RegCM4.5.0

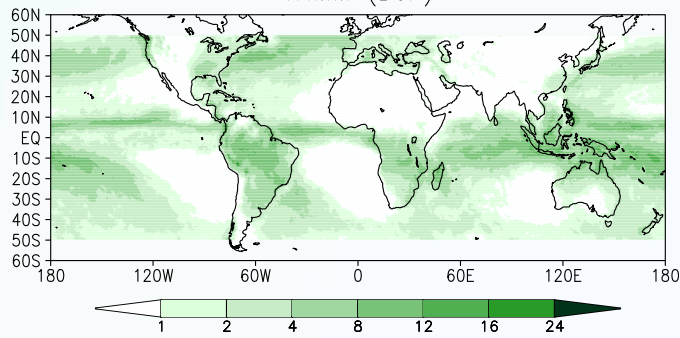

Take home messages

- The model is always changing. It is always impossible to reproduce identical results with an old setting and new model version, but you should be able to “recognize” the model behavior.
- To be able to tune a specific domain it is good to start with a low resolution and try to optimize the schemes before wasting time with a very high resolution setting.
- The same scheme can work in a different way when you change the domain, but the parameters of the scheme are working in the same way
- It is always safer to change one scheme and one parameter of the scheme per time, to fully understand the right direction.
