# Disclosures

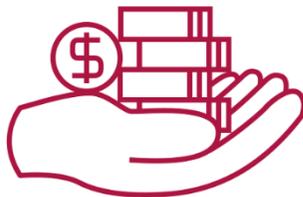

## Travel

- Nothing to declare

## Research grant

- AAA/Novartis
- Oncobeta
- Life Molecular

## Honorarium

- GE Healthcare
- Oncobeta

## Advisory Board/Consultant

- GE Healthcare
- Novartis
- Lilly

# Agenda

- current therapies and future developments
- most important radionuclides / pharmaceuticals
  - Beta Particles
    - Iodine-131
    - Lutetium-177
    - Yttrium-90
    - Samarium-153
    - Rhenium-188
  - Alpha Particles
    - Radium-223
    - Actinium-225
  - „New“ radionuclides / pharmaceuticals
    - Terbium-161

Note: Radiation protection issues are covered in the corresponding lecture on radiation protection.

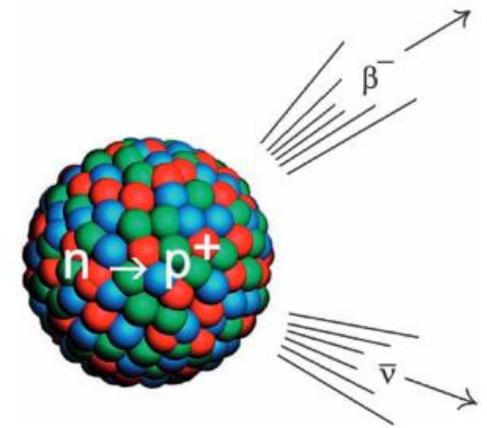

# Current therapies and future developments

- use of  $^{131}\text{I}$  for therapy of malignant and benign thyroid diseases still dominant
  - incidence of benign thyroid diseases is decreasing → partly due to better iodine supply
  - MIBG-therapy
- $^{177}\text{Lu}$  will be increasingly used
  - pharmaceuticals like DOTA-TATE and PSMA-617 will have an growing role in clinical arena
    - successful phase III-trials (NETTER-I, NETTER-II for NET and VISION for prostate cancer)
  - possibly the most widely used in the future
  - new therapeutic agents are on the horizon (i. e. FAPI, Bombesin (GRPr))
- medical devices, such as microspheres labeled with  $^{90}\text{Y}$  are used in the treatment of hepatocellular carcinoma (HCC) and liver metastases
- alpha emitters will enter clinical arena
  - already established →  $^{223}\text{Ra}$  in the treatment of bone metastasis of prostate cancer
  - $^{225}\text{Ac}$  and  $^{212}\text{Pb}$  labeled pharmaceuticals will be used more frequently in future
- New beta emitters
  - $^{161}\text{Tb}$ ,  $^{67}\text{Cu}$ , ...

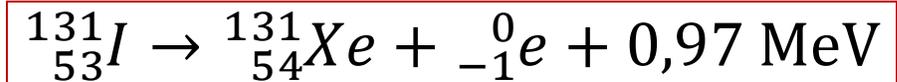

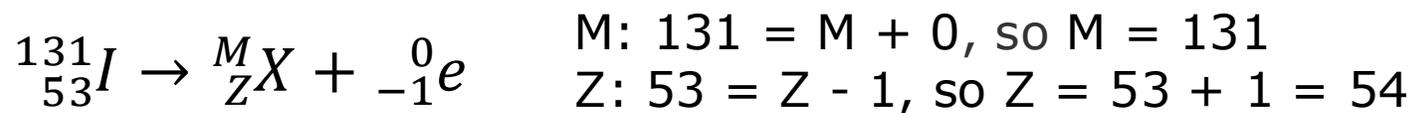

# PHARMACEUTICALS LABELED WITH $\beta^-$ - RADIONUCLIDES

# Beta Particles – Interaction with matter

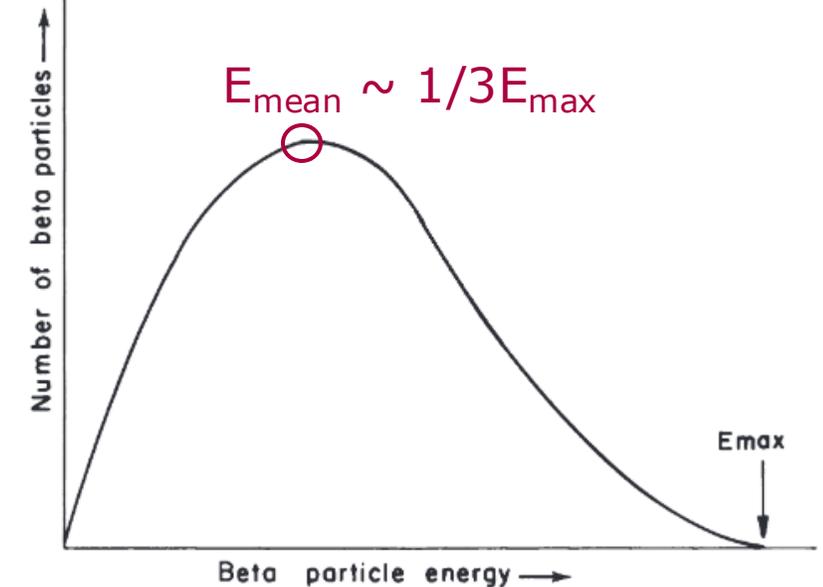

$n \rightarrow p^+ + \beta^- + \bar{\nu}$  → caused by neutron/proton (n/p) imbalance

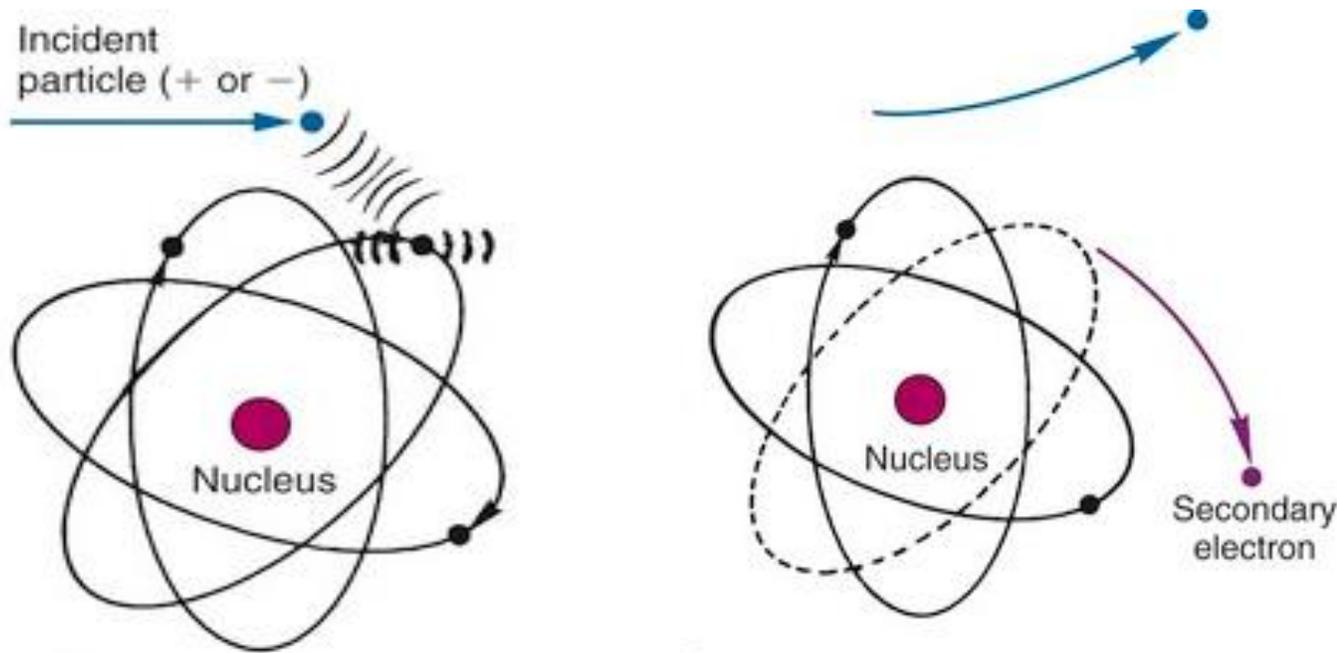

- occurs when n/p ratio is too high
- Neutron → Proton + Electron + Antineutrino
- Atomic number +1, mass number unchanged
- often accompanied by gamma emission

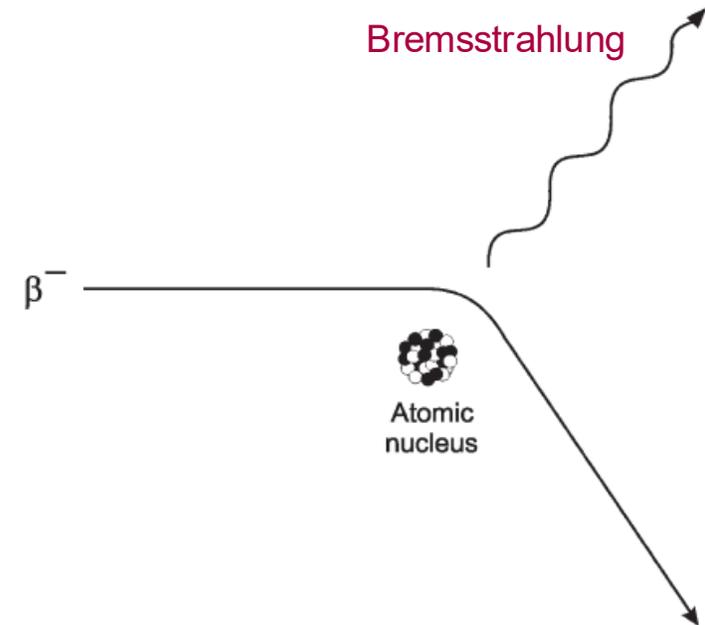

Continuous energy spectrum  
Range:  $0 \rightarrow E_{\text{max}}$ , most  $\approx \frac{1}{3} E_{\text{max}}$

# Beta Particles – Interaction with matter

Interaction with an orbital electron resulting in ionization. Less-close encounters may result in atomic excitation without ionization.

