## AGENDA

- Overview of the concept
- Documents and guideline
- Evolution of the equipment and of the QA programs
- Doubts and questions
- Today, I will not provide methods for QA and specific tests... you can find multiple way for QA
- ....look into the problems!

## IDENTIFY OR PREVENT SOURCE OF ERRORS?

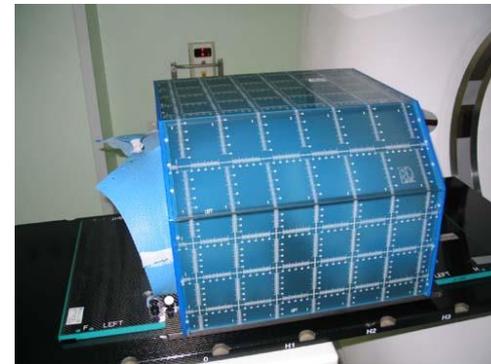

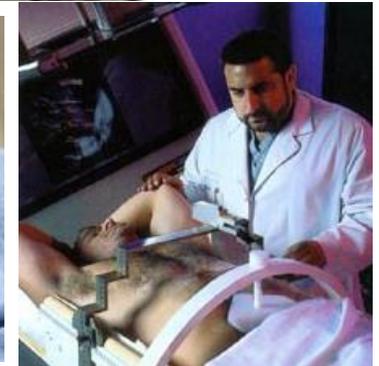

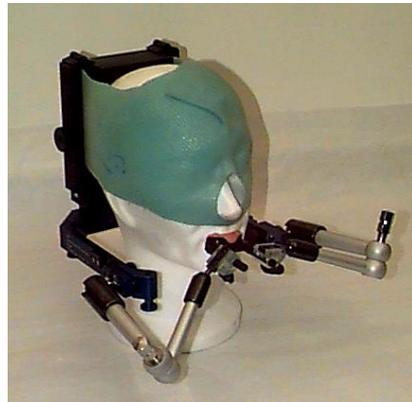

Look for:  
Small or big errors?  
Rare or frequent errors?  
Random or systematic errors?  
Unpredictable or newly errors?

To be accurate once a year (annual QA)  
or to be adequate everyday (Daily QA)?:

# IMMOBILIZATION DEVICE...QA OR NOT QA? LINAC COMPLIANT OR NOT?

## ..... IN PRACTICE? «UMARELL CONCEPT»

*Expert Brainstorming- Multiple-criteria decision*

*Decision Maker*

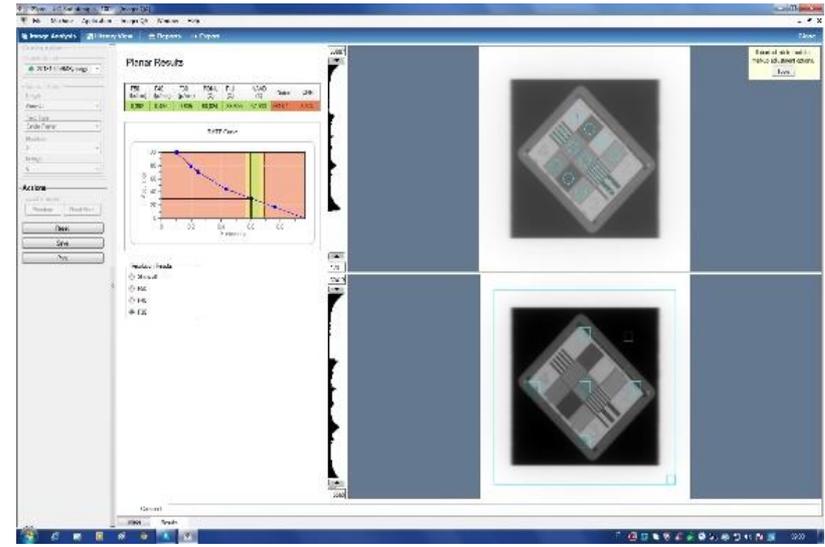

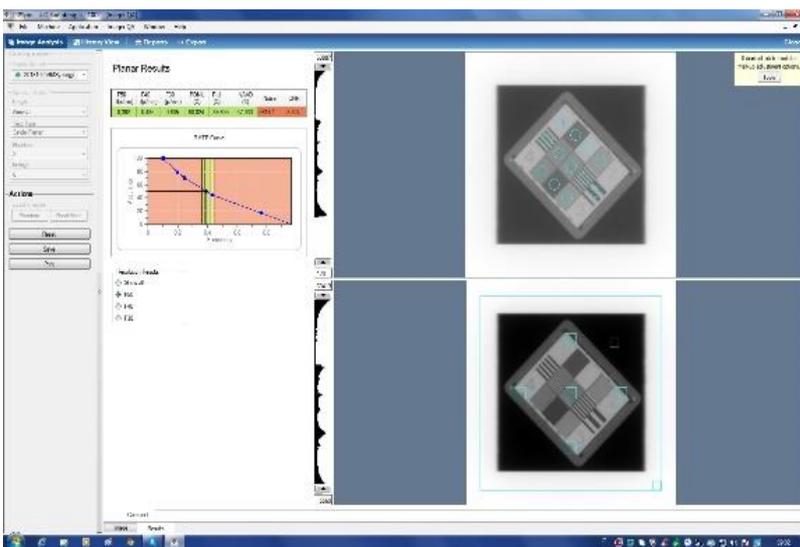

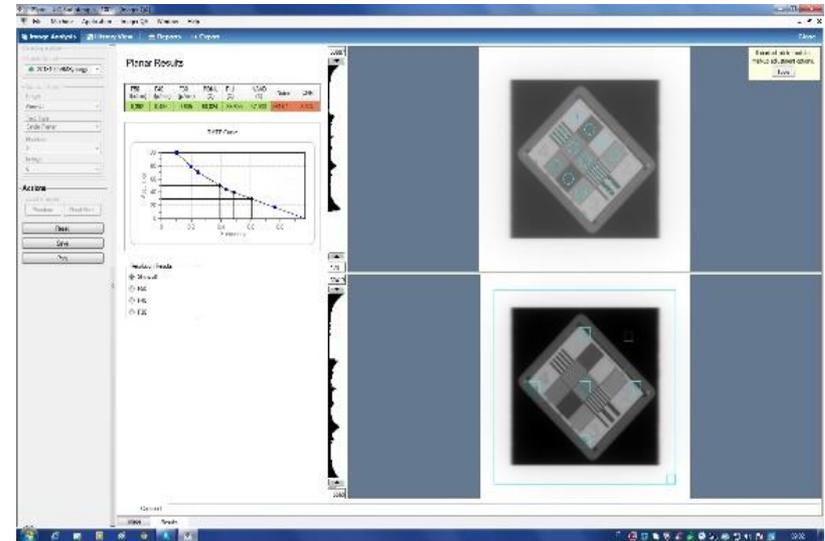

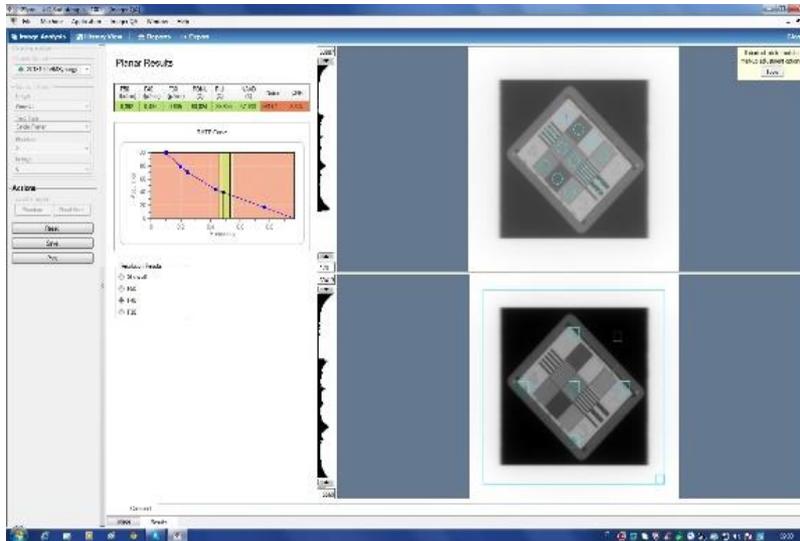

