

Regional climate information needs for assessing impacts and risk

Suraje Dessai (WGI Chp12) and Maarten van Aalst (WG2 Ch16)

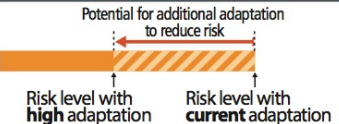

Risk management framework

Level of additional risk due to climate change

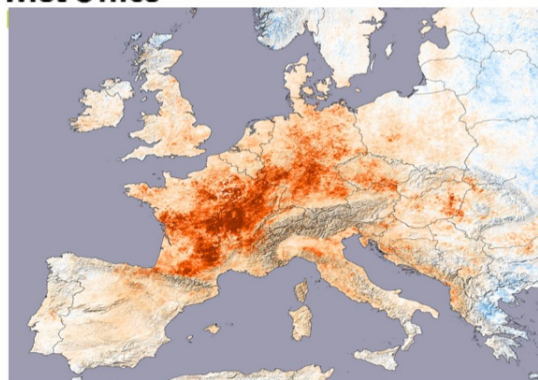

Undetectable Moderate High Very high

Climate-related drivers of impacts										Level of risk & potential for adaptation		
												
Warming trend	Extreme temperature	Drying trend	Extreme precipitation	Precipitation	Snow cover	Damaging cyclone	Sea level	Ocean acidification	Carbon dioxide fertilization			
Africa												
Key risk		Adaptation issues & prospects				Climatic drivers		Timeframe		Risk & potential for adaptation		
<p>Compounded stress on water resources facing significant strain from overexploitation and degradation at present and increased demand in the future, with drought stress exacerbated in drought-prone regions of Africa (<i>high confidence</i>)</p> <p>[22.3-4]</p>		<ul style="list-style-type: none">Reducing non-climate stressors on water resourcesStrengthening institutional capacities for demand management, groundwater assessment, integrated water-wastewater planning, and integrated land and water governanceSustainable urban development				   				Very low	Medium	Very high
								Present				
								Near term (2030–2040)				
								Long term (2080–2100)				
								2°C				
4°C												
<p>Reduced crop productivity associated with heat and drought stress, with strong adverse effects on regional, national, and household livelihood and food security, also given increased pest and disease damage and flood impacts on food system infrastructure (<i>high confidence</i>)</p> <p>[22.3-4]</p>		<ul style="list-style-type: none">Technological adaptation responses (e.g., stress-tolerant crop varieties, irrigation, enhanced observation systems)Enhancing smallholder access to credit and other critical production resources; Diversifying livelihoodsStrengthening institutions at local, national, and regional levels to support agriculture (including early warning systems) and gender-oriented policyAgronomic adaptation responses (e.g., agroforestry, conservation agriculture)				   				Very low	Medium	Very high
								Present				
								Near term (2030–2040)				
								Long term (2080–2100)				
								2°C				
4°C												
<p>Changes in the incidence and geographic range of vector- and water-borne diseases due to changes in the mean and variability of temperature and precipitation, particularly along the edges of their distribution (<i>medium confidence</i>)</p> <p>[22.3]</p>		<ul style="list-style-type: none">Achieving development goals, particularly improved access to safe water and improved sanitation, and enhancement of public health functions such as surveillanceVulnerability mapping and early warning systemsCoordination across sectorsSustainable urban development				  				Very low	Medium	Very high
								Present				
								Near term (2030–2040)				
								Long term (2080–2100)				
								2°C				
4°C												

Met Office

Human influence has very likely at least doubled the probability of European summer temperatures as hot as 2003

1900 copyright Met Office 1950 2000

Stott, Stone, Allen, Nature 2004

Do we really mean regional, or often also local?