Bremsstrahlung: An electron is deflected by a nucleus and loses kinetic energy → emission of a photon of x-radiation

<https://radiologykey.com/interaction-of-radiation-with-matter/>  
L'Annunziata Michael F. Radioactivity. Elsevier Science B.V. 2007

# Beta Particles - Range in matter

$$r = \begin{cases} \frac{1}{\rho} (0,542 \cdot E_{max} - 0,133); & E_{max} > 0,8 \text{ MeV} \\ \frac{1}{\rho} 0,407 \cdot E_{max}; & 0,15 \text{ MeV} < E_{max} < 0,8 \text{ MeV} \end{cases}$$

Glendenin et al. 1948

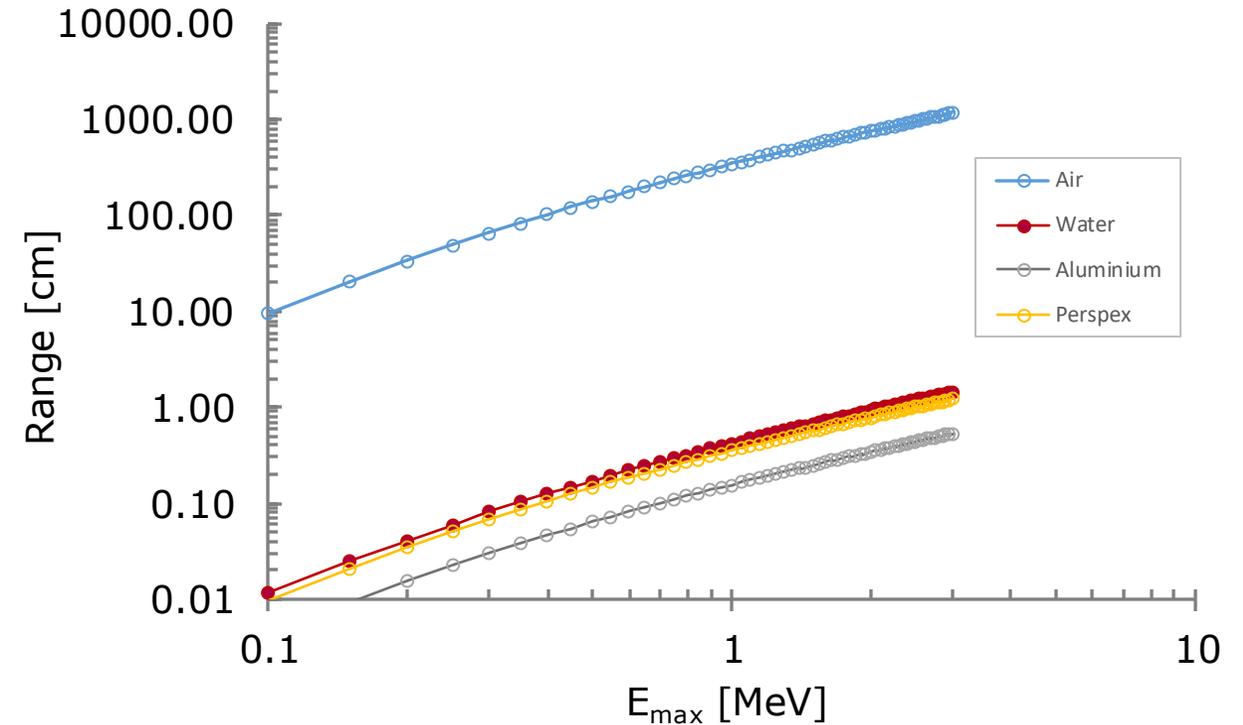

$$r = \frac{1}{\rho} \cdot 0,11 \cdot \left( \sqrt{1 + 22,4 \cdot E_{max}^2} - 1 \right); \quad 0 < E_{max} < 3 \text{ MeV}$$

Paul and Steinwedel. 1955

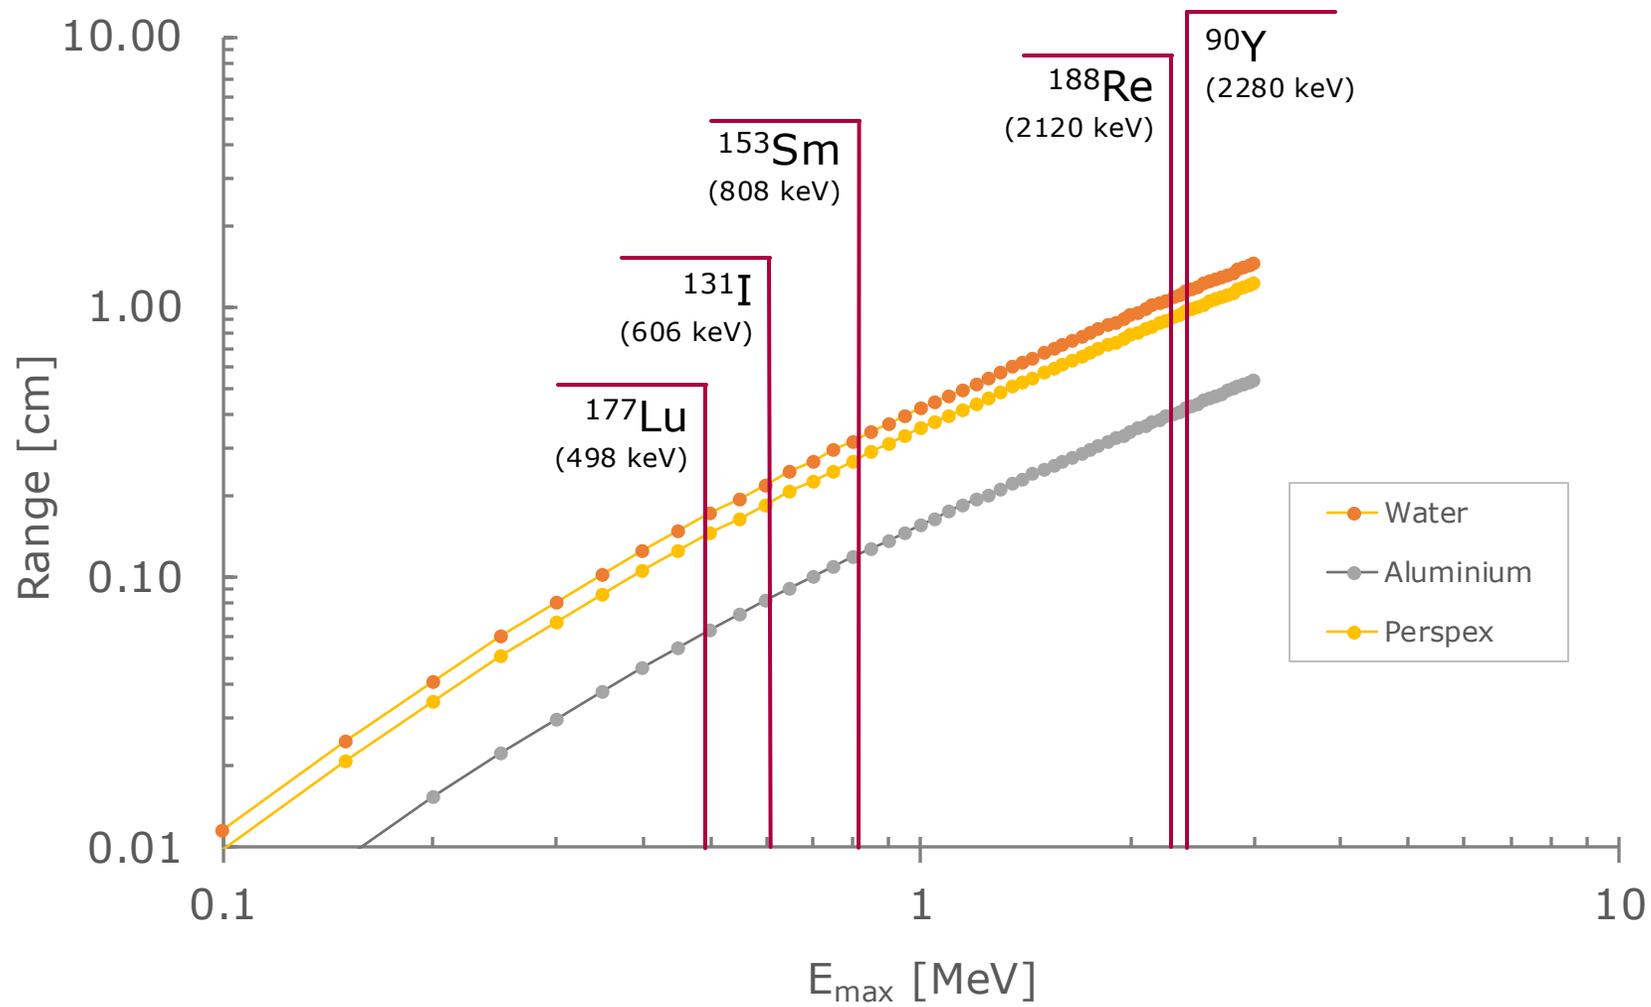

$r$ : range in matter; [ $r$ ] = cm

$\rho$ : density of matter; [ $\rho$ ] = g/cm<sup>3</sup>

<https://mirdsoft.org/products/MIRDspecs>

# Beta Particles - Range in matter, shielding

Shielding of beta particles  
Rule of thumb

Thickness of absorber

$$D[\text{cm}] \approx 0,5 \cdot E_{max}[\text{MeV}]$$

$$Y_{90}: 0,5 \cdot 2,3 \text{ MeV}$$

$$D \approx 1 \text{ cm Perspex}$$

# THERAPEUTIC PROCEDURES RADIONUCLIDES

## NM-Therapies - Mechanisms of Uptake

- Specific cellular active transporters
  - e. g. NIS for  $^{131}\text{I}$  or norephrine transporters for [ $^{131}\text{I}$ ]mIBG
- Selectivity for certain receptors or antigens (+/- internalization)
  - e. g. peptides, small molecules, antibodies  
PSMA- or DOTATATE-therapies
- Local deposition
  - e. g. SIRT (radiolebaled spheres) or RSO

# NM-Therapies - Administration Routes

## Systemic

- Oral: Liquid or Solid (Capsule)
  - e. g.  $^{131}\text{I}$
- Intra-venous / (Intra-arterial)

## Locoregional

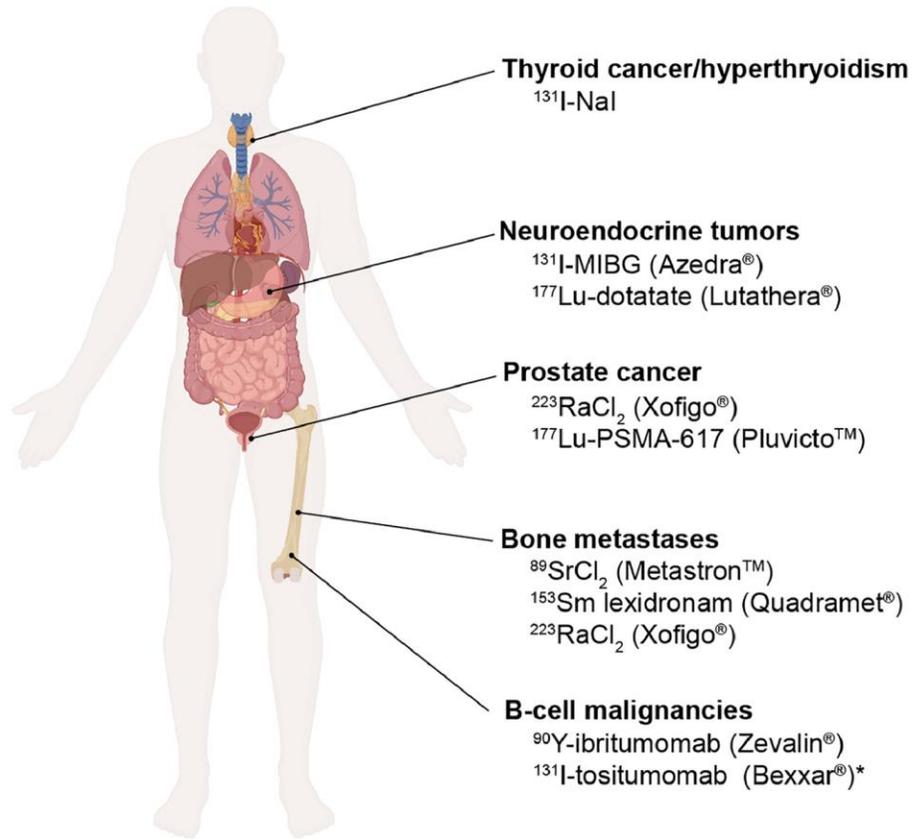

- Intra-arterial: hepatic radioembolization (SIRT)
- Intra-cavitary: intraperitoneal/intratumoral
- Intra-articular: radiosynovioirrtesis
- Cutaneous application