*Wrong Workflow or Healthcare Model – Error investigation*

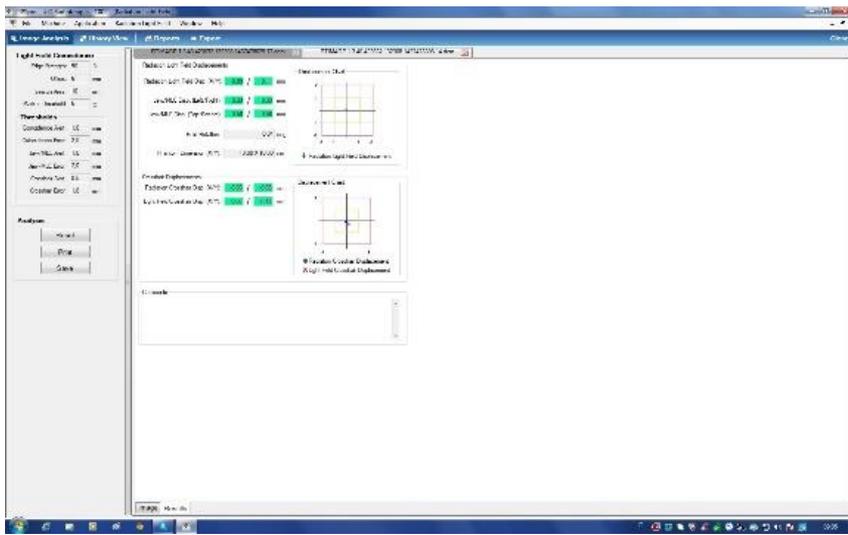

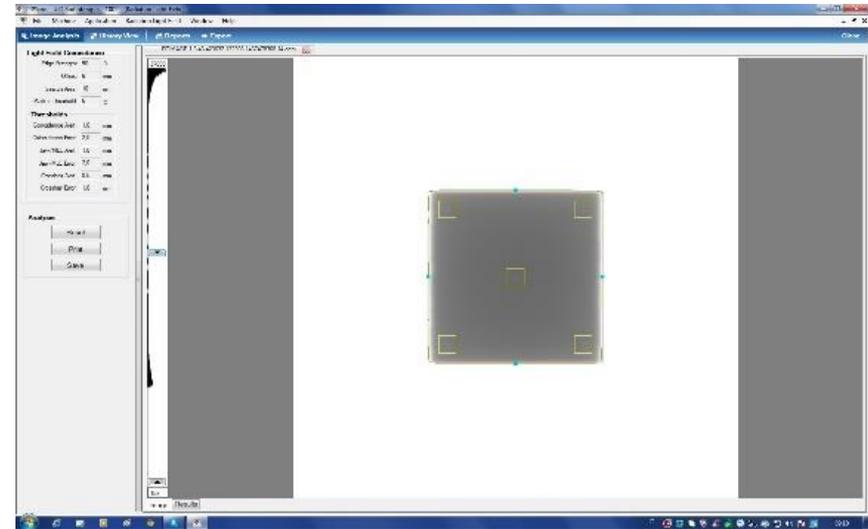

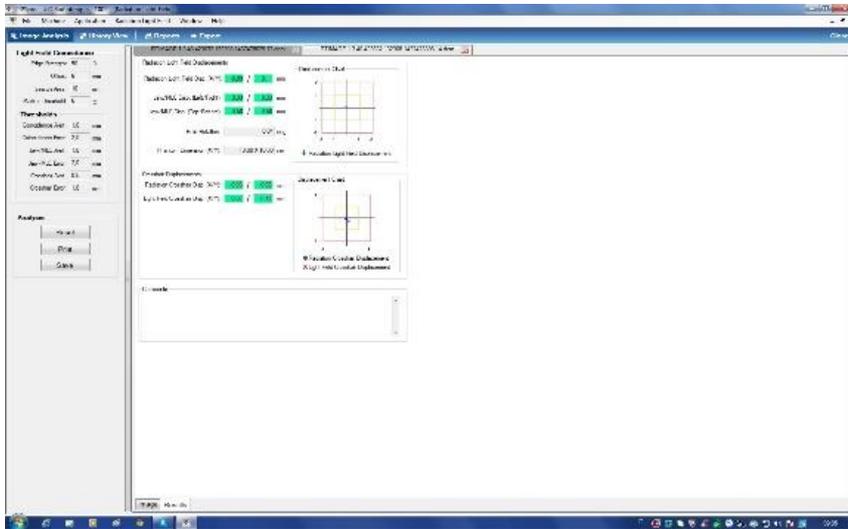

*Results: Simplify and prevent accident*

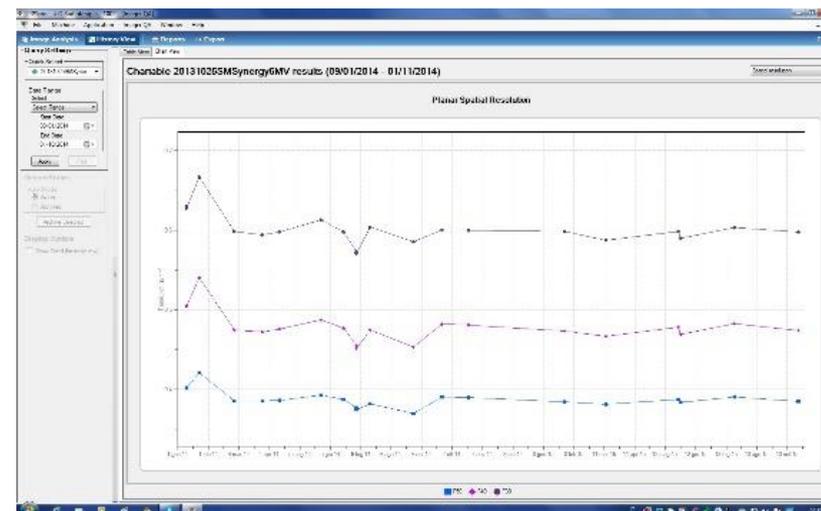

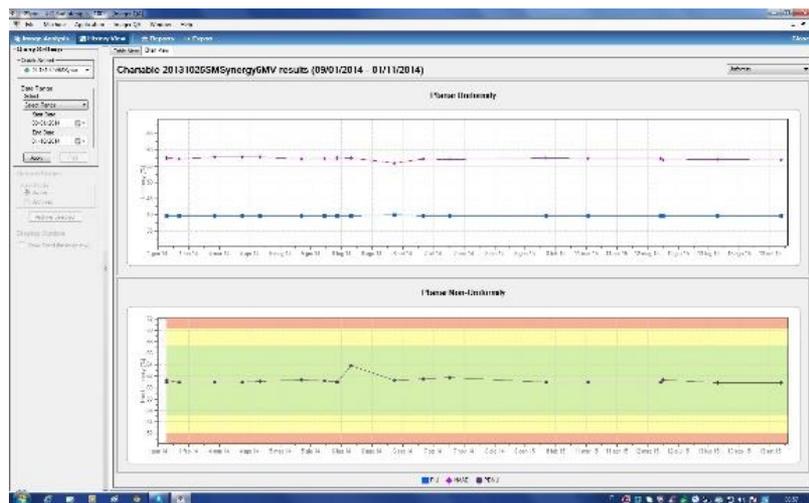

