

# Rainfall runoff simulation in semi-arid area using distributed CHyM model (Case study: DEZ River Basin (Iran) )

**June 2017**

**Fourth Workshop on Water Resources in Developing Countries:  
Hydroclimate Modeling and Analysis Tools**

**Ali Shahabzi  
Hamireza mosaffa  
Vesta Afzali**

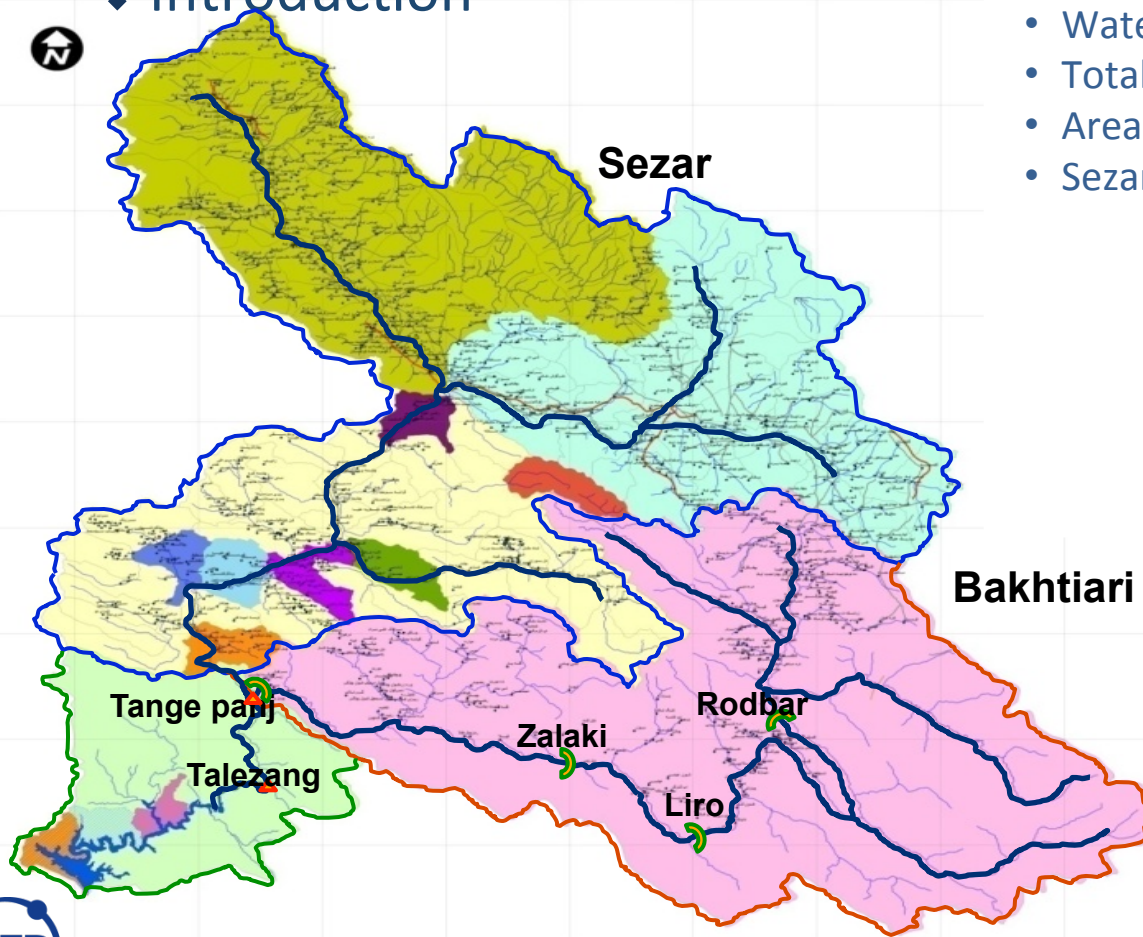

- ❖ Introduction
- ❖ Rainfall & discharge variability
- ❖ Model setup and configuration
- ❖ Results
- ❖ Conclusion

## ❖ Introduction

- Water Budget :7.5 billion m<sup>3</sup>/y
- Total Capacity Dam: 2.7 billion m<sup>3</sup>
- Area of Dez Basin:17,600 km<sup>2</sup>
- Sezar + Bakhtiari= Dez