# NM-Therapies - Radionuclides

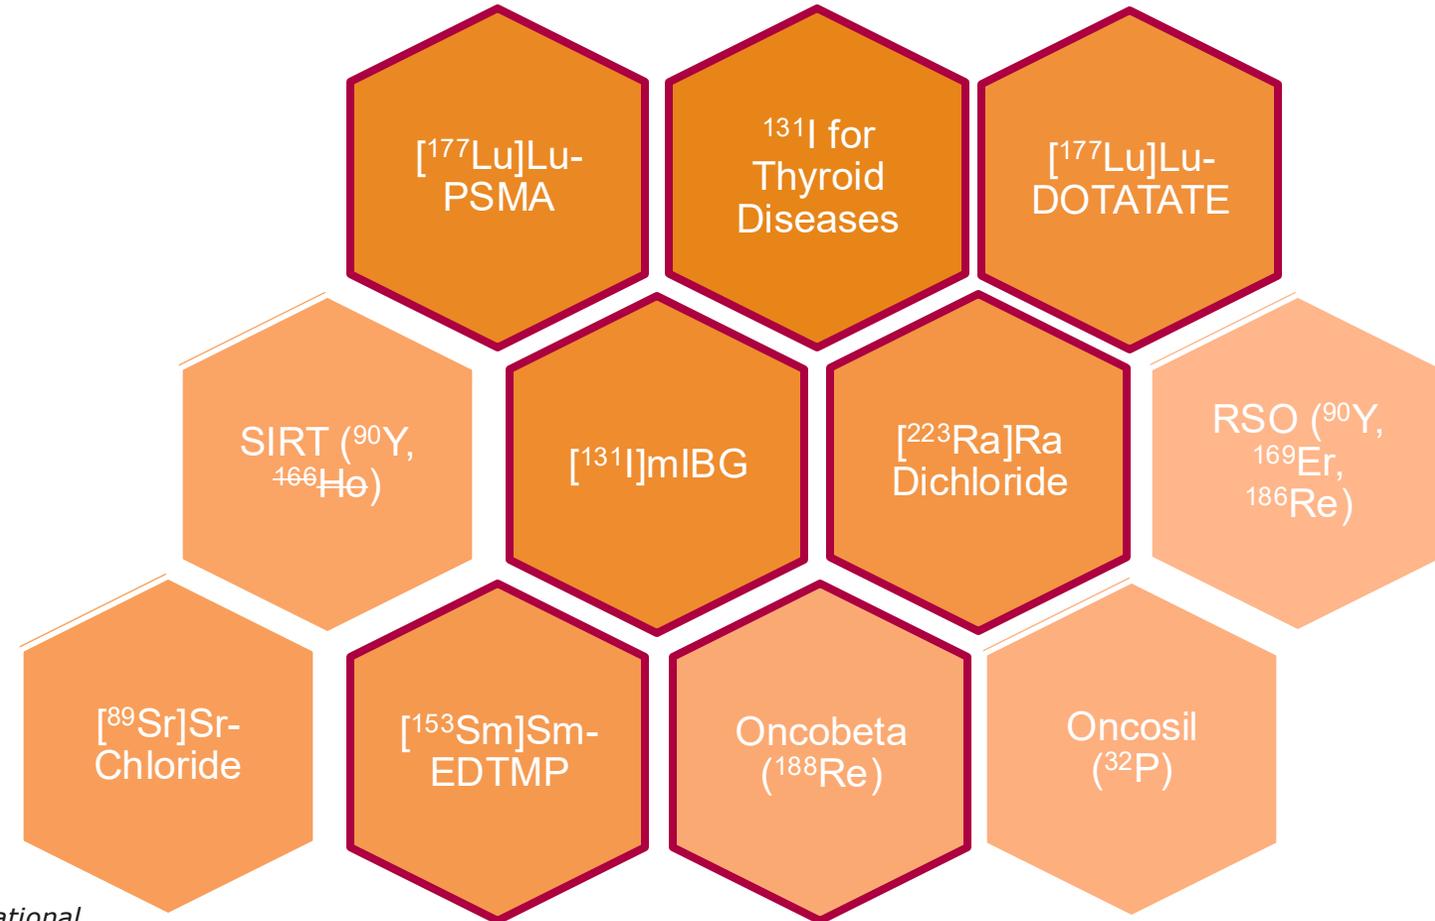

Radio-nuclide	Type	Energy [MeV]	Gamma Energy used for Imaging [keV]	Half Live [d]
<sup>131</sup> I	$\beta^-$	0,61; Mean: 0,2	364	8,0

<sup>186</sup> Re		1,1; Mean: 0,4	137	3,7

# THERAPEUTIC PROCEDURES

## FDA-approved radiopharmaceutical therapy

## NM therapy practices in Europe

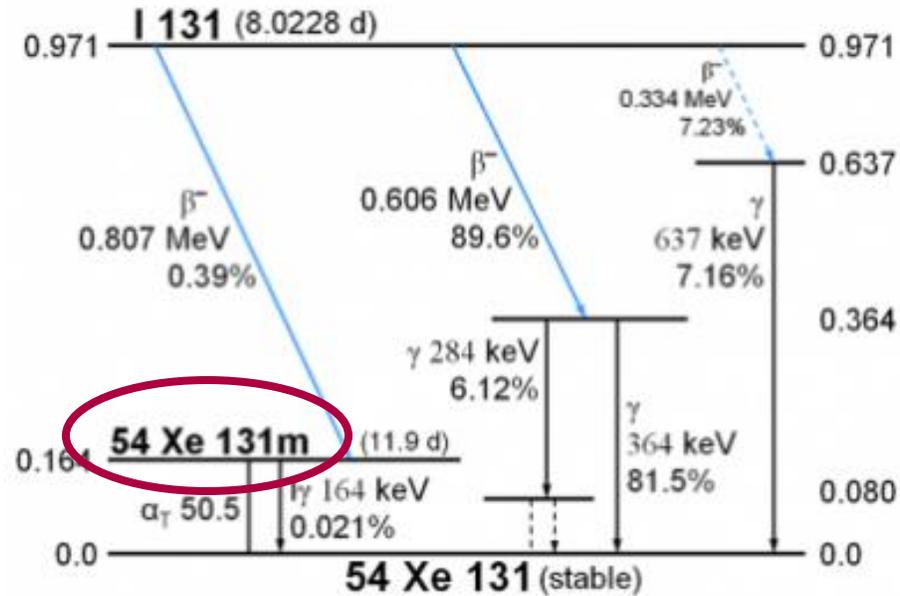

Salerno, Kilian E et al. "A Primer on Radiopharmaceutical Therapy." *International journal of radiation oncology, biology, physics* vol. 115,1 (2023): 48-59.

# IODINE-131

# Iodine-131

Physical Half-Life: 8.05 d

## PHYSICAL DATA

### Gamma

364 keV (82% abundance)  
637 keV ( 7% abundance)

### Beta

192 keV (89% abundance / average)  
606 keV (89% abundance)

Maximum Beta Range in Water: 2 mm  
Maximum Beta Range in Air: ~165 cm

## SHIELDING

### Betas and electrons (complete)

3,3 mm of plastic

### Gamma and X-rays

HVL (Lead): 2 mm  
TVL (Lead): 11 mm

## INTERNAL EXPOSURE FOR STAFF

**Critical Organ:** Thyroid

### Effective Doses per Unit intake (Sv/Bq)

Ingestion: 2.2E-8

**ALI<sub>ingestion</sub> ~ 1 MBq**

Inhalation: 1.1E-8

**ALI<sub>inhalation</sub> ~ 2 MBq**

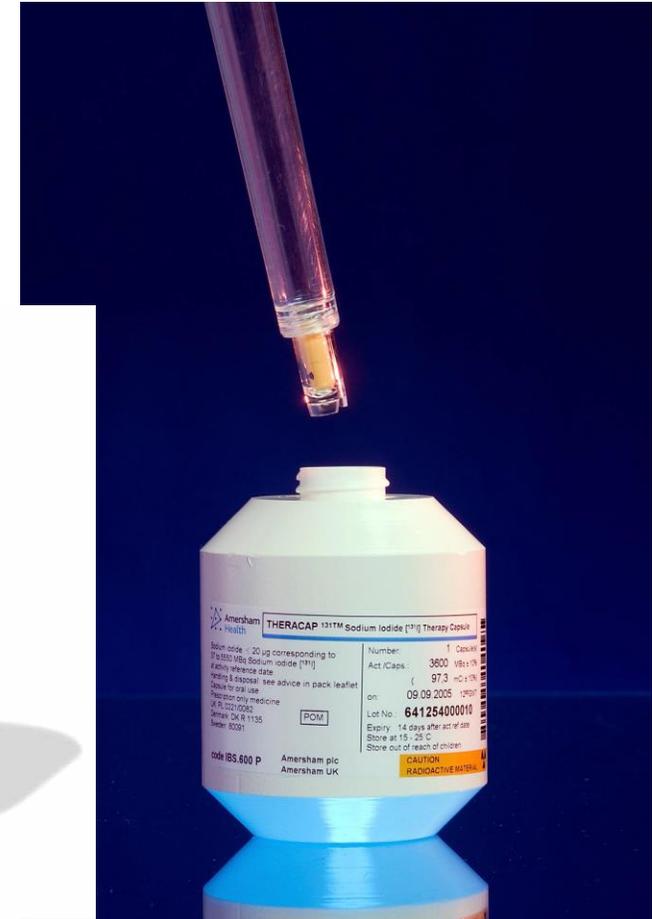

Delacroix et al. RADIONUCLIDE AND RADIATION PROTECTION DATA HANDBOOK 2002

## $^{131}\text{I}$ -Therapies for treatment of thyroid diseases

- **Common Use:** Radioiodine therapy is widely used across Europe for treating hyperthyroidism (like Graves' disease) and differentiated thyroid cancers (such as papillary and follicular thyroid cancer)
- **Guidelines and Standards:** Treatment follows guidelines set by organizations like the EANM and national societies and health bodies to ensure effectiveness, and standardized dosing protocols  
→ fixed activities vs dosimetry
- **Hospitalization Rules:** Some European countries require hospital stays after therapy depending on the dose administered, while others allow outpatient treatment if radiation exposure to others remains below legal limits
- **Access and Availability:** Access to radioiodine therapy is generally good across Europe, but waiting times and availability can vary significantly between countries and even between regions within a country  
→ however, availability needs to be watched: very recently, closure of production facility in Germany