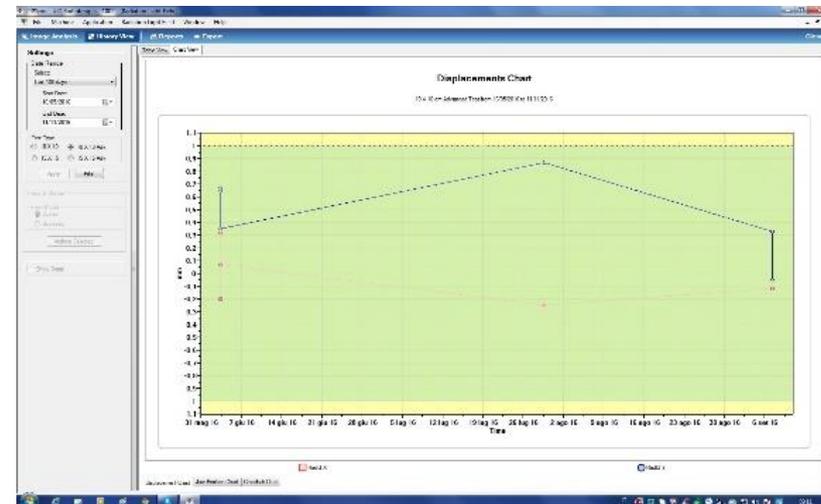

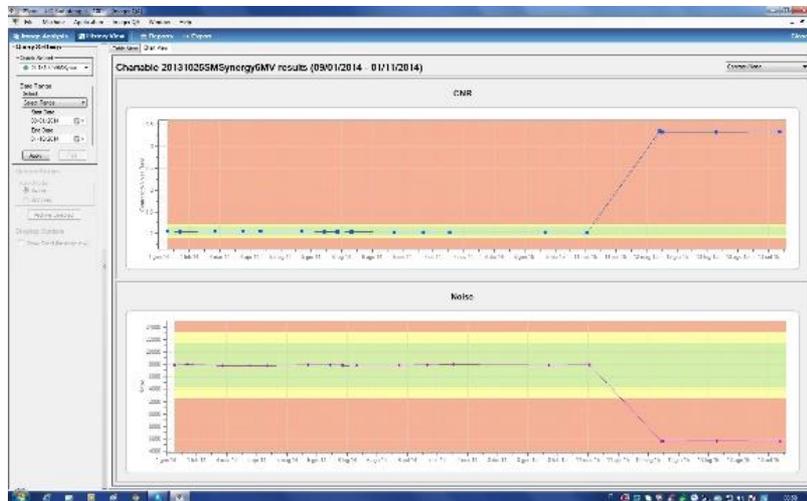

# DEFINE THE BASELINE AND REPEAT FREQUENTLY (AS LOW AS REASONABLE) THE QA TEST

# i.e. Isocenter and MLC position (Picket, Fence) Tests

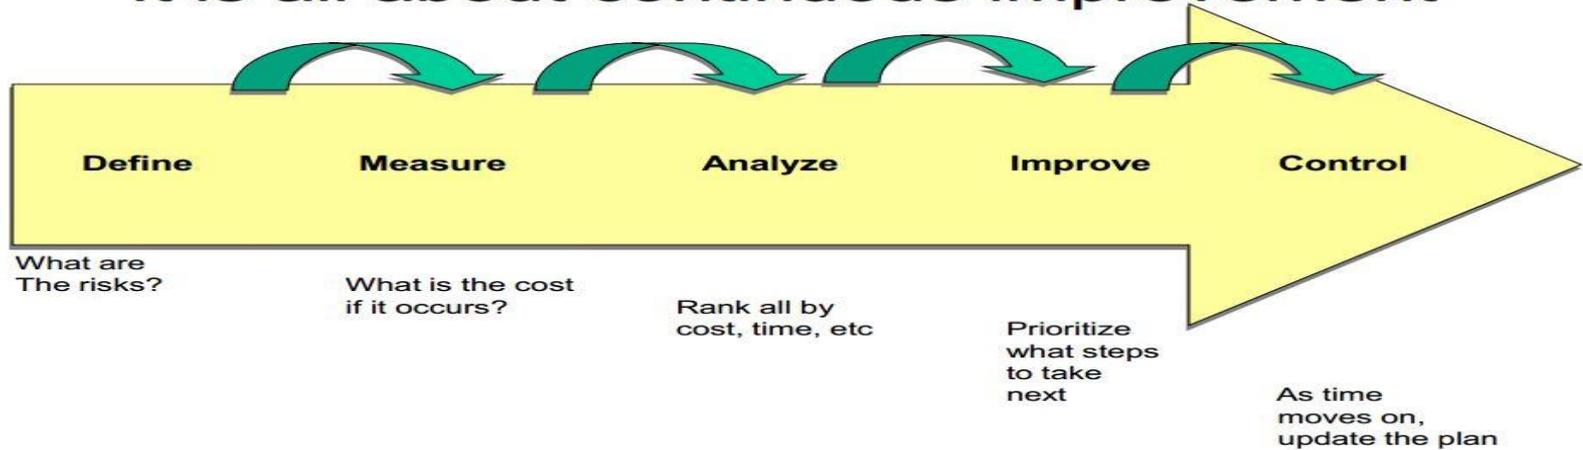

# Analyze and look at the trends vs. the baseline.....

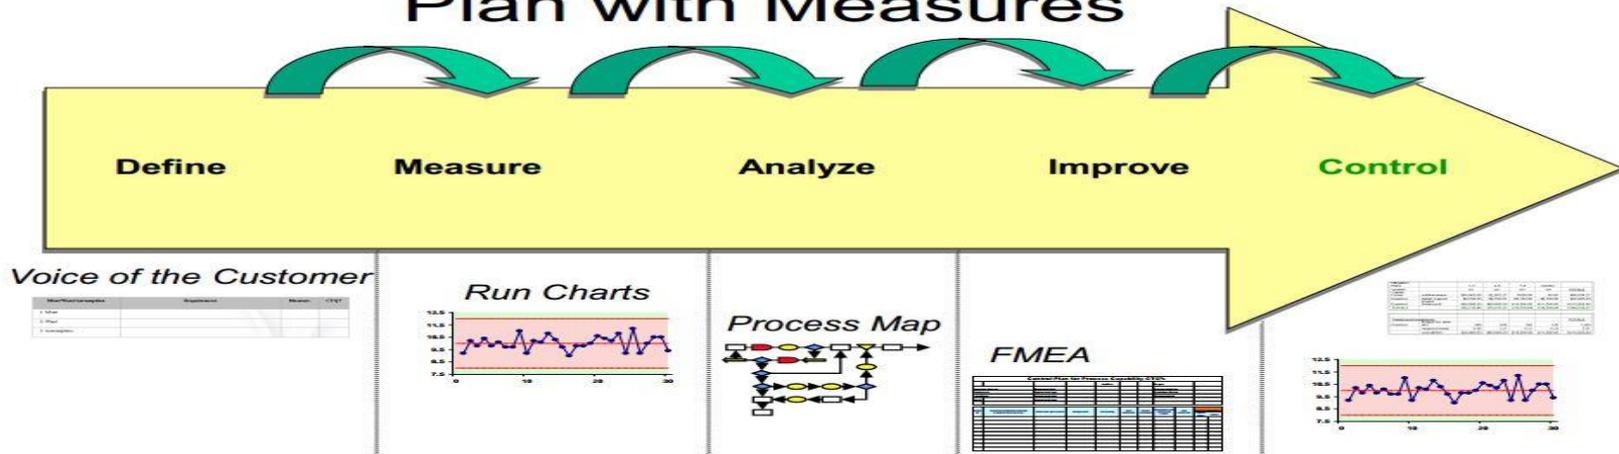

