

# Effects of surface geology on the ground motion

Fabian Bonilla  
(fabian.bonilla@ifsttar.fr)

Université Paris Est - IFSTTAR

# Outline

- What I would like to show:
  - i. Uncertainties of ground motion prediction
  - ii. Why do we have site effects? An overview
  - iii. What field and laboratory data say about linear and nonlinear wave propagation?
  - iv. Borehole seismology: advantages and problems
  - v. Monitoring site properties using strong motion data
- NOAH (NOnlinear Anelastic and Hysteretic code) to simulate wave propagation in 1D linear and nonlinear media:  
<https://dl.ipgp.fr/f54afw4>
- If time allows I have examples about site characterization and broadband strong motion prediction (0-50 Hz) using noise techniques