# Iodine-131 – Capsules - Treatment of thyroid diseases

# Iodine-131 – mIBG therapy

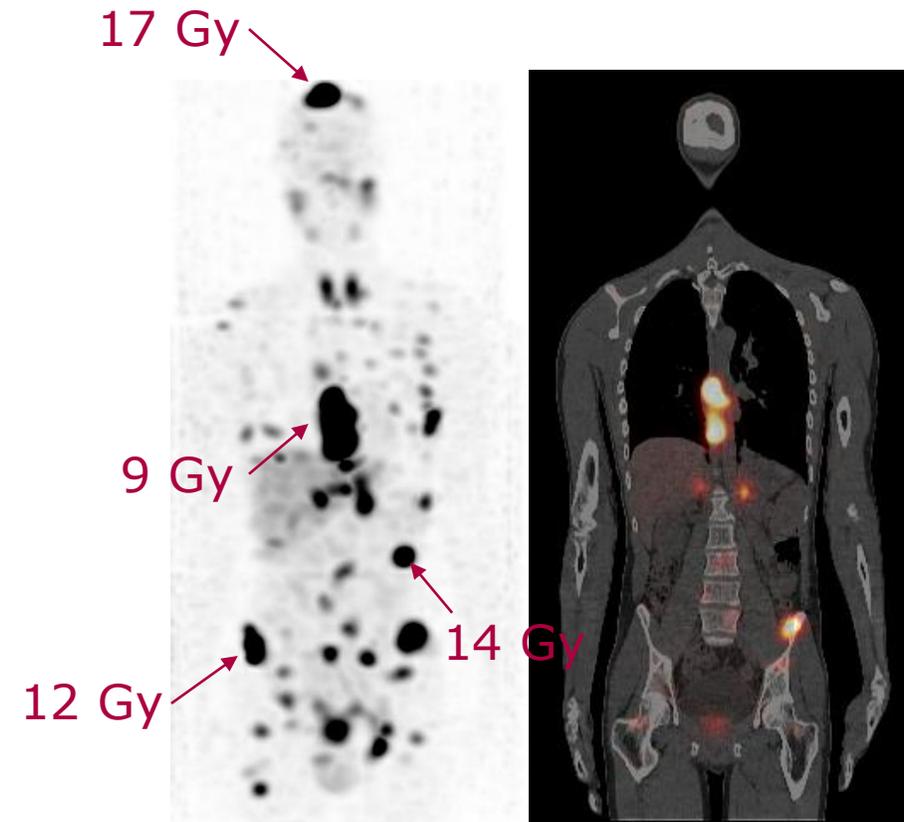

Meta-iodobenzylguanidine, or Iobenguane

## Indication: Treatment of

- pheochromocytoma
- paraganglioma
- carcinoid tumour
- Stage III or IV neuroblastoma
- Metastatic or recurrent medullary thyroid cancer
  
- usual single-administered activities range between 3.7 and 11 GBq, may be modified for medical reasons

♂ 17 y, met. Neuroblastoma  
4,2 GBq I-131-mIBG  
Intratherapeutic Dosiemtry

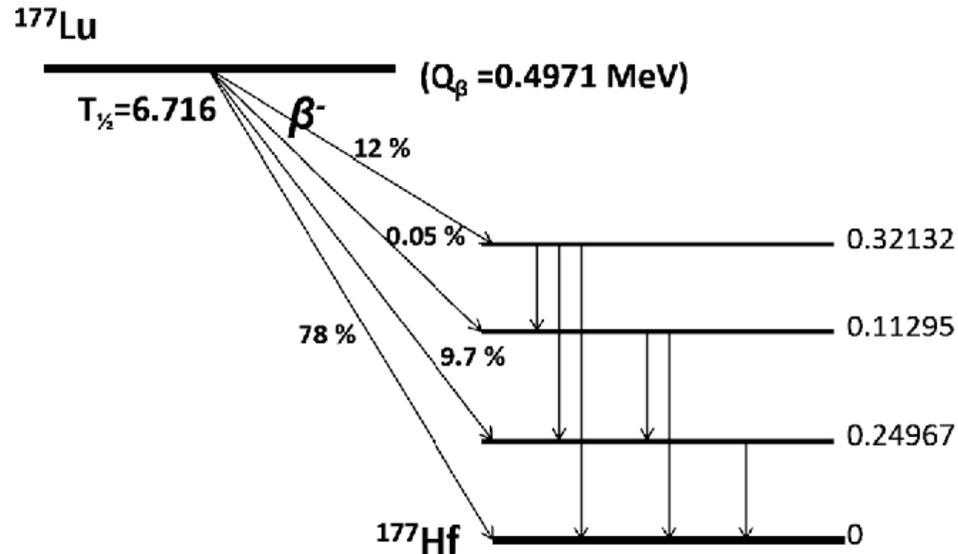

# Iodine-131 – Take home

- Iodine-131 is a useful as a therapeutic agent, due to emission of beta particles
  - used for I-131-treatment of thyroid diseases (malign and benign)
  - $^{131}\text{I}$ -mIBG-therapy of neuroendocrine tumors
- gamma rays are also emitted → useful for imaging, need to be considered in radiation protection
- at environmental temperature, Iodine is a gas  
→ even when it is in solution or embedded in a capsule, it is volatile and it is released in air
- Iodine capsules are solid radioactive source, but not a sealed source !
- In the decay of  $^{131}\text{I}$ , radioactive  $^{131m}\text{Xe}$  (T1/2 = 11.9 d) is produced in little amount ( ~ 1 %)
- In addition to any consideration on shielding and prevention of surface contamination, Iodine-131 should ALWAYS be manipulated within a vented hood

# LUTETIUM-177

# Lutetium-177

Physical Half-Life: 6.7 d

## PHYSICAL DATA

### Gamma

113 keV (6% abundance)  
208 keV (11% abundance)

### Beta

Betas: 490 keV (79% abundance/max)  
160 keV (average)

Maximum Beta Range in Water: 1,4 mm  
Maximum Beta Range in Air: ~140 cm

## SHIELDING

### Betas and electrons (complete)

1,5 mm of plastic

### Gamma and X-rays

HVL (Lead): 0,6 mm

TVL (Lead): 2,1 mm

## INTERNAL EXPOSURE FOR STAFF

**Critical Organ:** Lower Large Intestine (ingestion)  
Lung (inhalation)

### Effective Doses per Unit intake (Sv/Bq)

Ingestion: 6,43E-9

**ALI<sub>ingestion</sub> ~ 3 MBq**

Inhalation: 3,33E-9

**ALI<sub>inhalation</sub> ~ 6 MBq**

# Use of Lutetium-177

RESULTS BY YEAR

2,037 results

Page 1 of 204

Download icon | Reset button

Pubmed.org  
Keywords: Lutetium-177 OR Lu-177

# Why Lutetium-177 ?

- commercially available
- favourable physical properties
  - medium energy  $\beta^-$ -emitter ( $E_{\beta_{\max}} = 0.497$  MeV)
  - half-life of 6.7 days
  - co-emission of low energy gammas ( $E_{\gamma} = 113$  and 208 keV)
- favorable radiochemistry
  - forms very stable complexes with DOTA and similar chelators
  - compatible with well-established targeting vectors
- clinical success (treatment of NET and PCa)

## Lutetium-177–PSMA-617 for Metastatic Castration-Resistant Prostate Cancer

O. Sartor, J. de Bono, K.N. Chi, K. Fizazi, K. Herrmann, K. Rahbar, S.T. Tagawa, L.T. Nordquist, N. Vaishampayan, G. El-Haddad, C.H. Park, T.M. Beer, A. Armour, W.J. Pérez-Contreras, M. DeSilvio, E. Kpamegan, G. Gericke, R.A. Messmann, M.J. Morris, and B.J. Krause, for the VISION Investigators\*

# [<sup>177</sup>Lu]Lu-DOTA-TOC / DOTA-TATE-therapy - Treatment option for neuroendocrine tumors

- Neuroendocrine tumors (NET) are a relatively rare disease – incidence  $\sim 0,2 / 100.000$
- most of the NET are diagnosed at advanced stages
- if local treatment isn't possible, systemic therapies are needed (chemo, immunotherapy, somatostatin analogues, ...)
- PRRT – Peptide receptor radionuclide therapy, a second or third-line therapy for treatment of NET

Taal BG, Visser O. Neuroendocrinology. 2004;80 Suppl 1:3-7.  
 Minczeles, N et al. Curr Oncol Rep 23, 46 (2021)

# [<sup>177</sup>Lu]Lu-DOTA-TOC / DOTA-TATE-therapy - Treatment option for neuroendocrine tumors

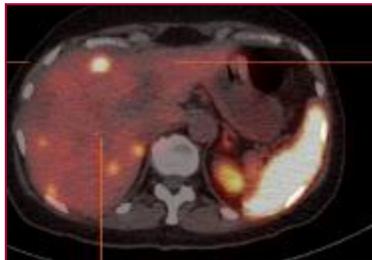

- Therapy has been developed and optimized mainly in the Netherlands (Rotterdam group), Italy, Sweden and Germany
- NETTER-I- Phase III-trial → major breakthrough
  - showed significant improvements in progression free survival and response rate
  - approved by FDA, EMA for GEP-NET → [<sup>177</sup>Lu]Lu-DOTA-TATE (Lutathera®)
- Lutathera® treatment:
  - 4 cycles with 6-10 weeks intervals
  - 7.4 GBq prescribed activity (depending on kidney function) infused in 30 min
  - infusion of amino acids for renal protection

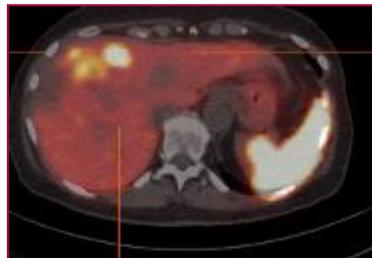

Strosberg J et al. N Engl J Med 2017; 376:125-135

# Example – patient with small intestine carcinoid

# [<sup>177</sup>Lu]Lu-PSMA-617-therapy – treatment of prostate cancer

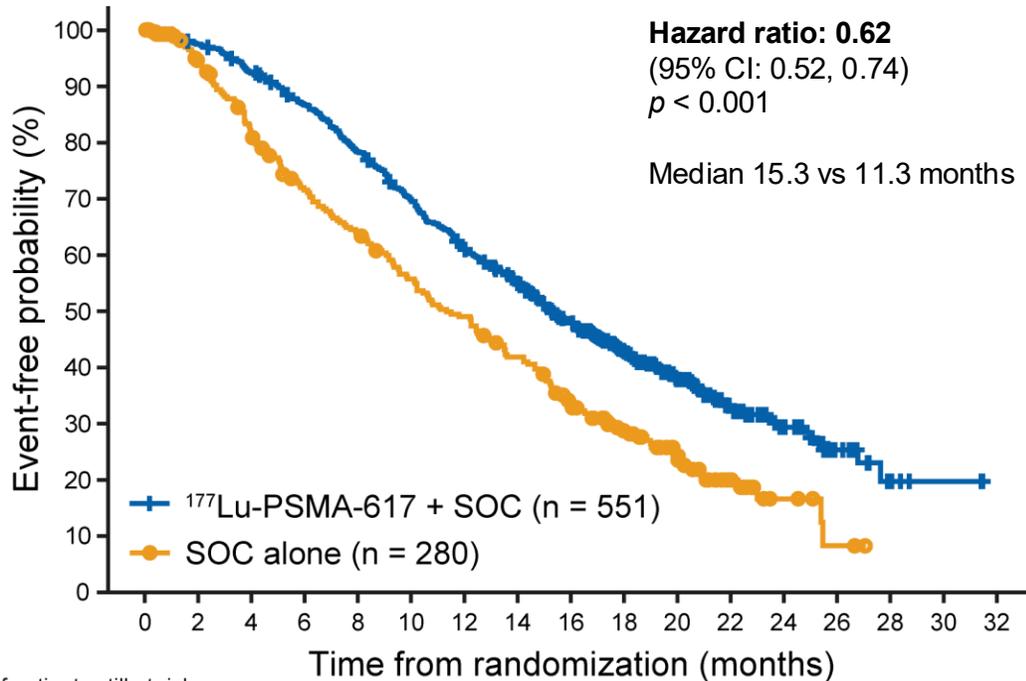

- Prostate cancer is the most common cancer and the third leading cause of cancer death among men in Europe.
- Androgen deprivation is the mainstay of advanced PC treatment; despite initial responses, almost all patients progress to CRPC/mCRPC
- For treatment of mCRPC a number of systemic therapies are available
- For radiotherapy, predominantly lutetium-177 labeled peptides targeting PSMA are used
- early clinical studies on the use of [<sup>177</sup>Lu]Lu-PSMA therapy have yielded promising results
- **VISION-trial, phase III-study**
  - 831 of 1179 screened patients were randomized
  - 6 x 7.4 GBq/cycle with 6-8 weeks interval