The Hague heat map (Delft University of Technology 2018)

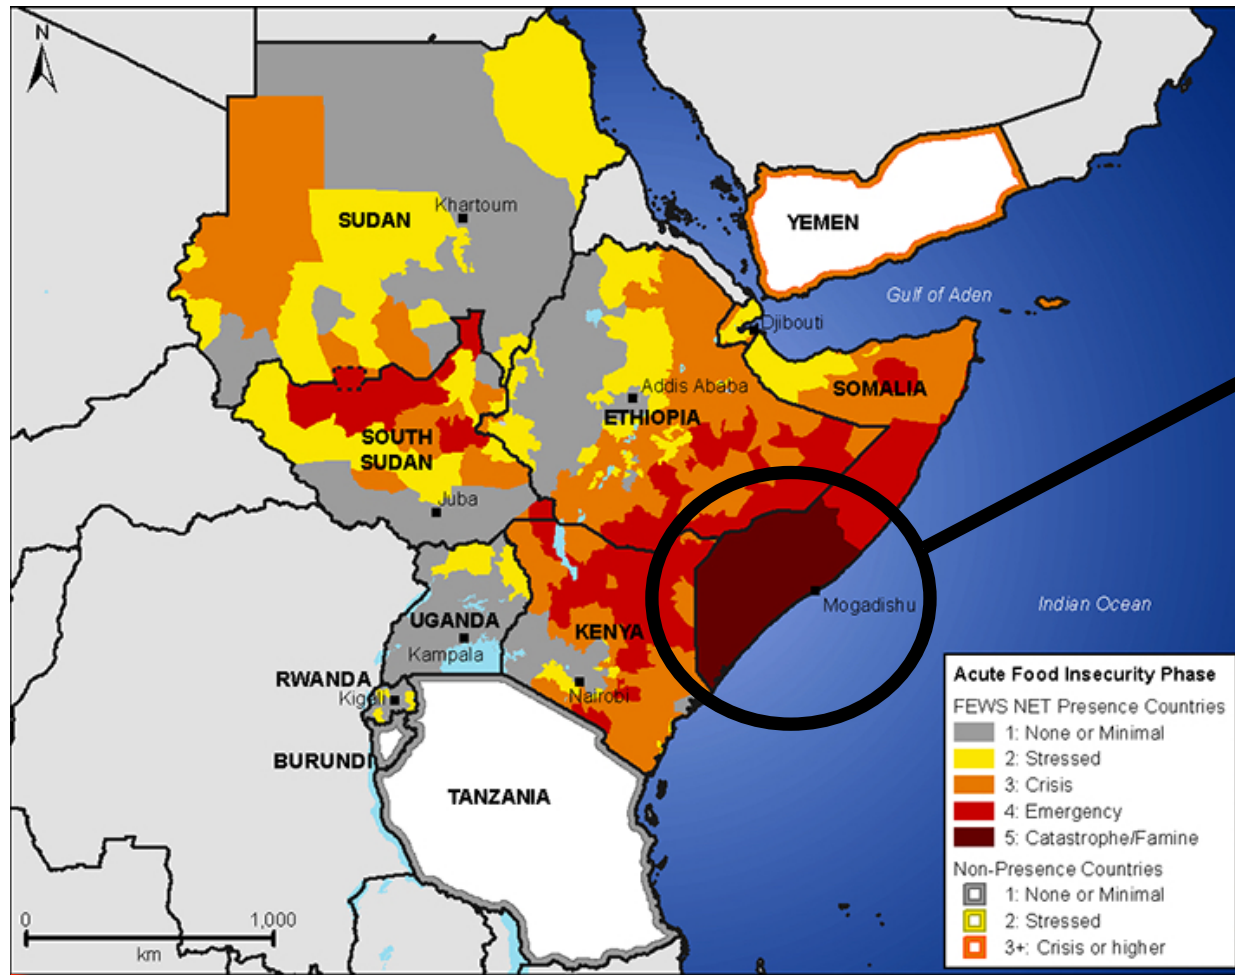

and how we manage changing risk....

Netherlands heatwave September 2016: no public warning despite high temperatures, ***under the (false) assumption that nights would be cooler in September...***

