# Basic Nuclear Fission Concepts

## Nuclear Fission

# Binding Energy and Mass Defect

# Fission Reaction Energy

$$\Delta m = 235.044 + 1.009 - (140.914 + 91.926 + 3 \times 1.009) = 0.186 \text{ amu}$$

$$1u = 931.5 \text{ MeV}$$

$$E = \Delta mc^2 = 0.1927 \times 931.5 = 173.3 \text{ MeV}$$

Photons (in the form of gamma rays) are also produced in addition to released energy.  
Therefore, average energy of fission reaction U-235 is about **203 MeV**

Otto Hahn and  
Lise Meitner  
1913

# Neutron Induced Nuclear Fission in Heavy Nuclei

## Fissile:

Nuclides that can be induced to fission with high probability by thermal neutrons are referred to as **fissile**

## Fissionable:

Fissile Nuclides and those that fission when induced by fast neutrons are referred to as **fissionable**

Microscopic cross sections  
(probability of neutrons inducing fission)

## Fertile

Nuclides from which fissile material is generated by neutron absorption and subsequent nuclei conversions

# Neutron Induced Nuclear Fission in Heavy Nuclei

Neutrons created after fission are fast neutrons (high energy)

Microscopic cross sections  
(probability of neutrons inducing fission)

Thermal fission requires slow 'thermal' neutrons (0.025 eV, 2km/s) → needs moderator (light nuclei) required to slow fast neutrons

Fast fission requires fast neutrons (1 MeV, 14000km/s) → moderator must be excluded

**Thermal Nuclear Reactors**

**Fast Nuclear Reactors**

# Innovative Nuclear Reactors and Gen-IV Concepts

- Fission Basics
- A bit of History
  - Nuclear Reactor Terminology
  - Classification
  - WCR: Water Cooled Reactors
- Innovative Nuclear Reactors
  - SWCR: Super Critical Water Cooled Reactor
  - HTGR: High Temperature Gas cooled Reactor
  - GFR: Gas cooled Fast Reactor
  - SFR: Sodium cooled Fast Reactor
  - LFR: Lead (and LBE) cooled Fast Reactor
  - MSR: Molten Salt Cooled Reactor
  - SMR: Small Modular Reactor

# Classification of Nuclear Fission Reactors

- Moderator

- Water / Heavy Water
- Graphite
- None (fast neutron systems)

- Coolant

- Water/Heavy Water
- Liquid Metal
  - Sodium/Lead/Lead-Bismuth Eutectic (LBE)
- Gas
  - Air
  - CO<sub>2</sub>
  - He
- Molten Salt
  - Fluoride
  - Chloride

- Fuel

- UO<sub>2</sub>
- MOX (UO<sub>2</sub> + PuO<sub>2</sub>)
- Metallic
- U/Pu Nitride
- U/Pu Carbide
- Molten Salt

- Purpose

- Electricity Generation
- Non-Electric Application
  - District Heating
  - Water Desalination
  - Industrial Purposes
  - H<sub>2</sub> Production

- Power

- Low/Middle/High

# Nuclear Power Reactor Classifications

MOX is a mixed-oxide containing any combination of U, Pu and Th.

# Evolution of Nuclear Power Reactor Technology

# Major Features of WCRs

- Water Cooled & Moderated
  - Water used to remove heat from nuclear fission in the fuel
    - Long history using water; first steam engine developed by Egyptian mathematician in Alexandria
  - Neutrons are slowed down, which improves controllability of fission chain reaction
- If High Pressures
  - Achieve high energy content
  - Require pressure vessel, and containment

Fission in fuel

# PWR Technology

## Plant operation:

- **Most common** thermal reactor technology
- **Moderator: light water**  
Important safety feature: increase in temperature causes water to “expand” reducing probability of neutron thermalization which reduces new fissions thus reducing reactivity (called negative temperature coefficient of reactivity)
- **Coolant: light water**  
Primary loop: coolant is under  $\sim 15.5\text{MPa}$  (water remains liquid despite high temperature)

**Fuel pellet  
(enriched  $\text{UO}_2$ )**

**Fuel  
assembly**

**Reactor core**

# BWR Technology

**Fuel assembly &  
Cruciform control rods**

- Second most common power reactor type
- Water: coolant & moderator
- Fission generates heat that causes cooling water to boil producing steam
- Steam from the reactor drives the turbines directly: direct-cycle
- Cooling water is at low pressure,  $\sim 7.6$  MPa (it boils in the core at  $\sim 285^{\circ}\text{C}$ )