# Alternate primary endpoints

## <sup>177</sup>Lu-PSMA-617 prolonged overall survival

### All randomized patients (N = 831)

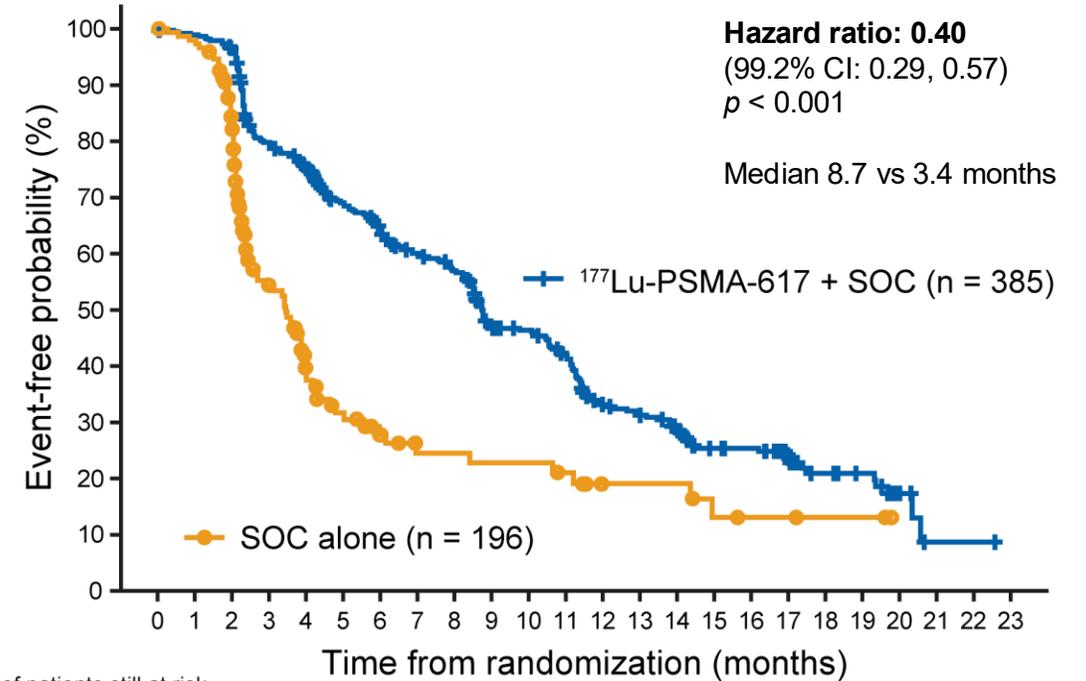

Number of patients still at risk

<sup>177</sup> Lu-PSMA-617 + SOC	551	535	506	470	425	377	332	289	236	166	112	63	36	15	5	2	0

# Summary for Lutetium-177

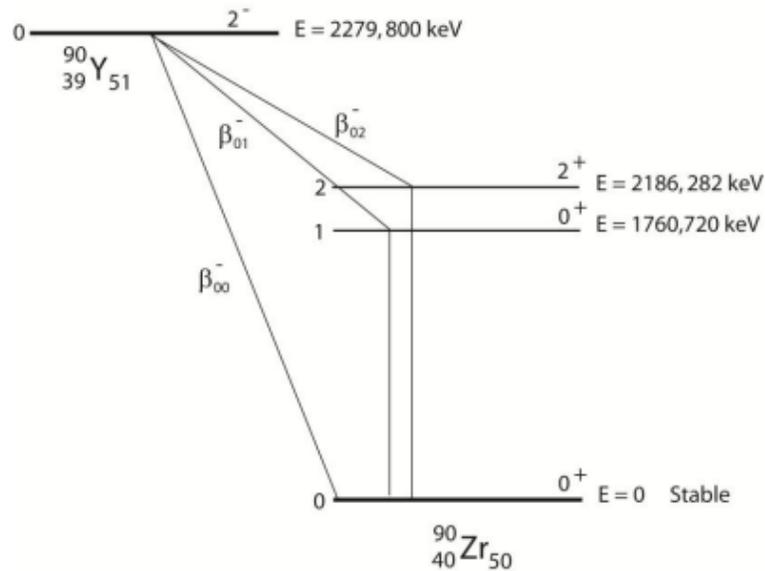

- energy emitted by beta radiation is lower compared to iodine-131
- nevertheless, therapeutic activities used can be significant, e.g. 7400 MBq !
- $^{177}\text{Lu}$  emits a gamma dose per unit of activity lower even to  $^{99\text{m}}\text{Tc}$
- widely used in treatment of NET and prostate cancer
- an increased use of Lutetium-177 will be seen in future

→ see lecture on non-I-131-therapies

# YTTRIUM-90

# Yttrium-90

Delacroix et al. RADIONUCLIDE AND RADIATION PROTECTION DATA HANDBOOK 2002

# Principles of Selective intra-arterial radiation therapy (SIRT)

- Option to treat patients with primary and secondary liver cancer
- majority of liver tumors receive blood supply by the hepatic artery
- Minimally invasive procedure
- Trans-femoral catheter access to hepatic artery and the tumour supplying vessels
- Radioactive microspheres to deliver radiation directly via the hepatic artery (catheter) to the site of the liver tumors

# SIRT TREATMENT ALGORITHM WITH $^{90}\text{Y}$ MICROSPHERES

## Work-up

- Lung shunt assessment
- Intrahepatic distribution
- Extrahepatic deposition

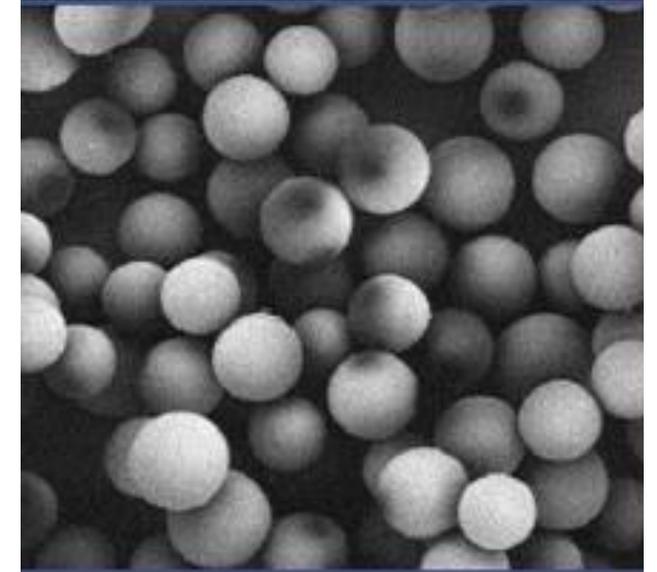

## SIRT Treatment

## Dose Verification

Treatment follow-up  
(e.g. SPECT/CT  
PET/CT)

## two Yttrium-90 based devices

- First of all, SIRT systems are approved as medical devices, not radiopharmaceuticals!
- Resin microspheres (SIR-Spheres<sup>®</sup>, Sirtex)
  - <sup>90</sup>Y is coated on the surface of the spheres
  - particle size: 20-60 μm; activity per particle: 50 Bq
  - about 20-40 million particles per administration
  - uniform dose biodistribution
- Glass microspheres (TheraSphere<sup>®</sup>, Boston Scientific)
  - <sup>90</sup>Y is produced by neutron activation inside the glass matrix (<sup>89</sup>Y is an integral constituent of the glass)
  - particle size: 20-30 μm; activity per particle: 2500 Bq
  - about 1.2 to 8 million particles per administration
  - less embolic effect on microvessels
  - potential influence of gravity on biodistribution

## Rhenium-SCT<sup>®</sup> - mechanism of action

- Local irradiation of the tissue surface using Re-188 → brachytherapy
- Therapeutic penetration depth of beta-emitting Re-188 is approx. 2-3 mm
- Beta particles cause damage to the first layers of skin and trigger a local immune response
- Required Activity is device lesion specific (depending on lesion area and depth) → Dosimetry

Querschnitt der Haut

# ACTINIUM-225

# [<sup>225</sup>Ac]Ac-PSMA-617- for treatment of mCRPC

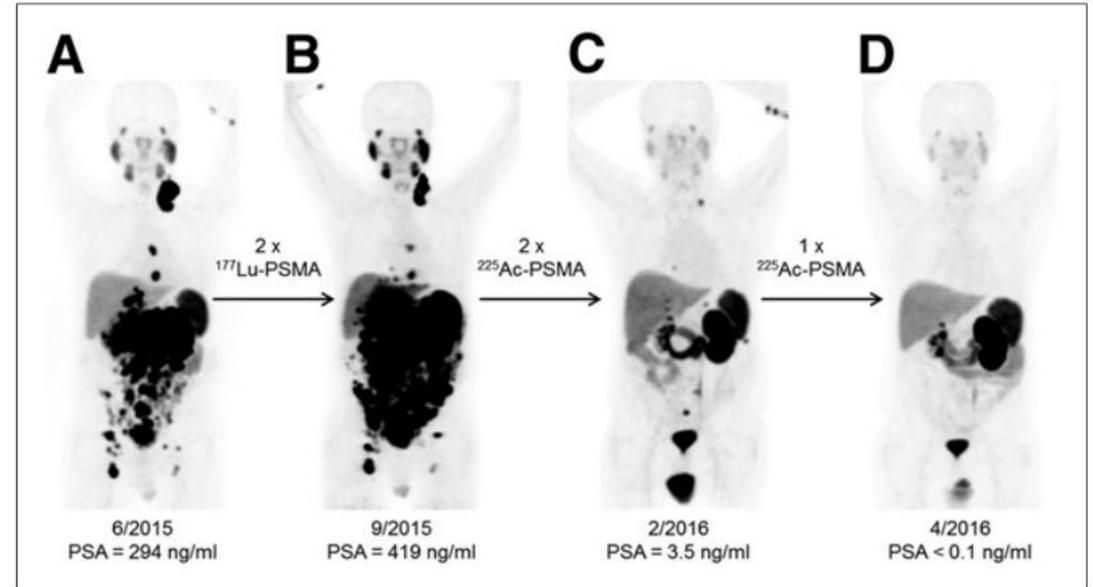

Kassis, A.I. 2008. Therapeutic Radionuclides: Biophysical and Radiobiological Principles. Seminars in Nuclear Medicine 38, 358-366