## Simplify theory (i.e. Six Sigma)

It is all about continuous improvement

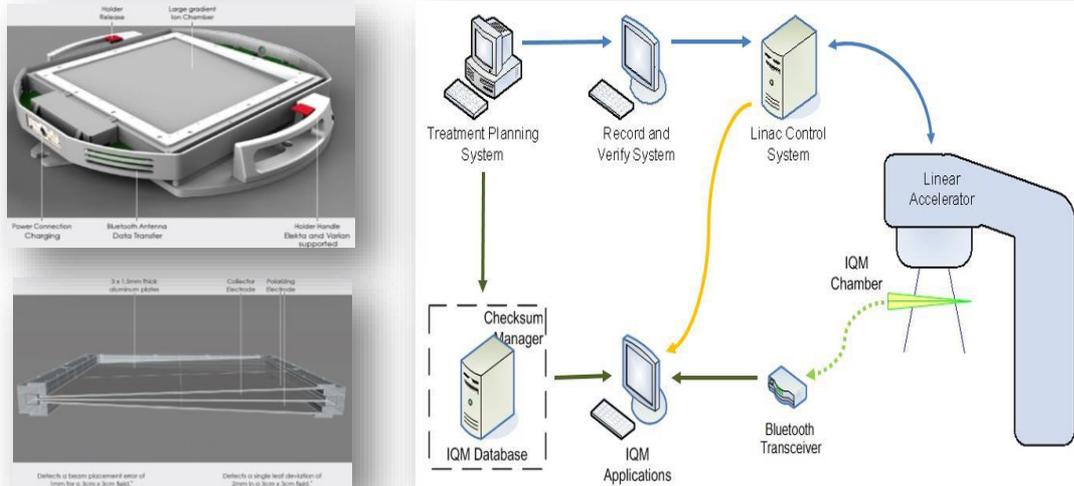

## Plan with Measures

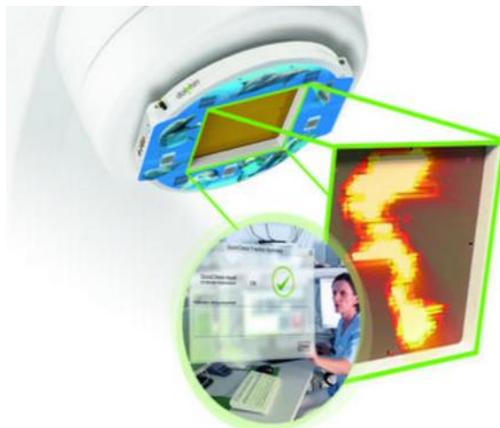

# ALTERNATIVE - INDEPENDENT REAL-TIME BEAM MONITOR SYSTEM

Beta-Tested @ Modena Hospital

Courtesy of Andrew Jongho Jung Princess Margaret Cancer Centre (Toronto)

- Possible QA of the LINAC
- Pre-Treatment QA activities
- Error prevention instead of error management
- Intra-fractional verification system
- Real-Time user interaction
- Automated monitoring of every single treatment fraction
- Patient delivery and safety improved in real-time
- In-Vivo evaluation