### Inflow of DEZ Basin:

Inflow Bakhtiari:	4346 mcm
Inflow Sezar:	1998 mcm
Mid flow	1156 mcm
<b>Sum:</b>	<b>7500mcm</b>

## ❖ Introduction

**Why this area...?!!!**  
**Why flood study ...?!!!**

- ✓ In comparison with the total inflow, Dez dam capacity is very low so spill is very frequent
- ✓ Base on dam rule curve we need a big amount of flood control volume in rainy season
- ✓ In late of rainy season it means we can lose the opportunity of fulfilling dam and encountering drought in down stream
- ✓ If We do not obey the rule curve flooding downstream is a high risk (like 2016 Jan. flood)
- ✓ So we need forecasting of flood discharge parameters (like volume and peak); in this step rainfall-runoff model have a vital rule

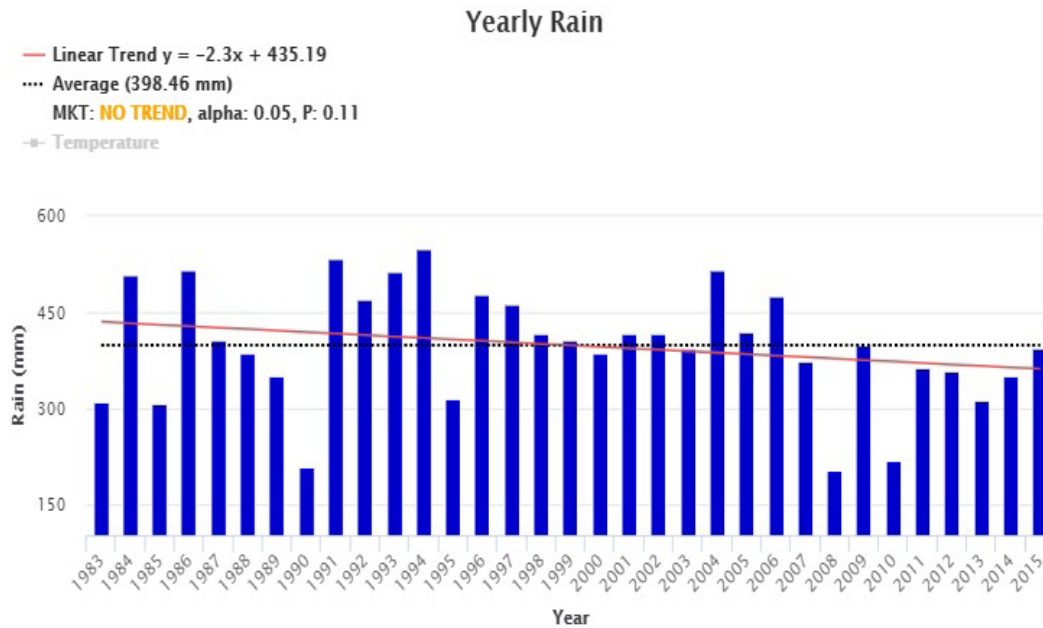

- ❖ Introduction
- ❖ **Rainfall & discharge variability**
- ❖ Model setup and configuration
- ❖ Results
- ❖ Conclusion

## ❖ Rainfall & discharge

Longitude: (30.279 34.120)

Latitude: (48.026 51.988)