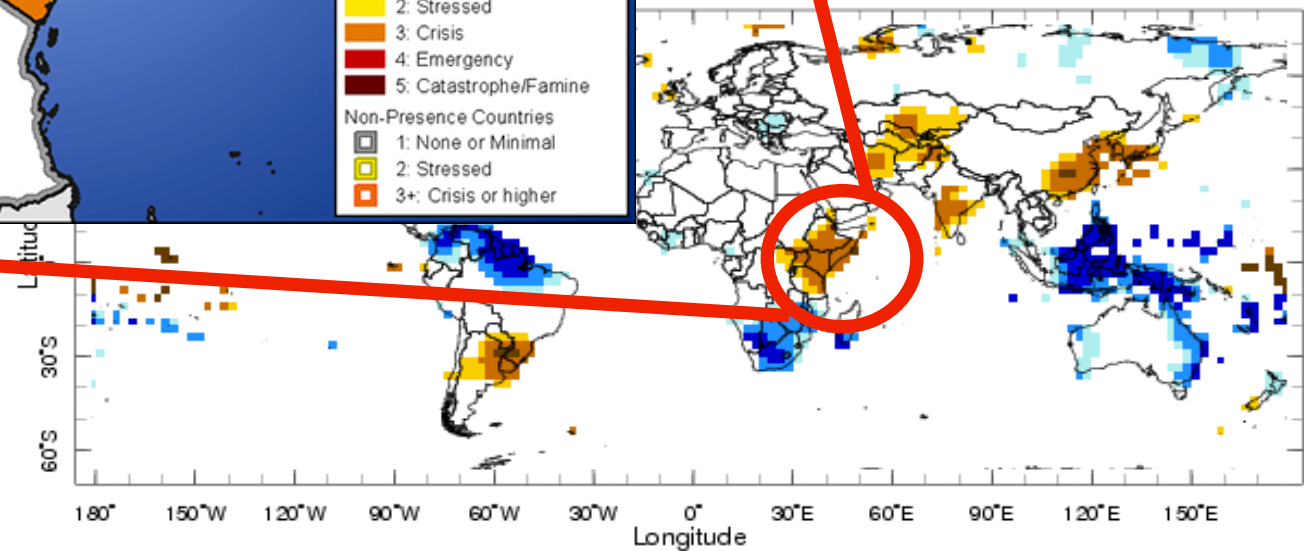

Source: KNMI climate explorer, using ECMWF forecast data

Highly differentiated impacts