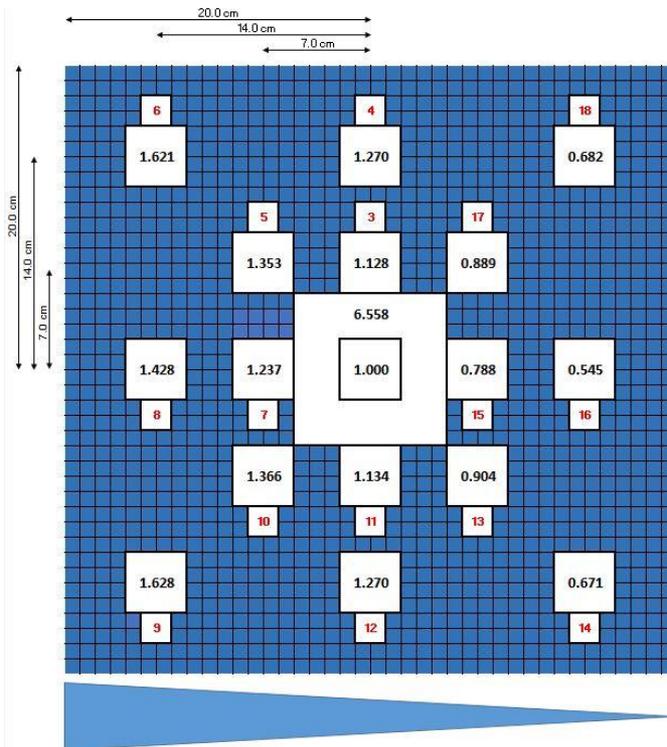

Installed @ Modena Hospital

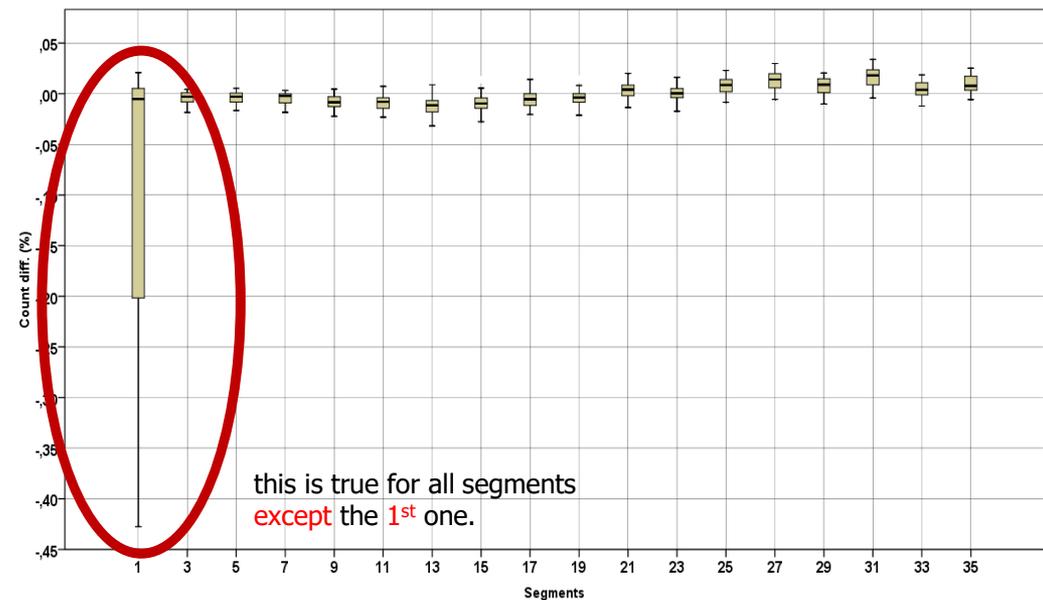

# IQM MAP QA - DAILY QA TEST FIELDS

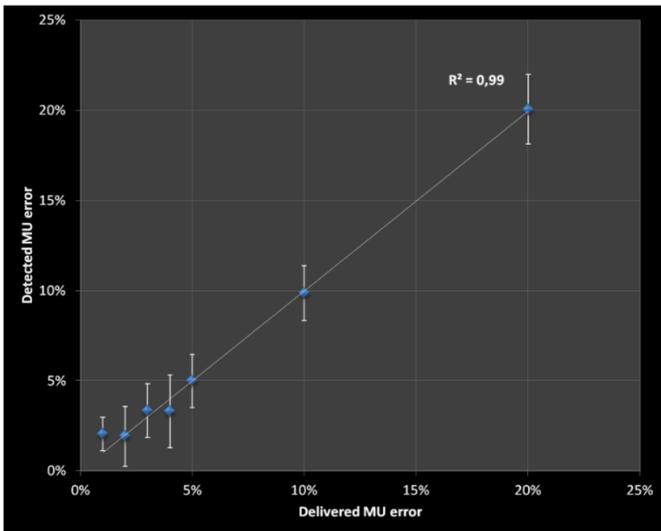

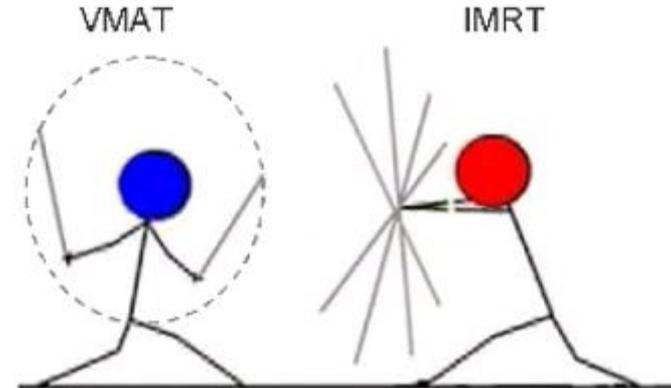

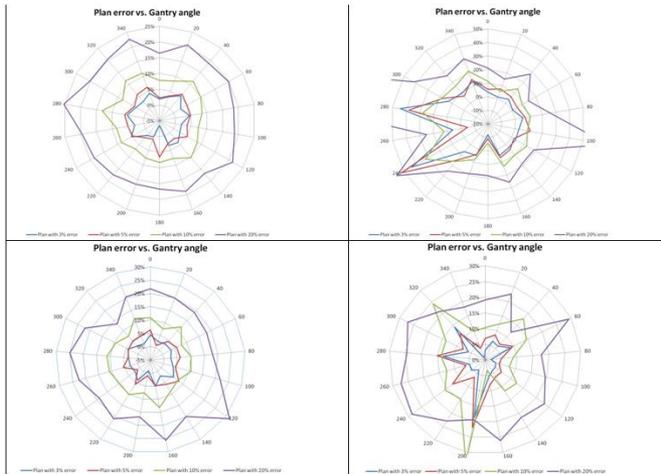

- IMRT plan
- 18 segments
- Irradiated with 6 MV photon
- Constant 50 MU/segment dose output