Yearly Rain (mm)  
Climatology 1983 - Present

## ❖ Rainfall & discharge

Wet and dry periods in 50 years

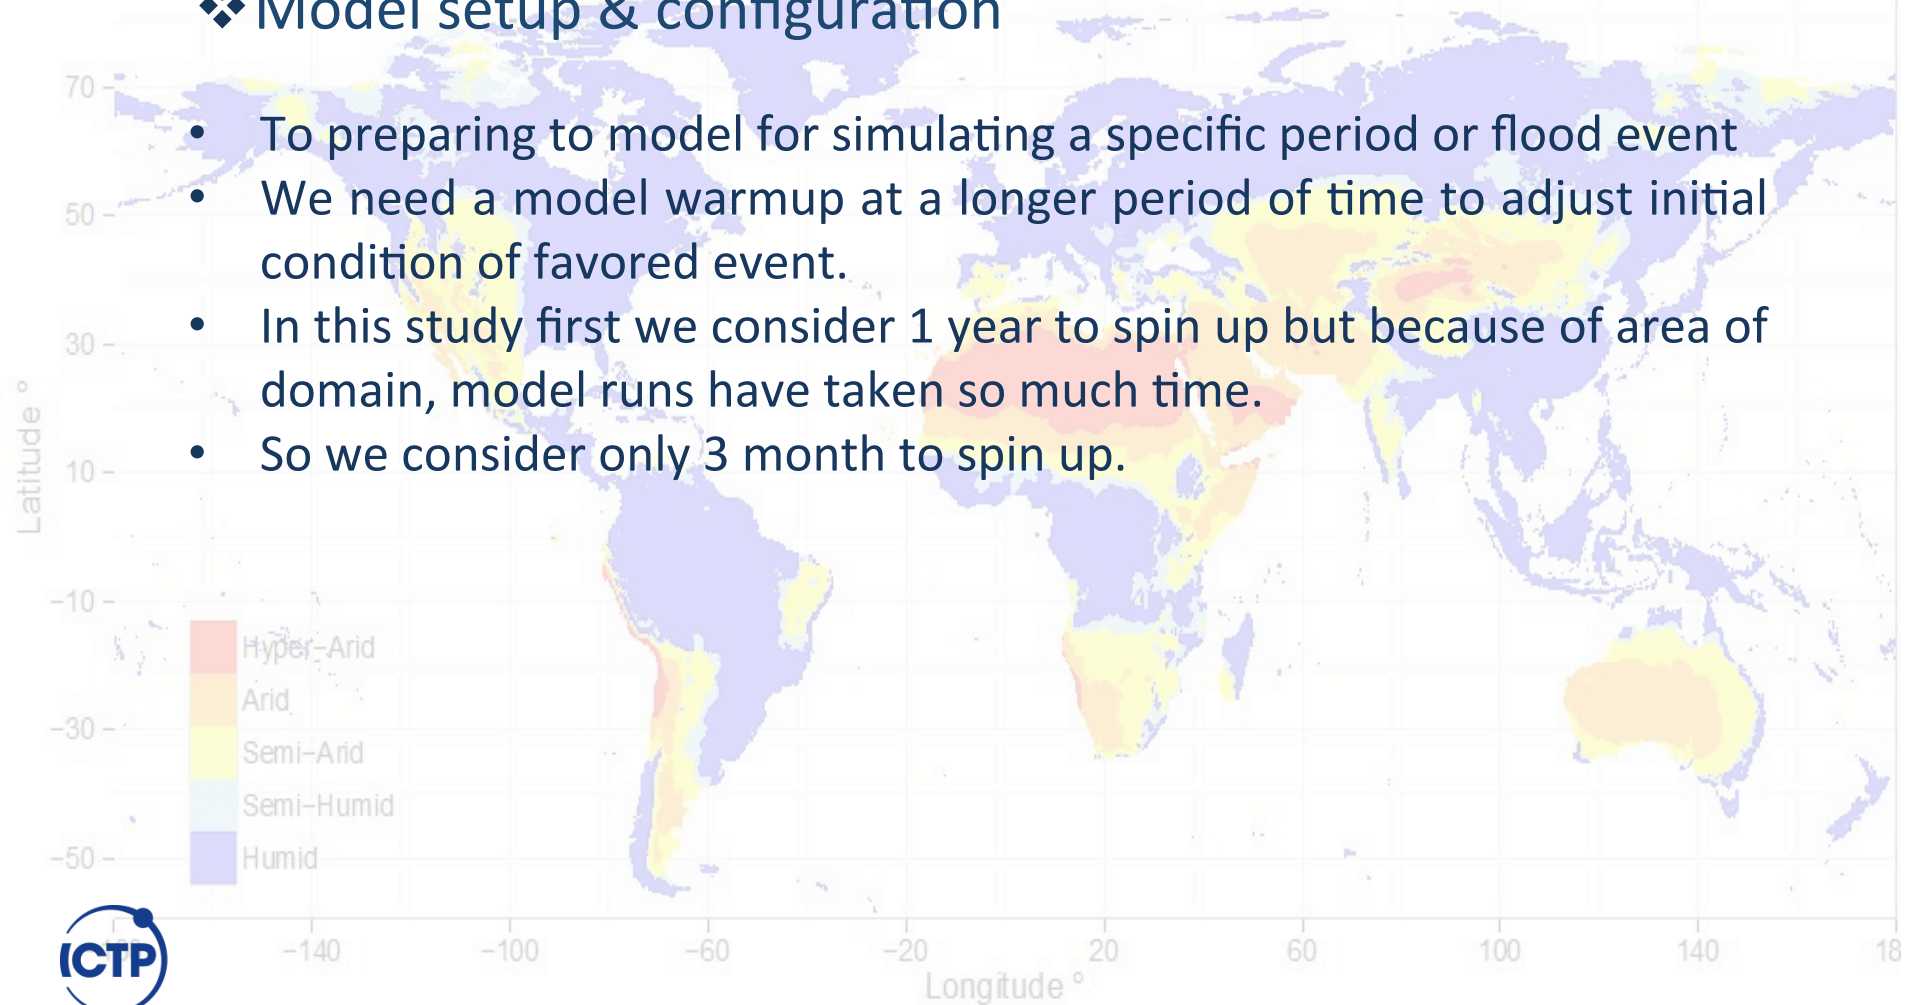

- ❖ Introduction
- ❖ Rainfall & discharge variability
- ❖ Model setup and configuration
- ❖ Results
- ❖ Conclusion

## ❖ Model setup & configuration

- To preparing to model for simulating a specific period or flood event
- We need a model warmup at a longer period of time to adjust initial condition of favored event.
- In this study first we consider 1 year to spin up but because of area of domain, model runs have taken so much time.
- So we consider only 3 month to spin up.

## ❖ Model setup & configuration

- Rainfall: TRMM
- DEM: Hydroshed
- Temperature: ERAI
- Start date: 2011.01.01
- Date of event 1 March to 17 March 2011

## ❖ Model setup & configuration

	nlon	nlat	dij	CHYM steps	$\alpha$	infiltra	Return flow factor

12	418	311	0.0045	120	0.0015	100	$6.8 * 10^{-7}$

- ❖ Introduction
- ❖ Rainfall & discharge variability
- ❖ Model setup and configuration
- ❖ Results**
- ❖ Conclusion