# Pressurized Heavy Water Reactor (PHWR)

- Better neutron economy
- On-line refuelling

- Moderator: heavy water ( $D_2O$ ) →
- Fuel: natural uranium (no enrichment)
- Pressure-tube design: pressure tubes within the calandria (380 – 480 tubes assembles a reactor)

...also known as CANDU

The CANDU Bruce Nuclear Generating Station is the largest nuclear power plant in the world by net operating capacity

Qinshan Phase III units 1 & 2, located in Zhejiang China (30.436 N 120.958 E): Two CANDU 6 reactors, designed by Atomic Energy of Canada Limited (AECL), owned and operated by the Third Qinshan Nuclear Power Company Limited

# WCR Fuel Assemblies (Rod Bundles)

**RBMK**

**PWR**

**VVER**

**CANDU**

**BWR**

# Fuel Assembly Types

Control Rod S/A

**Different Scales!**

  - SMR: Small Modular Reactor

# Water Cooled Reactors: Why are we unsatisfied?

|               | WCR                                     |
|---------------|-----------------------------------------|
| coolant       | $\text{H}_2\text{O}/\text{D}_2\text{O}$ |
| outlet T, C   | 288-329                                 |
| efficiency, % | 35                                      |
| max P, MPa    | 7-17                                    |
| spectrum      | thermal                                 |

- *Mature Technology*
- *Low  $T \Rightarrow$  Low Efficiency*
- *High Pressure  $\Rightarrow$  safety issues*
- *Only thermal spectrum  $\Rightarrow$  not sustainable*

# Innovative Reactors (Gen-IV)

## Innovative Reactor:

Advanced design which incorporates conceptual changes in design approaches or system configuration in comparison with existing practice. Substantial R&D, feasibility tests, and possibly a prototype or demonstration reactor are required prior to deployment.

- **Early Prototypes and Demonstration Plants Gen-I**
- **Current Fleet Gen-II/III**
- **Advanced Nuclear Reactors**

- *Evolutionary designs*  
Gen-III and Gen-III+
- *Innovative designs*  
Gen-IV
- SMRs can be either *evolutionary* or *innovative*
- *Innovative SMR*

## Advanced Modular Reactor (AMR)

Sodium cooled Fast Reactor (SFR)

Lead cooled Fast Reactor (LFR)

Very-High-Temperature Reactor (VHTR)

Supercritical Water cooled Reactor (SCWR)

Gas cooled Fast Reactor (GFR)

Molten Salt Reactor (MSR)

# GIF: Goals for Gen-IV Nuclear Energy Systems

|                                                         |                                                                                                                                                                                                                                                         |
|---------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Sustainability-1</b>                                 | Generation IV nuclear energy systems will provide sustainable energy generation that meets clean air objectives and provides long-term availability of systems and effective fuel utilisation for worldwide energy production.                          |
| <b>Sustainability-2</b>                                 | Generation IV nuclear energy systems will minimise and manage their nuclear waste and notably reduce the long-term stewardship burden, thereby improving protection for the public health and the environment.                                          |
| <b>Economics-1</b>                                      | Generation IV nuclear energy systems will have a clear life-cycle cost advantage over other energy sources.                                                                                                                                             |
| <b>Economics-2</b>                                      | Generation IV nuclear energy systems will have a level of financial risk comparable to other energy projects.                                                                                                                                           |
| <b>Safety and Reliability-1</b>                         | Generation IV nuclear energy systems operations will excel in safety and reliability.                                                                                                                                                                   |
| <b>Safety and Reliability-2</b>                         | Generation IV nuclear energy systems will have a very low likelihood and degree of reactor core damage.                                                                                                                                                 |
| <b>Safety and Reliability-3</b>                         | Generation IV nuclear energy systems will eliminate the need for offsite emergency response.                                                                                                                                                            |
| <b>Proliferation Resistance and Physical Protection</b> | Generation IV nuclear energy systems will increase the assurance that they are very unattractive and the least desirable route for diversion or theft of weapons-usable materials, and provide increased physical protection against acts of terrorism. |

# Thermal vs. Fast Neutron Reactors: Sustainability?

Two main Isotopes in Natural Uranium:

*fissile*  $^{235}\text{U}$  0.7%  
*fertile*  $^{238}\text{U}$  99.3%

|                                        | Thermal Reactor                                     | Fast Reactor                                                      |
|----------------------------------------|-----------------------------------------------------|-------------------------------------------------------------------|
| fuel efficiency (sustainability-1)     | less 1% of natural U used                           | can utilize 60 times more U                                       |
| waste production (sustainability-2)    | significant amounts of long-lived radioactive waste | potentially less waste; burnup of long-lived isotopes is possible |
| enrichment                             | <3-5%                                               | 15-100% (20% ref.)                                                |
| proliferation issues                   | easier                                              | more problems as it require closing the fuel cycle                |
| coolant                                | H <sub>2</sub> O                                    | water is not possible                                             |
| neutron flux density (material damage) | $10^{13} - 10^{14}$ n/cm <sup>2</sup> /s            | $10^{14} - 10^{15}$ n/cm <sup>2</sup> /s                          |
| compatibility of structural materials  | long experience                                     | needs qualifications                                              |
| technology readiness                   | mature technology                                   | pong experience with Na coolant but not with others               |
| Safety                                 | Well-established but...                             | to be proven                                                      |