# [<sup>225</sup>Ac]Ac-PSMA-617- therapy of mCRPC

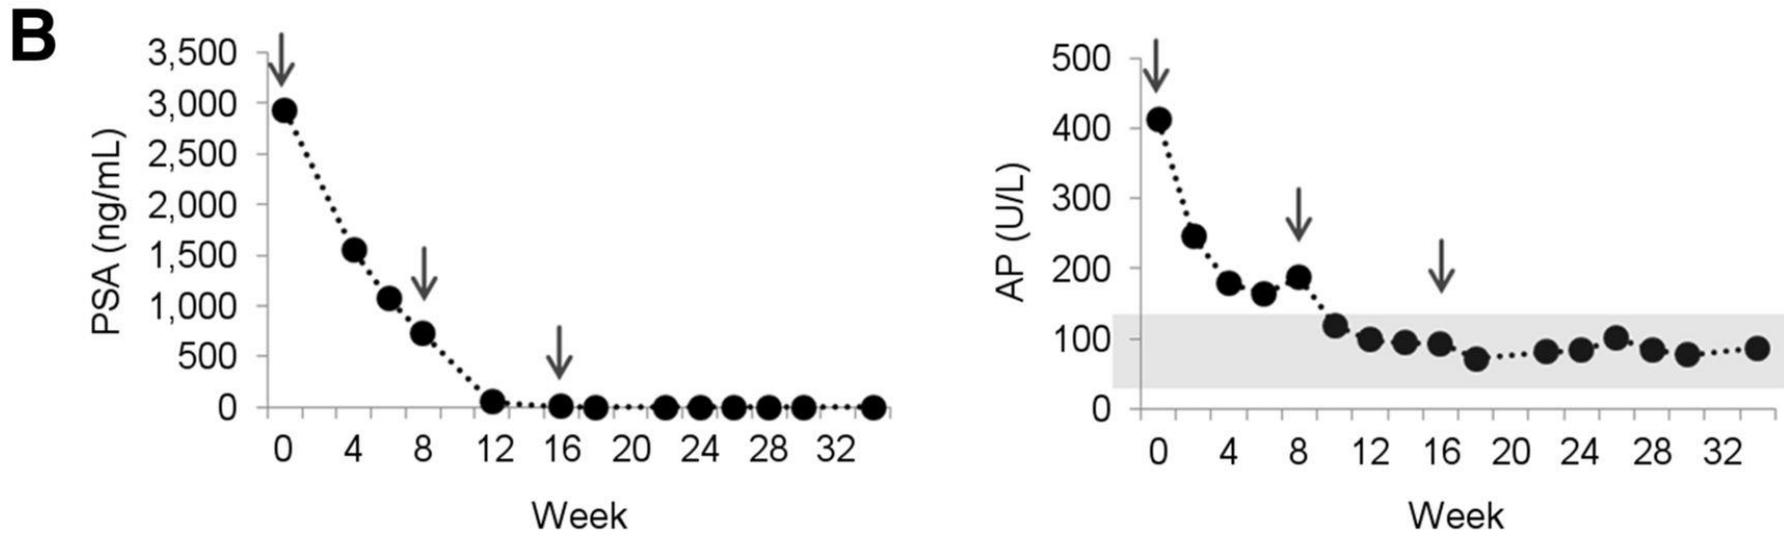

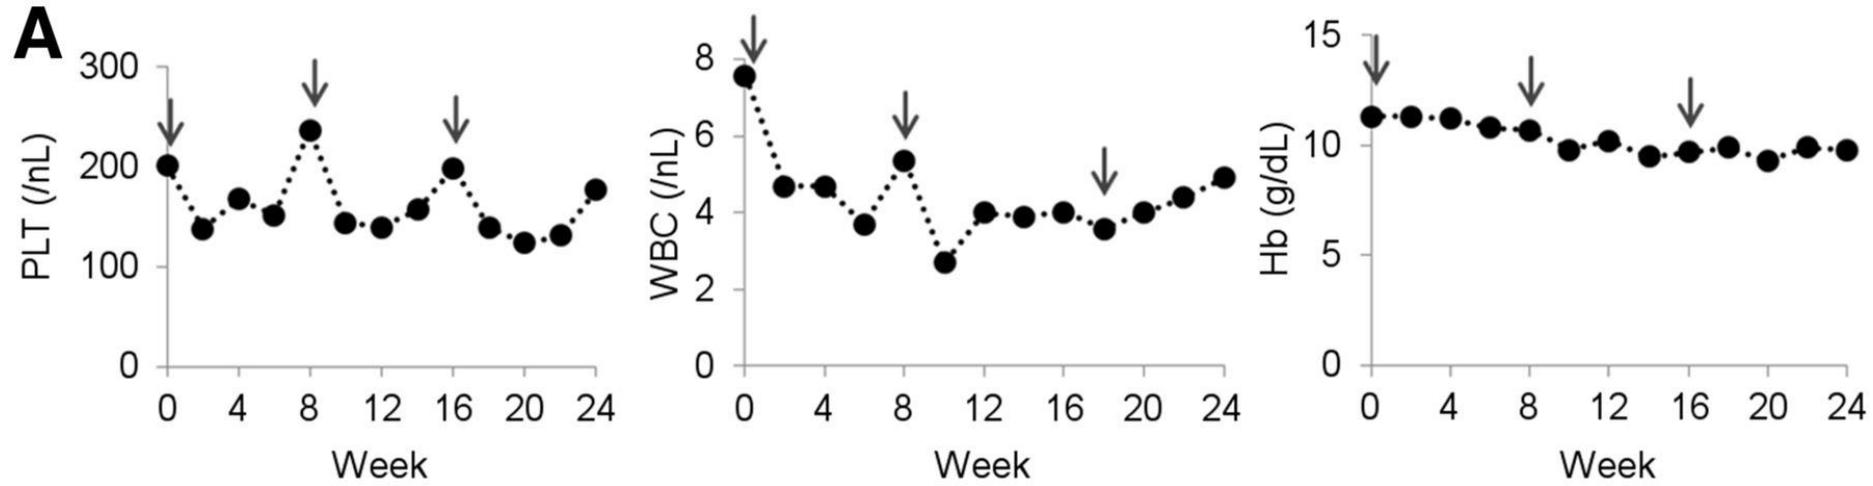

**FIGURE 1.** <sup>68</sup>Ga-PSMA-11 PET/CT scans of patient A. Pretherapeutic tumor spread (A), restaging 2 mo after third cycle of <sup>225</sup>Ac-PSMA-617 (B), and restaging 2 mo after one additional consolidation therapy (C).

**FIGURE 3.** <sup>68</sup>Ga-PSMA-11 PET/CT scans of patient B. In comparison to initial tumor spread (A), restaging after 2 cycles of  $\beta$ -emitting <sup>177</sup>Lu-PSMA-617 presented progression (B). In contrast, restaging after second (C) and third (D) cycles of  $\alpha$ -emitting <sup>225</sup>Ac-PSMA-617 presented impressive response.

## Combined $^{177}\text{Lu}/^{225}\text{Ac}$ imaging for dosimetry

$^{177}\text{Lu}$ : 208 keV, 15% width

$^{225}\text{Ac}$ : 440 keV, 20% width

Scan Time ~ 1h per bed position

Delker A et al. Biodistribution and dosimetry for combined [ $^{177}\text{Lu}$ ]Lu-PSMA-I&T/[ $^{225}\text{Ac}$ ]Ac-PSMA-I&T therapy using multi-isotope quantitative SPECT imaging. *Eur J Nucl Med Mol Imaging*. 2023;50(5):1280-1290.

## [<sup>225</sup>Ac]Ac-PSMA – Clinical Trials (selection)

- AcTION: A Phase I Study of [<sup>225</sup>Ac]Ac-PSMA-617 in Men With PSMA-positive Prostate Cancer With or Without Prior [<sup>177</sup>Lu]Lu-PSMA-617 Radioligand Therapy (NCT04597411)
- LUTACT: Comparison of <sup>177</sup>Lu-PSMA-617 and <sup>225</sup>Ac-PSMA-617 (NCT07054346)
- PAnTHA: First-in-human Study of <sup>225</sup>Ac-PSMA-Trillium (BAY 3563254) in Participants With Advanced Metastatic Castration-resistant Prostate Cancer
- <sup>225</sup>Ac-J591 (nonoclonal antibody)
  - Phase I dose-escalation trial of <sup>225</sup>Ac-J591 in mCRPC patients (NCT03276572)
  - Pilot study of PSMA-targeted radionuclide therapy (TRT) re-treatment utilizing <sup>225</sup>Ac-J591 (NCT04576871)
- ...

# Production Routes of $^{225}\text{Ac}$

- Limited availability constrains the more intensive use of  $^{225}\text{Ac}$
- route for  $^{233}\text{U}$  decay is, at the moment, the only viable way to obtain  $^{229}\text{Th}$ , the parent of  $^{225}\text{Ra}$  and then of  $^{225}\text{Ac}$ 
  - concerns in the use of fissile  $^{233}\text{U}$  (by-products and waste from its decay)
  - extensive purification is needed to get clinically relevant and pharma grade amounts of  $^{225}\text{Ac}$
- Alternative: Cyclotron production of  $^{225}\text{Ac}$  by proton bombardment of  $^{226}\text{Ra}$   
→  $^{226}\text{Ra}(p,2n)^{225}\text{Ac}$

# Availability of $^{225}\text{Ac}$

- Oak Ridge National Laboratory has been supplying 25 ... 30 GBq per year of high-purity  $^{225}\text{Ac}$
- similar quantity is reported to be available from the Institute of Physics and Power Engineering, in Obninsk, Russia
- Institute for Transuranium Elements in Karlsruhe, Germany (ITU) maintains a smaller  $^{229}\text{Th}$  source that is capable of producing 12 ... 15 GBq of  $^{225}\text{Ac}$  per year
- ITM, Eckert & Ziegler → new production facilities based on cyclotron production route

# CURRENT AND FUTURE DEVELOPMENTS TO BE CONSIDERED

# New Therapeutic Targets

Target	Full Name	Indications (Explored)	Radionuclides	Notes
<b>FAPI</b>	Fibroblast Activation Protein inhibitor	Many solid tumors (e.g., pancreatic, breast, lung, sarcoma)	$^{177}\text{Lu}$ , $^{225}\text{Ac}$ , $^{90}\text{Y}$	Targets tumor stroma (CAF-rich tumors); very high uptake and rapid clearance from non-tumor tissue.
<b>GRPr</b>	Gastrin-Releasing Peptide Receptor	Prostate cancer, breast cancer, small cell lung cancer	$^{177}\text{Lu}$ , $^{90}\text{Y}$	Mainly explored in prostate and breast cancers
<b>CXCR4</b>	C-X-C chemokine receptor type 4	Hematological malignancies (e.g., multiple myeloma, AML), some solid tumors	$^{177}\text{Lu}$ , $^{90}\text{Y}$	Important for aggressive and metastatic disease

# Radionuclides used in Therapy + “new“

Radio-nuclide	Type	Energy [MeV]	Gamma Energy used for Imaging [keV]	Half Live [d]
<sup>131</sup> I	$\beta^-$	0,61; Mean: 0,2	364	8,0
<sup>177</sup> Lu		0,5; Mean: 0,1	113; 208	6,6
<sup>90</sup> Y		2,3; Mean 0,9	Bremsstrahlung	2,7
<sup>166</sup> Ho		1,8; Mean:	81	1,1
<sup>188</sup> Re		2,1; Mean: 0,8	155	0,7
<sup>153</sup> Sm		0,8; Mean: 0,2	103	1,9
<sup>89</sup> Sr		1,5; Mean: 0,6	Bremsstrahlung	50,6
<sup>32</sup> P		1,7 ; Mean: 0,7		14,3
<sup>223</sup> Ra	$\alpha$	5...7,5	82	11,4
<sup>225</sup> Ac	$\alpha$	<b>5,8 ... 8,4</b>	<b>441</b>	<b>10</b>
<sup>169</sup> Er	$\beta^-$	0.4; Mean: 1,0	Bremsstrahlung	9,4
<sup>186</sup> Re		1,1; Mean: 0,4	137	3,7
<sup>211</sup> At	$\alpha$	5,8 ... 7.5		0.29
<sup>161</sup> Tb	$\beta^-$	<b>0,59 ; Mean: 0,15 (Auger Electrons)</b>	<b>49; 75</b>	<b>6,96</b>
<sup>212</sup> Pb	$\beta^-, \alpha$	0,57 ; Mean: 0,14 ( $\alpha$ : 2,2; 6,2)	<sup>212</sup> Bi: 230, 247	0,43
<sup>67</sup> Cu	$\beta^-$	0,56 ; Mean: 0,14	93, 185	2,6

# „NEW RADIONUCLIDE“ – TERBIUM-161

## Targeted Radionuclide Therapy: $^{177}\text{Lu}$ & $^{161}\text{Tb}$

- Lu-177: Standard  $\beta^-$  emitter with gamma photons  
→ established clinical role
- Tb-161: Next-generation  $\beta^-$  emitter + conversion/Auger electrons  
→ enhanced DNA-level damage potential
- Shared trait: Both chelate well with DOTA  
→ same ligands can be used (DOTATATE, PSMA, etc.)

