Surveys on IGRT imaging for paediatrics

Núria Jornet

Servei de Radiofísica i Radioprotecció

Hospital de la Santa Creu i Sant Pau

Barcelona

IGRT improves RT accuracy and precision but it involves an additional dose (0.3 to 3 cGy)

Children have increased risk of radio-induced second malignancies:

- Age
- Genetic susceptibility
- Radiation dose

There **is** a lack of consensus guidelines on the optimal use of IGRT in pediatrics patients

Manufacturer default image acquisition protocols, designed for adults, are used for children

There is a lack of guidelines for optimizing paediatric IGRT with low as reasonably achievable.

Low dose 3D protocols for children decrease the dose by a factor of 10 maintaining position accuracy.

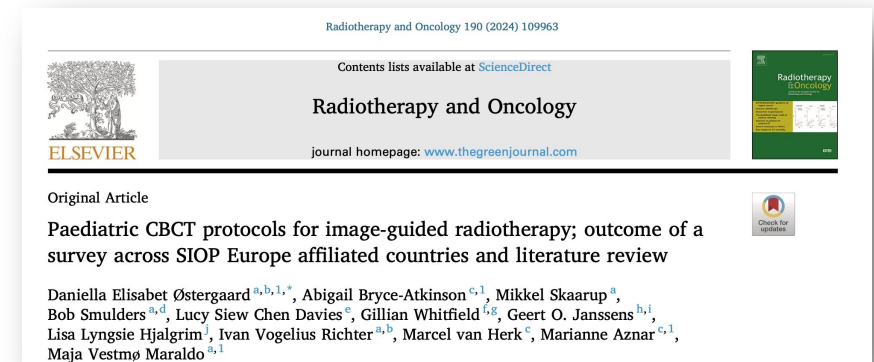

Evaluation of the international patterns of practice of IGRT in pediatrics

2015: Survey to the International Paediatric Radiation Oncology Society members

2020: Practice patterns and recommendations for Pediatric IGRT: A Childrens Oncology Group Report

2022: Survey conducted among 246 SIOPE-affiliated centres (35 countries)

Survey 2015

Data collected 1 sept-31 Oct 2015

Sent to 119 international Paediatric Radiation Oncology Society members
Eligible those centers treating adults and Paediatrics having IGRT capability
Aim: Evaluation of patterns of IGRT practice in paediatric vs adults

Survey description:

1. Five-item survey
2. Closed and open questions

Survey 2015

Response rate: 43/119

Only 16/35 had a **separate protocol** for paediatrics

3/16 IGRT individualized (number of fractions, dose, margins, treatment intent, treatment machine...)

Most respondents **SAME imaging frequency** for paediatrics and adults (71% torso, 74% CNS, 83% other sites)

50% daily imaging

19% individualized approach

Nearly half of the respondents use the **SAME scanning parameters** for adults and paediatrics

Survey 2015

Methods to reduce radiation exposure for IGRT

- Reduction imaging frequency: 5
- kV imaging : 4
- reduce kV and mAs: 2
- reduced field size : 2

Survey 2015

Recommendations

- Reduction of mAs for CBCT (40-100 mAs)
- Exposure parameters adapted to size/weight (not only to age)
- Education to Radiation Oncologists and RTTs on dose optimisation in IGRT
- Need for consensus recommendations to guide clinical decision-making on optimal IGRT use for paediatric patients
- Need for guidelines for size specific dose optimization approaches

Literature review on published paediatric CBCT protocols for CBCT (2022)

Table 1

Protocols extracted from the literature and grouped by the purpose of the study.

Author, year	Anatomy	Age (years)	Vendor	kVp	mAs	No. of projections	Bowtie Filter used	Image quality evaluation	Registration evaluation

DOSE CALCULATION STUDY									
Dzierma, 2018 [18]	Abdomen, thorax	5–17	Siemens	121	200–700	200–360	–	–	–
Son, 2017 [37]	Mixed sites	5	Varian	100–125	72–720	360–655	✓	–	–
Kim, 2016 [38]	Abdomen	5	Varian	125	40–80 mA, 10–25 ms [†]	650–700	✓	–	–
Deng, 2012 [10]	Abdomen, CNS	2.75–6	Varian	60–125	80 mA, 13–25 ms [†]	–	✓	–	–
Ding, 2010 [20]	HN, thorax, pelvis	2.6	Varian	100–125	10–80 mA, 20–25 ms [†]	–	✓	–	–

Heterogeneous settings and parameters suggest lack of consensus

Some of the optimization studies did not address visual image quality (4/7)

✓ = yes, × = no, - = not specified, * = protons centre, † = mAs per projection, otherwise total mAs is reported directly from the study or by calculation from the reported number of projections and mAs per projection, CSI = craniospinal irradiation, HN = head and neck, CNS = central nervous system.