## Accumulated discharge during simulation period pixel size ( 900m)

## Accumulated discharge during simulation period pixel size ( 225m) $\Delta T=50$

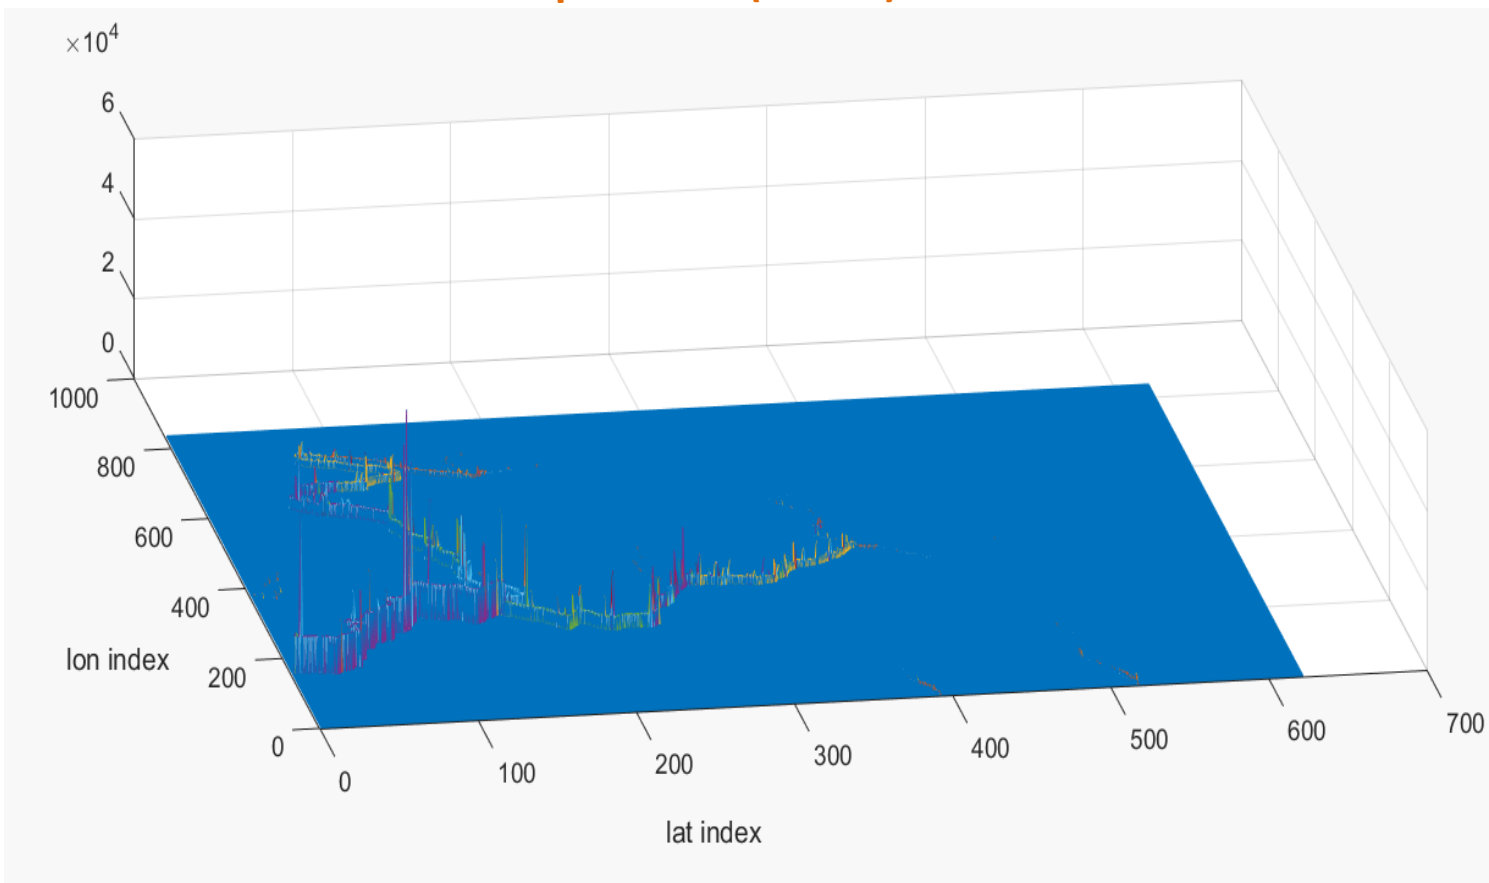

## Accumulated discharge during simulation period pixel size( 225m) $\Delta T=80$

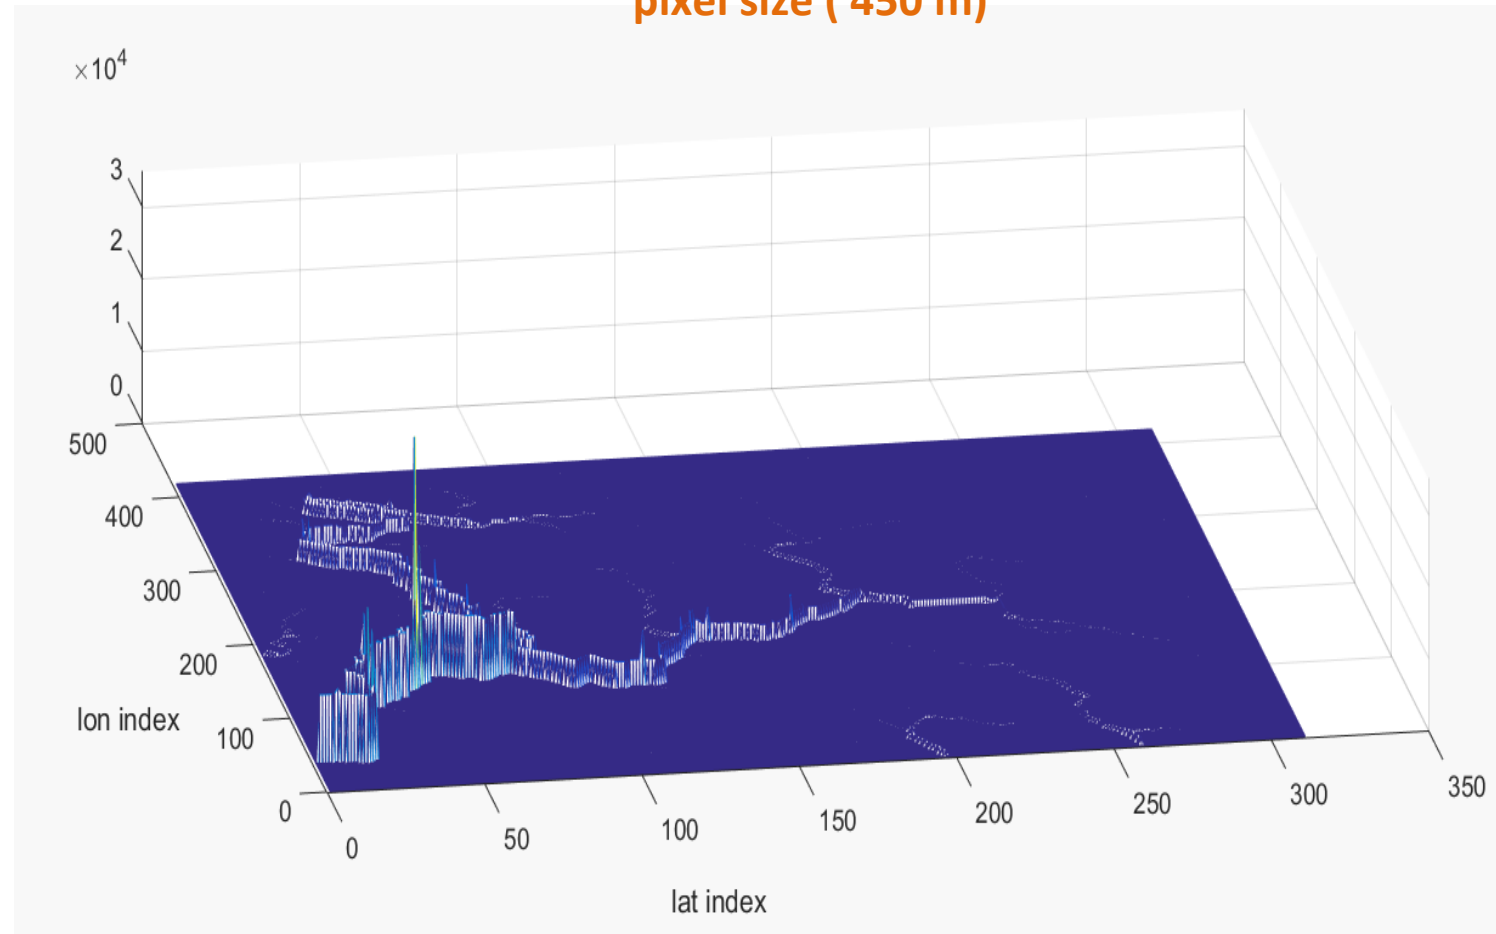

