbb{E}), \quad \mathbb{E}_{|C} = H^0(C, \omega_C). \end{split}$$

Hodge integrals naturally arise via localisation on  $\mathbb{P}^{dim}$ . In our case, they are invariants associated to parameter spaces of ramifications.

The contribution from Hodge integrals is **universal**, i.e. depends very little on X.