Survey SIOPE 2022

Data collected 6 sept-22 Oct 2022

Sent to 236 centers/ 35 SIOPE affiliated countries

Survey description:

1. Demographic information
2. CBCT settings for brain/head site
3. CBCT settings for abdominal sites

Data analysis

Removal of duplicated responses

When ranges of quantitative parameters were reported, two protocols were generated (lowest and top values)

CBCT protocols reporting <10 projections removed from analysis

Suspected errors clarified with responders

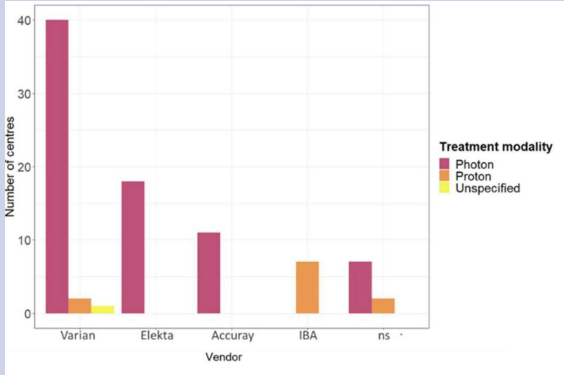

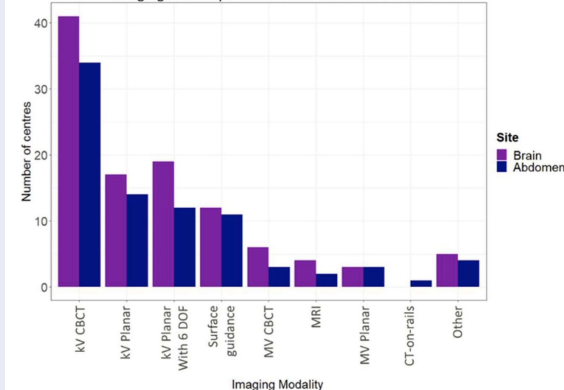

Survey SIOPE 2022

Main findings

Daily CBCT is widely used

Large variation in technical acquisition parameters (more consistency for head/brain)

Although low-dose CBCT for IGRT is feasible for paediatric patients only 39% of surveyed centers have optimized CBCT

URGENT need FOR IMPLEMENTING optimised paediatric IGRT protocols.

Wrap up from the two surveys

Recommendations

From 2015 to 2022 increase of the use of daily CBCT

Still most of the centers have not optimized image protocols

The recommendations from 2015 survey still up-to-date:

- Exposure parameters adapted to size/weight (not only to age)
- Education to Radiation Oncologists and RTTs on dose optimisation in IGRT
- Need for consensus recommendations to guide clinical decision-making on optimal IGRT use for paediatric patients
- Need for guidelines for size specific dose optimization approaches

To be adapted for RT imaging

One size does not fit all...

There's no question — CT helps us save kids' lives!
But...When we image, radiation matters!
Children are more sensitive to radiation.
What we do now lasts their lifetime.
So, when we image, let's image gently.
More is often not better.
When CT is the right thing to do:

- Child size the kVp and mA
- One scan (single phase) is often enough
- Scan only the indicated area

A family message from the Alliance for Pediatric Safety in Pediatric Imaging.

To be adapted for RT imaging

Imaging for all kids

Radiation dose for a pediatric abdominal scan

Entity	Radiation Dose (mSv)
Children's Hospital of Wisconsin	1.3
National standard (American College of Radiology)	3.0

mSv = millisievert

At Children's Hospital of Wisconsin, we strive to use less radiation in our tests than any other health system. Our expertise allows us to conduct imaging exams the right way, at the right time, and only when necessary — which means providing the best and safest care for your child.

3.6% – Our repeat rate (doing an exam more than once) is well below the national average of 5.5%

1,000+ Years of combined experience in the field of pediatric imaging

Some kids need a little extra to get them through an exam. Whether that means playing music, singing songs, watching videos or enjoying a star machine, we'll do what it takes.