## Accumulated discharge during simulation period pixel size ( 225m) $\Delta T=120$

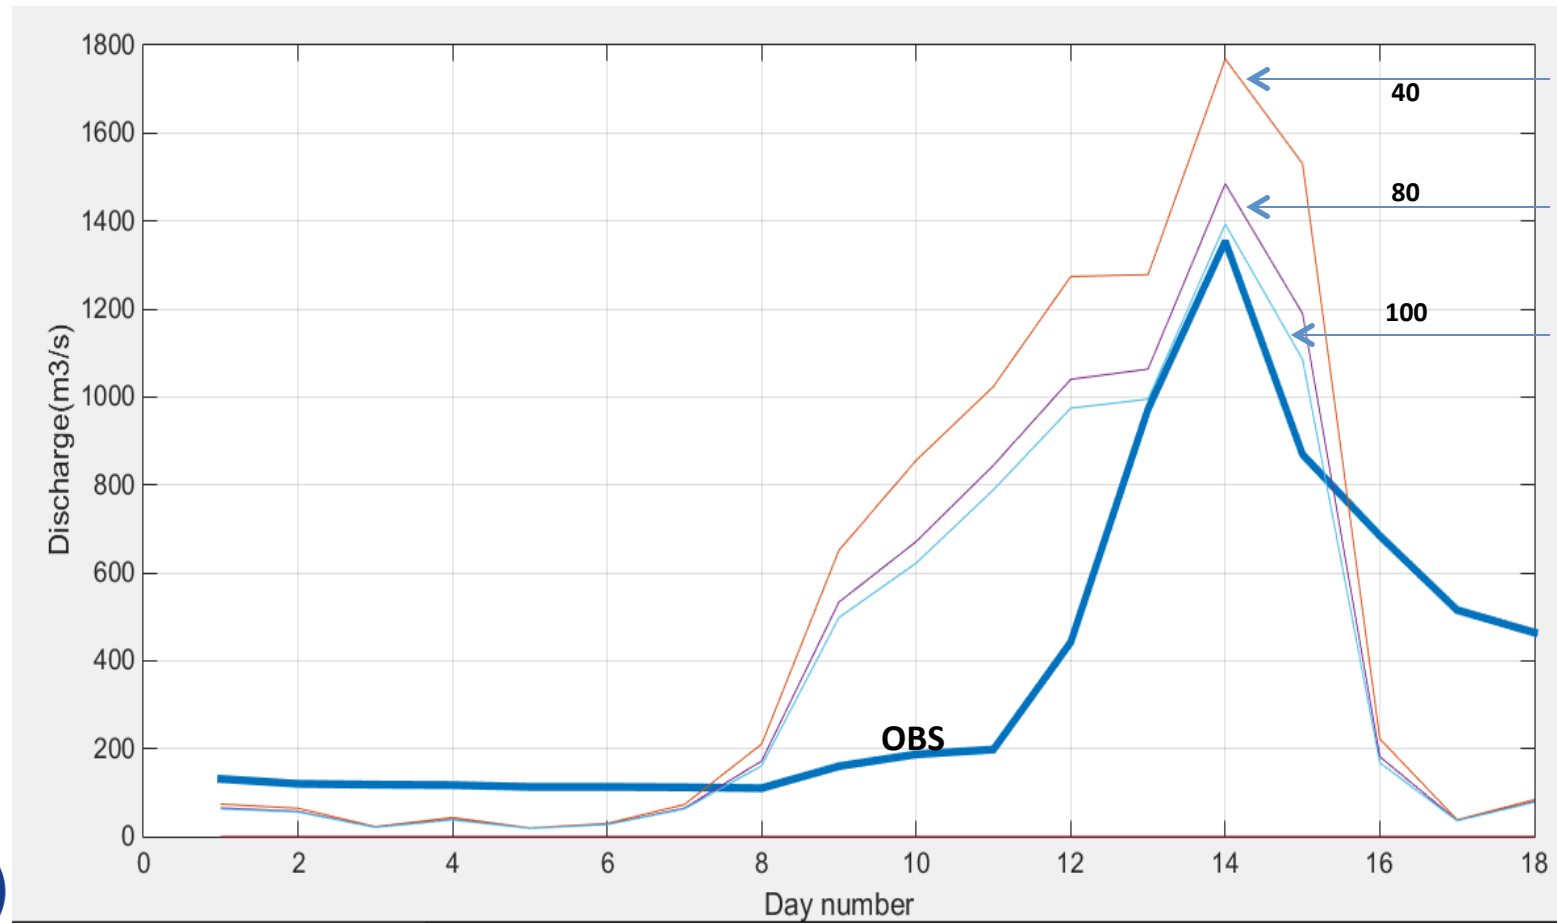

## Accumulated discharge during simulation period pixel size ( 450 m)

## Effect of changing infiltration parameter in output hydrograph

## Effect of changing return flow parameter in output hydrograph

- ❖ Introduction
- ❖ Rainfall & discharge variability
- ❖ Model setup and configuration
- ❖ Results
- ❖ Conclusion

## ❖ Conclusion

- ✓ Chym Model estimates precisely peaks of Hydrographs for the mentioned basin

More and more study

Sensitivity Analysis

Validation

**THANK YOU!**
