What Added Value (AV) Means?

The AV of dynamical downscaling is a measure of the extend to which the downscaled climate is closer to the observations than the model from which the Boundary Conditions where obtained. (Di Luca et al. 2015)

$$AV = | (GCM - Obs) | - | (RCM - Obs) |$$

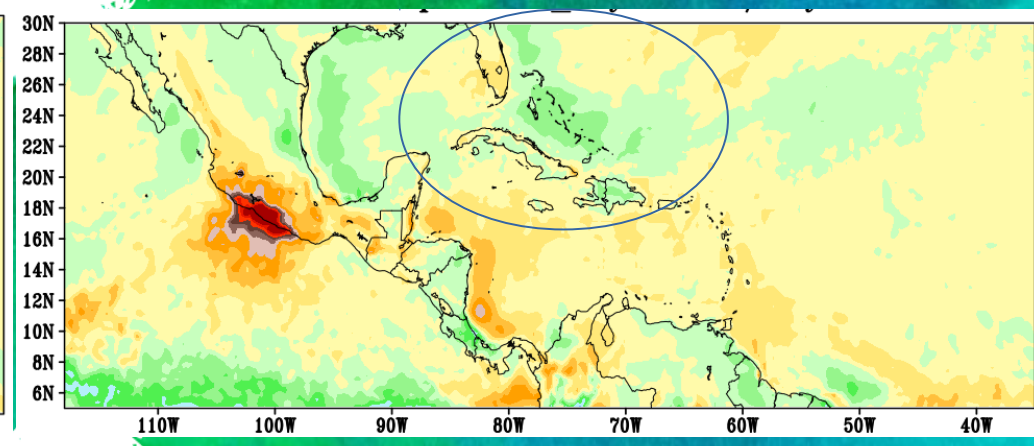

The Abdus Salam
International Centre
for Theoretical Physics

AV Dry & Wet P.

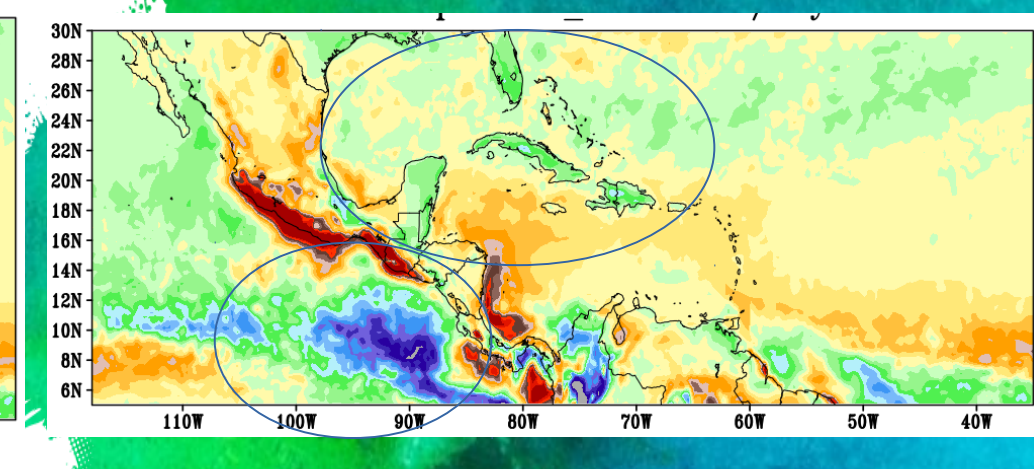

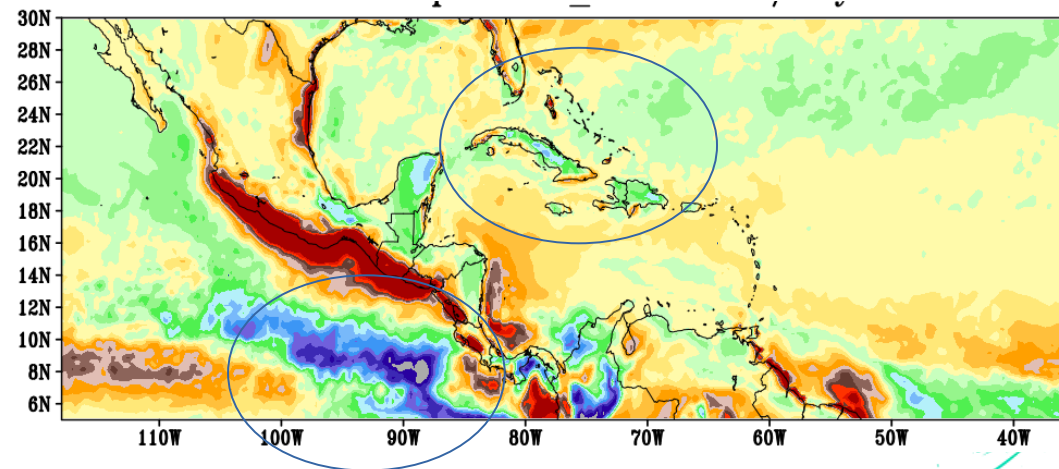

TkEm (Dry P.)

KfEm (Dry P.)

TkEm (Wet P.)

KfEm (Wet P.)

The Abdus Salam
International Centre
for Theoretical Physics

Summary

We know that the AV is related with the horizontal resolution, the domain size, with the boundary conditions, from other researchers. Here after we use different metrics we found substantial AV of RCM downscaling in all precipitation metrics considered related also to the cumulus parameterization. The AV was clearly associated with the cumulus used being the configuration KfEm the most prominent.