# Super-Critical Water-cooled Reactors (SCWR)

|               | WCR              | SCWR             |
|---------------|------------------|------------------|
| coolant       | H <sub>2</sub> O | H <sub>2</sub> O |
| outlet T, C   | 288-329          | 500              |
| efficiency, % | 35               | 45               |
| max P, MPa    | 17               | 25               |
| spectrum      | thermal          | thermal/fast     |

- Use water above critical point (22.12MPa and 647.14 K) as coolant.
- The high outlet temperature increases efficiency
- Potential for fast neutron spectrum in some designs.
- High Pressure -> increased costs for ensuring safety.
- Known technology for gas and coal plants but no experience in nuclear reactors.

# Gas cooled Reactors (HTGR - VHTR, GFR)

|               | WCR              | SCWR             | HTGR    | GFR  |
|---------------|------------------|------------------|---------|------|
| coolant       | H <sub>2</sub> O | H <sub>2</sub> O | He      | He   |
| outlet T, C   | 288-329          | 500              | 750     | 750  |
| efficiency, % | 35               | 45               | 50      | 50   |
| max P, MPa    | 17               | 25               | 7       | 7    |
| spectrum      | thermal          | thermal/fast     | thermal | fast |

- The high temperatures and direct cycle increase efficiency
- The high temperature enables non-electric industrial applications
- Extended experience in gas and coal power plants but **limited experience in nuclear**
- GFR design allows for fast spectrum
- *Low Voiding Reactivity*

# Sodium cooled Fast Reactors

|               | WCR              | SCWR             | HTGR    | GFR  | SFR  |
|---------------|------------------|------------------|---------|------|------|
| coolant       | H <sub>2</sub> O | H <sub>2</sub> O | He      | He   | Na   |
| outlet T, C   | 288-329          | 500              | 750     | 750  | 550  |
| efficiency, % | 35               | 45               | 50      | 50   | 45   |
| max P, MPa    | 17               | 25               | 7       | 7    | ~0.2 |
| spectrum      | thermal          | thermal/fast     | thermal | fast | fast |

## EBR-I 1951

- *High coolant T => High Efficiency*
- *Low Pressure*
- *Mature Technology*
- *Fast spectrum*
- *Sodium violently reacts with water and air*

# Experimental Breeder Reactor (EBR-I)

(First Ever Electricity Generated from Nuclear Reactor)

- First ever **liquid metal cooled fast reactor** built by Argonne National Laboratory (ANL) – West (now Idaho National Laboratory (INL))
- The primary purpose of EBR-I is to demonstrate **breeding** of fissile material
- Coolant: NaK Eutectic Alloy
- Fuel: Metallic Uranium

- On 20 December, 1951, EBR-I generated first **usable electricity** to power four light bulbs
- Later, EBR-I continued to supply 200 kW to power its own building. Reactor operated for **12 years** before its final shutdown in 1953

# Fast Reactors in Operation & under Commissioning

**BN-600,**  
Russia, 1980

**CEFR, 20 MW(e)**  
China, 2011

**BN-800**  
Russia, 2015

# SFR: Existing Fleet > Evolutionary > Innovative

BN-600 >>> BN-800

Similar:

- sodium circuits design
- Basic safety systems
- I&C systems including
  - reactor monitoring systems

New:

- safety systems
  - including passive: hydraulically suspended control rods
- numerous other improvements

BN-800 >>> BN-1200

- Proven technologies based on BN-600/800 experience
- Safety: accidents that require public evacuation are practically eliminated
  - Additional passive high temperature actuated control rods system
- Fuel: uranium-plutonium nitride
- Lower power density
- Passive DHR systems
- Competitive with other advanced nuclear power plants and with power plants using fossil fuel

## Conceptual design of CiFR1000

CiFR1000 is composed of several fast reactors and one fuel regeneration facility in same plant site. Fuel regeneration facility integrate pyro-processing and metal fuel fabrication line for fuel reprocessing and regeneration.

| Parameter                          | Value                  |
|------------------------------------|------------------------|