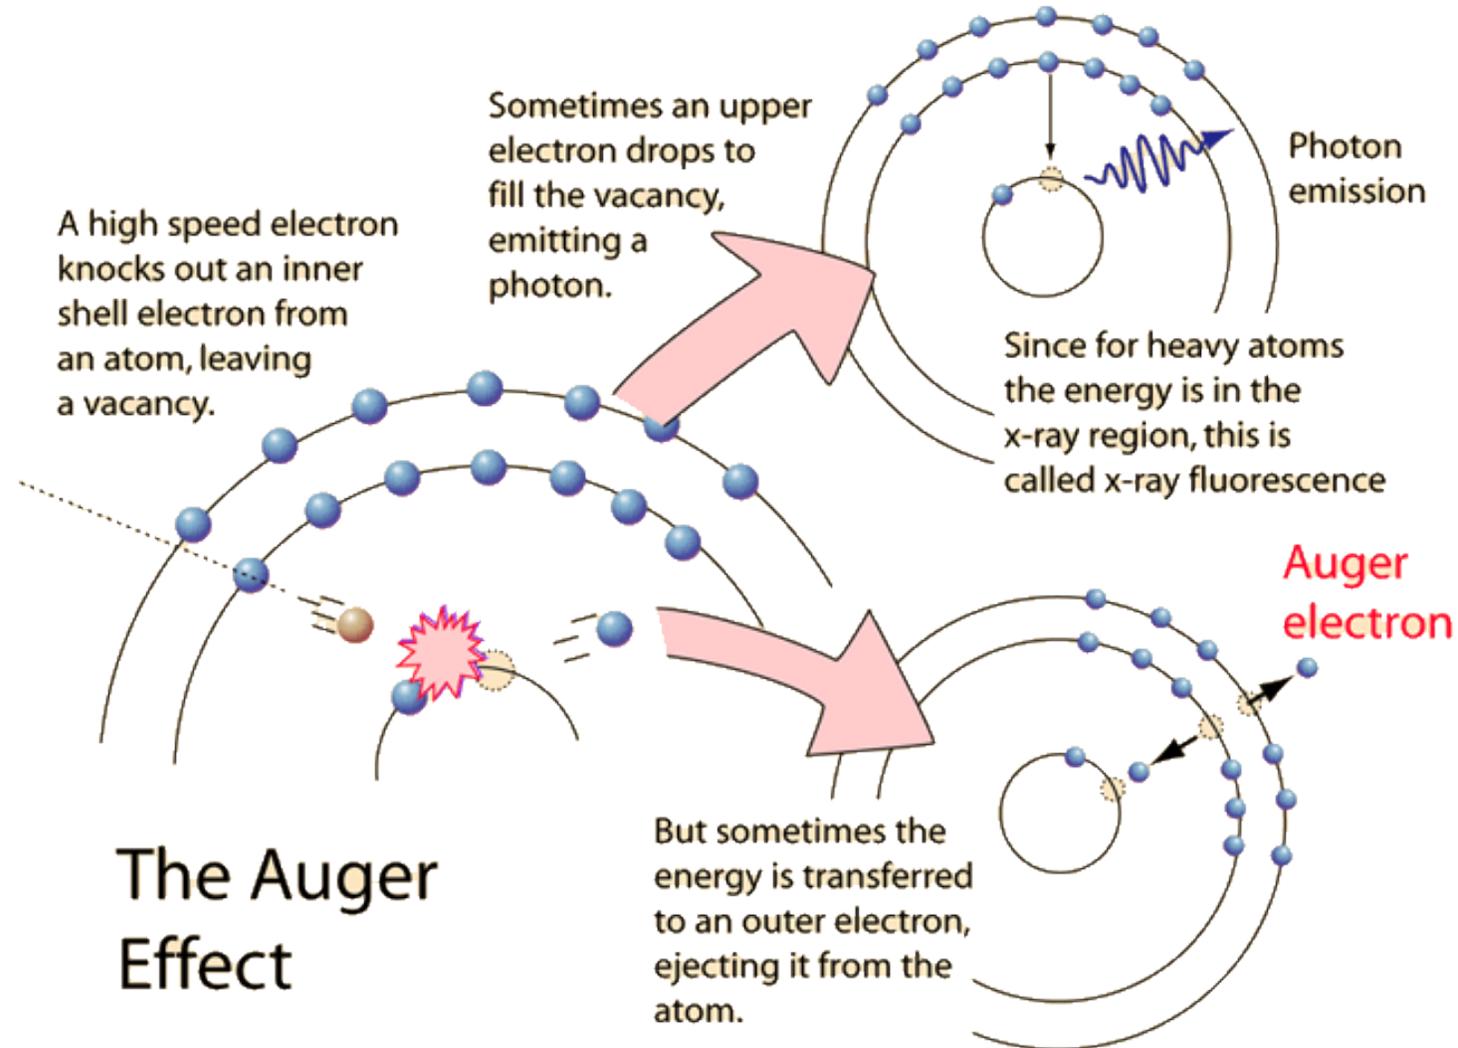

# Auger Emitters – Precision Tools for Targeted Radiotherapy

## Mechanism

- Radionuclide decays → inner-shell vacancy
- Cascade of Auger electron emissions
- Energy deposition localized around the atom → DNA damage if near nucleus

## Physical Characteristics

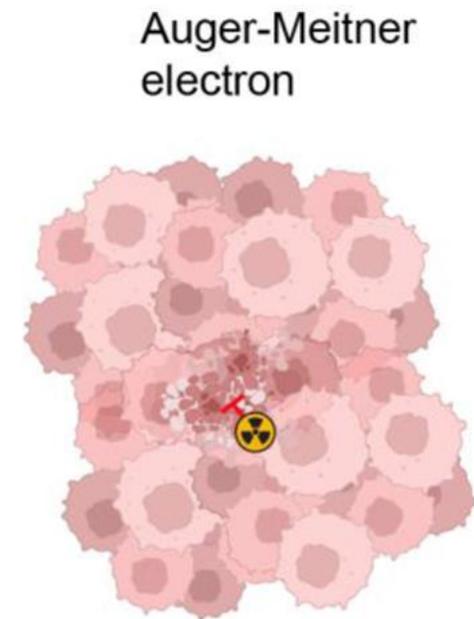

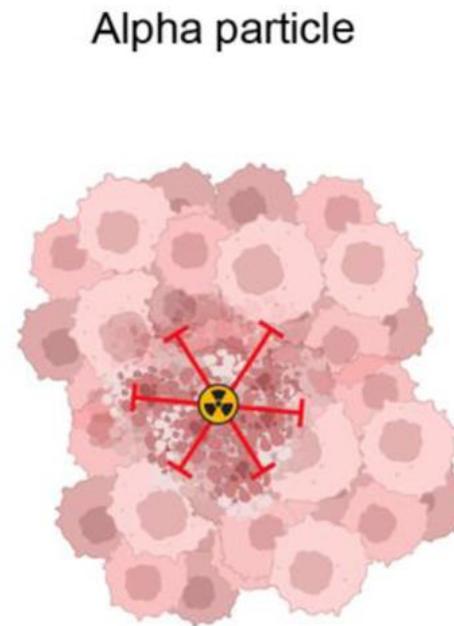

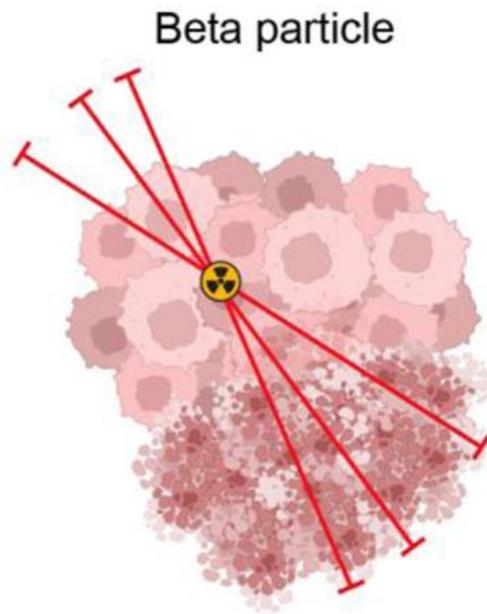

Property	Typical Value
Energy	20 eV – 25 keV
Range in tissue	1 – 10 nm
LET	up to 30 keV/μm
Target scale	DNA / nucleus

<http://hyperphysics.phy-astr.gsu.edu/hbase/Atomic/auger.html>

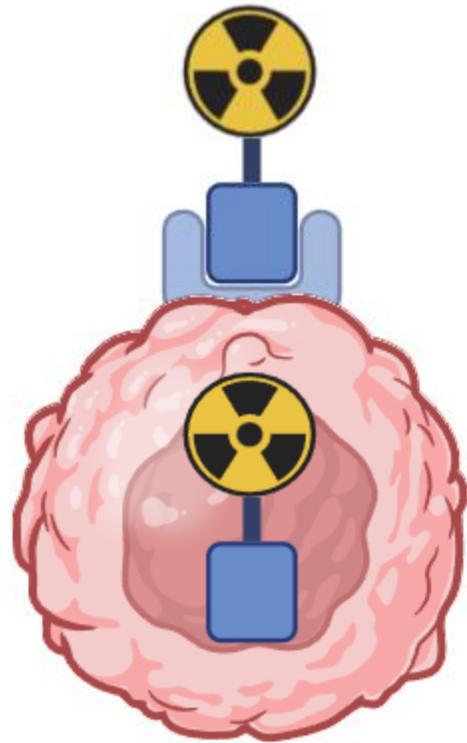

# Therapeutic Radionuclides – A Question of Range

	Beta particle	Alpha particle	Auger-Meitner electron
<i>Scale</i>	tumors, tissues	< 10 cells	single cell
<i>Range</i>	0.1-10 mm	< 100 $\mu\text{m}$	< 1 $\mu\text{m}$
<i>LET</i>	<1 keV/ $\mu\text{m}$	50 - 230 keV/ $\mu\text{m}$	1 - 23 keV/ $\mu\text{m}$
<i>Example nuclides</i>	$^{177}\text{Lu}$ , $^{90}\text{Y}$ , $^{153}\text{Sm}$ , $^{131}\text{I}$	$^{223}\text{Ra}$ , $^{225}\text{Ac}$ , $^{212}\text{Pb}$	$^{123}\text{I}$ , $^{111}\text{In}$
<i>Example agents</i>	$^{177}\text{Lu}$ ]Lu-dotatate (Lutathera®) $^{177}\text{Lu}$ ]Lu-PSMA-617 (Pluvicto™)	$^{223}\text{Ra}$ ]RaCl <sub>2</sub> (Xofigo®)	$^{161}\text{Tb}$ - labelled pharmaceuticals