mean variability (for all segments) 0,7% and standard deviation of 4,7%

# Modeling of the measures (Theory vs. Practice)

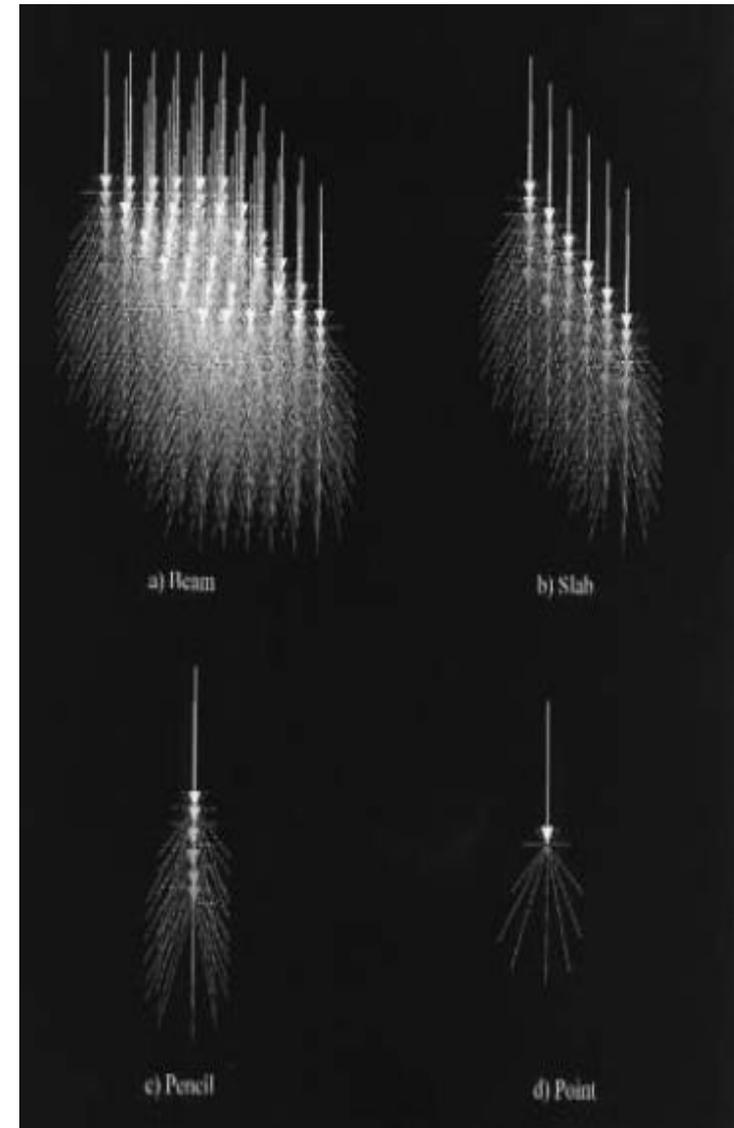

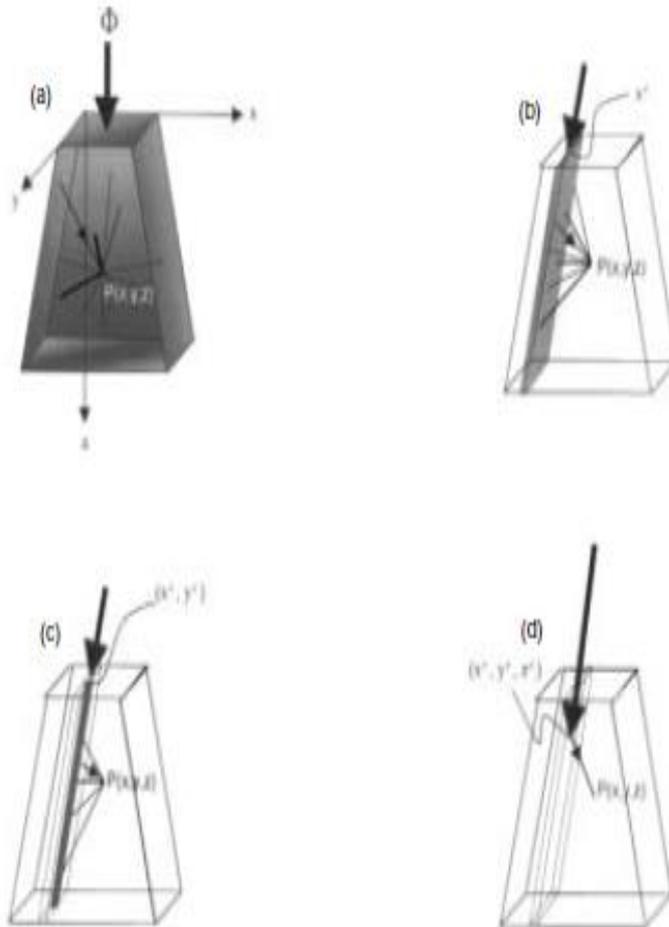

## MEASURE MISTAKE EFFECTS

Effect of shifting depth-ionization data measured with cylindrical chambers upstream by  $0.6 r_{cav}$  for photon beams and  $0.5 r_{cav}$  for electron beams (with  $r_{cav} = 1.0$  cm). For the electron beams, (b), further corrections are applied to obtain the  $\%dd(x)$  curve shown.

## QA – QUALITY ASSURANCE INSTRUMENTS

(i.e. Adaptive RT could based on CBCT calculation or we could need phantom for gating verification)

	Region	Homogenous, simple geometry	Complex geometry (wedge, inhomogeneity, asymmetry, blocks / MLC)	More complex geometries****
$\delta_1$	Central beam axis data - high dose, low dose gradient	2%	3%	4%
$\delta_2^*$	Build-up region of central axis beam, penumbra region of the profiles - high dose, high dose gradient	2 mm or 10%	3 mm or 15%	3 mm or 15%
$\delta_3$	Outside central beam axis region - high dose, low dose gradient	3%	3%	4%
$\delta_4^{**}$	Outside beam edges - low dose, low dose gradient	30% (3%)	40% (4%)	50% (5%)
$RW_{50}^{***}$	Radiological width - high dose, high dose gradient.	2 mm or 1%	2 mm or 1%	2 mm or 1%
$\delta_{50,90}$	Beam fringe - high dose, high dose gradient	2 mm	3 mm	3 mm