- *Compatibility of Materials*

# NATRIUM: SFR with Molten Salt Storage System

Designed by Terrapower

- 345 MW(e) SFR combined with
- 1GW(th) Energy molten salt-based storage system
- Pick power can boost to 500 MW(e)
- Can be used for non-electrical applications
- Can work with renewables

# Comparing Innovative Reactor Concepts

1) CMI: Coolant – structural Materials Interaction

# Thorium Fuel Cycle

$^{232}\text{Th} \gg ^{233}\text{U}$ : Th Cycle can operate in thermal spectrum

Absorption of neutrons by  $^{232}\text{Th}$  initiates the series of transformations leading to the production of fissile  $^{233}\text{U}$  that is by far the best 'fissile' isotope for thermal neutron spectrum and can be used for breeding in both thermal and fast reactors.

See IAEA e-Learning Module on Thorium-Cycle-Based Reactors

# Small Modular Reactors

**Advanced Reactors** that produce typically **up to 300 MWe**, built in factories and transported as **Modules** to sites for installation as demand arises.

**LARGE, CONVENTIONAL REACTOR**  
700+ MW(e)

**SMALL MODULAR REACTOR**  
Up to 300 MW(e)

**MICROREACTOR**  
Up to ~10 MW(e)

**Small:** in size, compared to traditional reactors.

**Modular:** factory-manufactured, installed onsite.

**Reactor:** energy generation via nuclear fission.

# How much clean energy do we need?

Now, this question is different from the previous one

IEA's Stated Policies Scenario: World Energy by Source (IEA, 2021)

World Energy (EJ)

Biomass

Renewables

Nuclear

Gas

Oil

Coal

Fossil Fuels

Are SMRs ready to deliver this amount of energy?

If yes, then how?

# Understanding Product: AAA Batteries

|                 |                                            |
|-----------------|--------------------------------------------|
| Nominal voltage | 1.5 V                                      |
| Impedance       | 156 m-ohm @ 1 kHz                          |
| Typical weight  | 11 g (0.4 oz)                              |
| Typical volume  | 3.5 cm <sup>3</sup> (0.2 in <sup>3</sup> ) |

Coppertop AAA - Constant Current

- Nominal Voltage: 1.5 V
- Battery capacity: 1200 mAh
- Energy capacity:  $1.5 \times 1200 = 1800 \text{ mWh} = 1.8 \text{ Wh}$
- Cost of 1 battery < \$1
- Cost per kWh =  $1/1.8 \sim \$550 / \text{kWh}!!$

<https://batteryspecialties.com/batteries/Duracell/MN2400BK/MN2400BK-CS1190>

- But we still use it. Why?
  - *It is a product designed for the right market. If we look only at the cost as a metric, we will never use a AAA battery*

# Deployment and Development Status in Brief (1/3)

## In operation

### *Floating NPP "Akademik Lomonosov"*

- Russian Federation
- 2 units of KLT-40S (PWR), 35 MW(e) per unit
- Commercial operation started May 2020, first fuel cycle completed

### *HTR-PM*

- China
- 2 units of high temperature gas cooled reactor pebbled-bed module, 200 MW(e) generated from single Turbine Island
- Operation started in 2023

## Under construction

### *ACP100*

- China
- Integral PWR, 125 MW(e)
- Operation expected in 2026

### *BREST-OD-300*

- Russian Federation
- Lead-cooled fast reactor, 300 MW(e)
- Operation expected in 2026

### *CAREM*

- Argentina
- Integral PWR, 32 MW(e)

# Non-Electric Applications

The nature of the industrial heat market is highly fragmented, and therefore suitable for SMRs

50% of the users for industrial processes  
require less than 10 MWth  
40% require 10 -50 MWth  
99% included in the 1 to 300 MWth range

Small emergency preparedness zone (EPZ)  
Provides to locate SMRs close to end-users

## Interest in non-el applications

| Country | Organization                     | Applications                                |
|---------|----------------------------------|---------------------------------------------|
| China   | Bauwu                            | Hydrogen for steel production               |
| Italy   | Federacciai                      | Steel production                            |
| Japan   | Nippon Steel                     | Hydrogen for steel production               |
| Jordan  | Jordan Atomic Energy Commission  | Desalination                                |
| Korea   | Nuclear Heat Utilization Council | Process heat, Hydrogen for steel production |
| Poland  | Synthos Chemical Group           | Hydrogen production                         |
| USA     | Dow Chemicals                    | Process heat                                |

# Advanced Reactors Information System (ARIS)

Web accessible database and a tool for Member States at various stages of nuclear power development, offering standardized, impartial data on reactor designs, including evolutionary and innovative concepts, to support informed reactor technology assessments