binds to CAF

# Lu-177 vs Tb-161

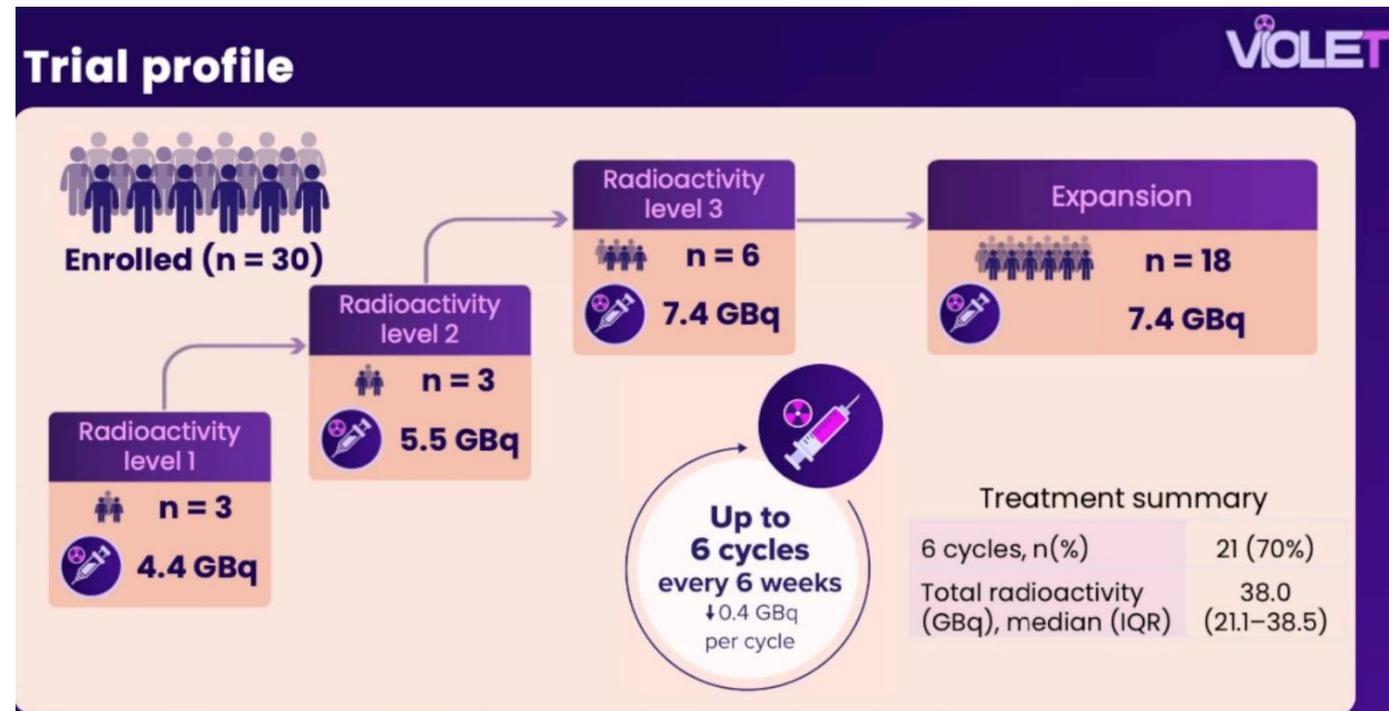

<b>Property</b>	<b>Lu-177</b>	<b>Tb-161</b>	<b>Key Takeaway</b>
<b>Half-life</b>	~6.65 days	~6.89 days	Nearly identical → same logistics
<b>β<sup>-</sup> energy</b>	E <sub>max</sub> ~0.497 MeV (mean ~0.133 MeV)	E <sub>max</sub> ~0.593 MeV (mean ~0.154 MeV)	Very similar tissue penetration (~1–2 mm)
<b>Additional radiation</b>	Minimal Auger/IC	High yield of conversion & Auger e <sup>-</sup> (nm–μm range)	Extra DNA-level damage when ligand internalizes
<b>Gamma emissions</b>	113 keV (6.4%) 208 keV (11%)	49–103 keV (several low-energy γ lines)	Both allow SPECT imaging; Tb-161 lower energy
<b>Chemistry</b>	Lanthanide; stable DOTA chelation	Same; DOTA compatible	Ligands interchangeable (DOTATATE, PSMA, etc.)

## Where They Are Used

- Lu-177 Today
  - Approved:
    - Neuroendocrine tumors → Lu-177-DOTATATE (PRRT)
    - Prostate cancer (PSMA+ mCRPC) → Lu-177-PSMA-617 (Pluvicto)
  - Proven OS and PFS improvements in pivotal trials.
- Tb-161 Tomorrow
  - Still investigational, early trials in NETs and prostate cancer
  - Strong preclinical evidence of higher tumor kill, especially micro-metastases
  - First-in-human studies (PSMA-I&T) show feasibility and safety.

# VIOLET trial

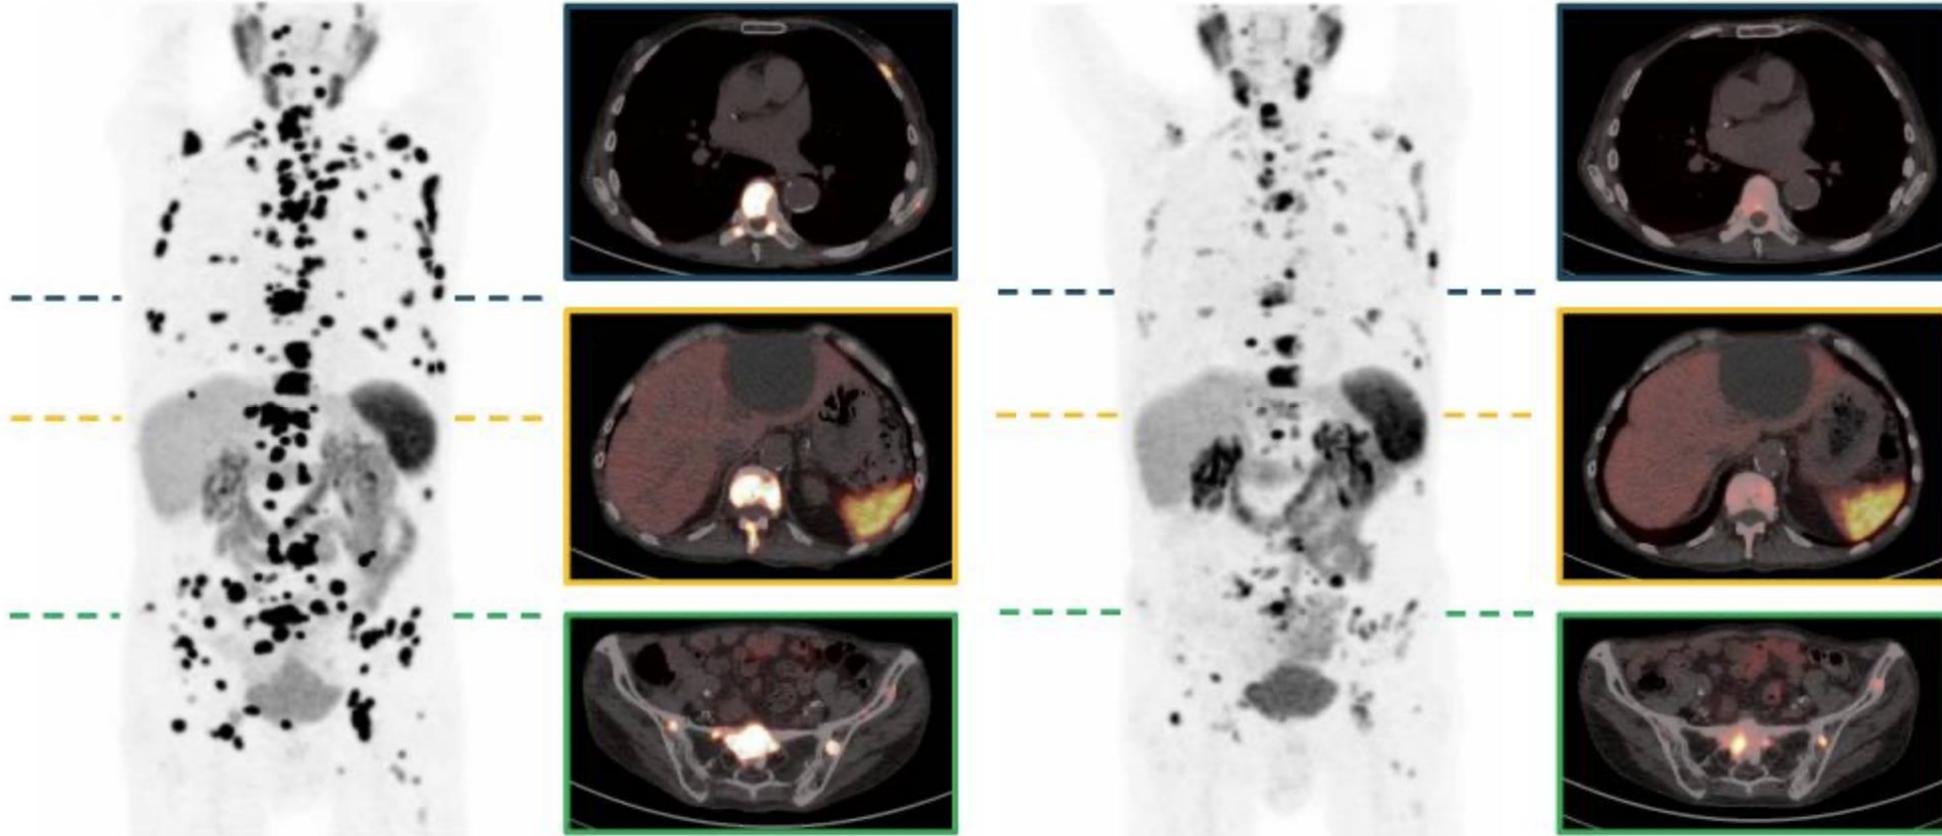

- VIOLET trial (led by P. Mac CC) uses [ $^{161}\text{Tb}$ ]Tb-PSMA-I&T to treat patients with metastatic castration-resistant prostate cancer
- Initial results from the phase I/II study have shown great promise:
  - 70% of patients had their PSA levels decline by 50% or more
  - 40% of patients experienced an even more significant PSA decline of 90% or more
  - treatment was well-tolerated with low rates of side effects

# Response

Prior [<sup>161</sup>Tb]Tb-PSMA-617 RLT

after 2 cycles of [<sup>161</sup>Tb]Tb-PSMA-617 RLT

PSA: 185 ng/mL

TLP: 5162 SUV x mL

PSA: 6.56 ng/mL

TLP: 1465 SUV x mL

Rosar F et al. "Pilot experience of [<sup>161</sup>Tb]Tb-PSMA-617 RLT in mCRPC patients after conventional PSMA RLT within a prospective registry." *Theranostics* vol. 15,17 9019-9028. 16 Aug. 2025, doi:10.7150/thno.115831