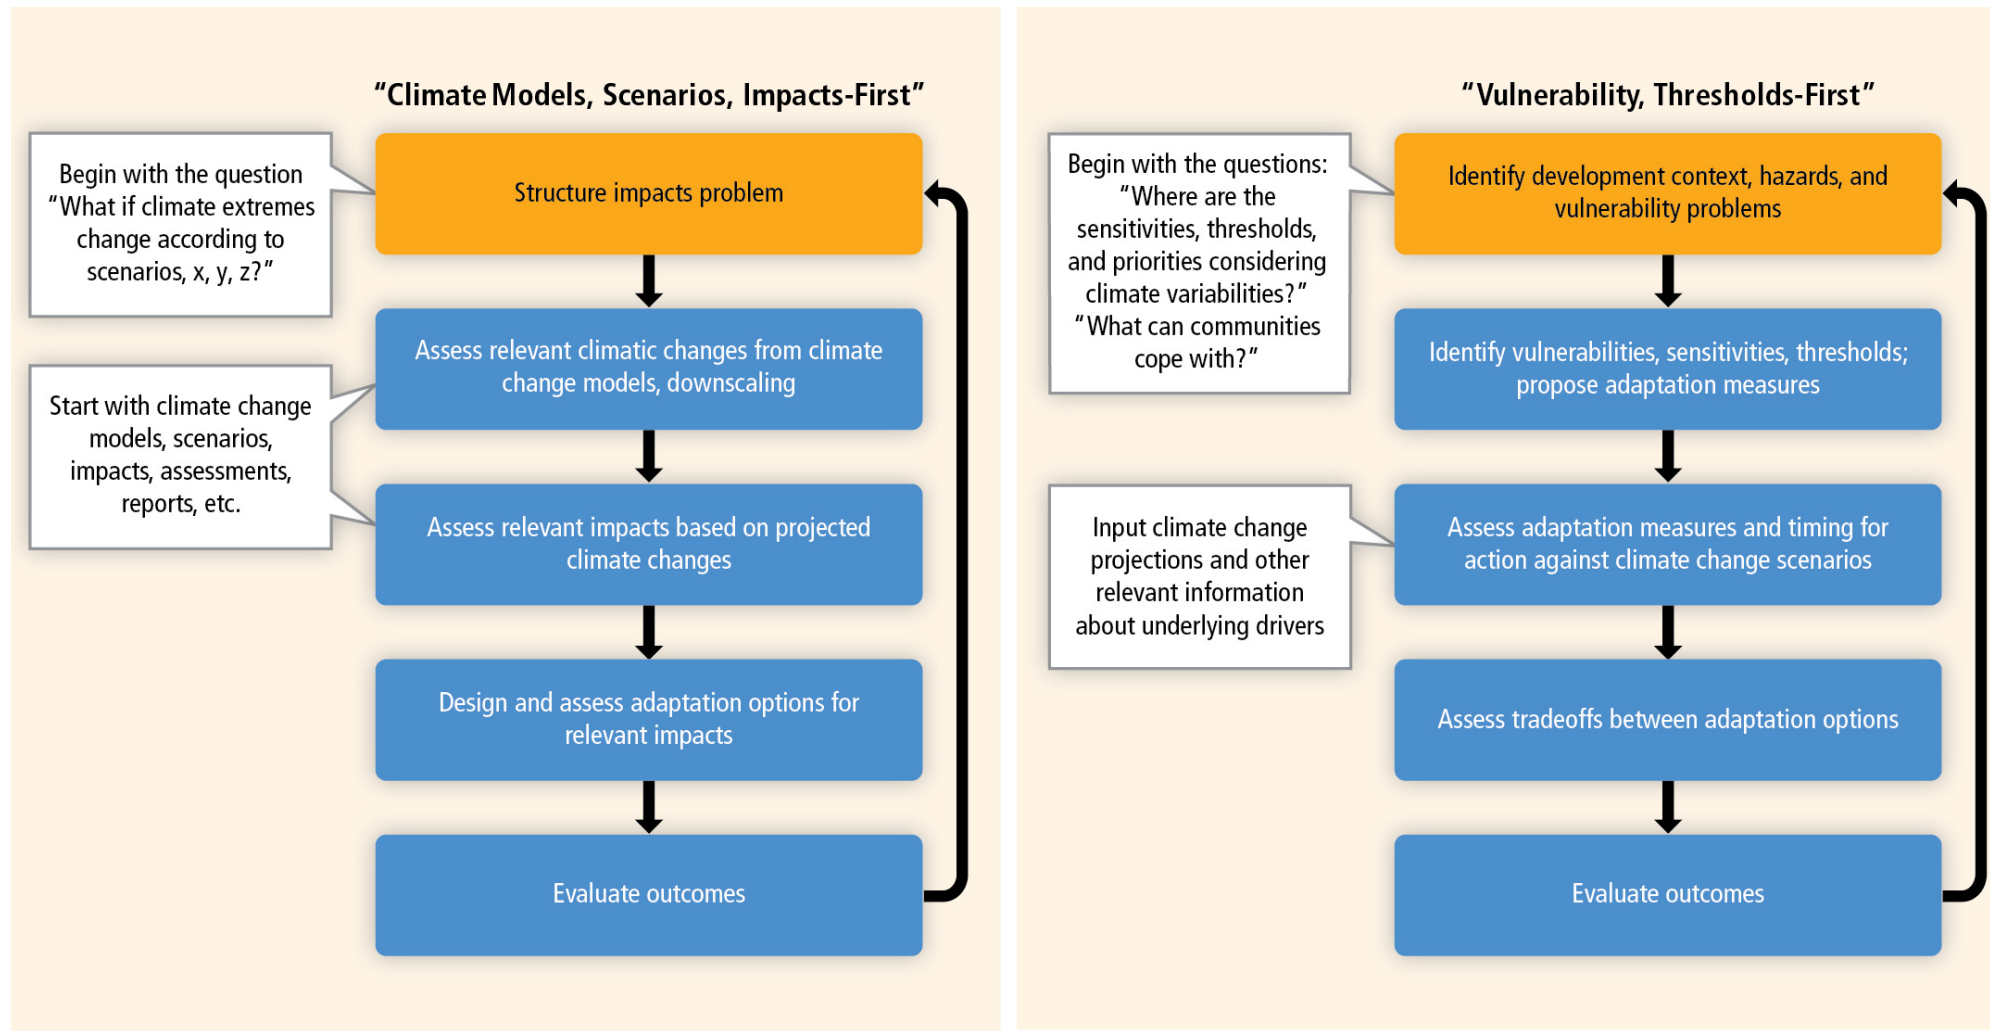

(e.g. very high child mortality), with lasting effects, also on future vulnerability

Food security (FEWS)

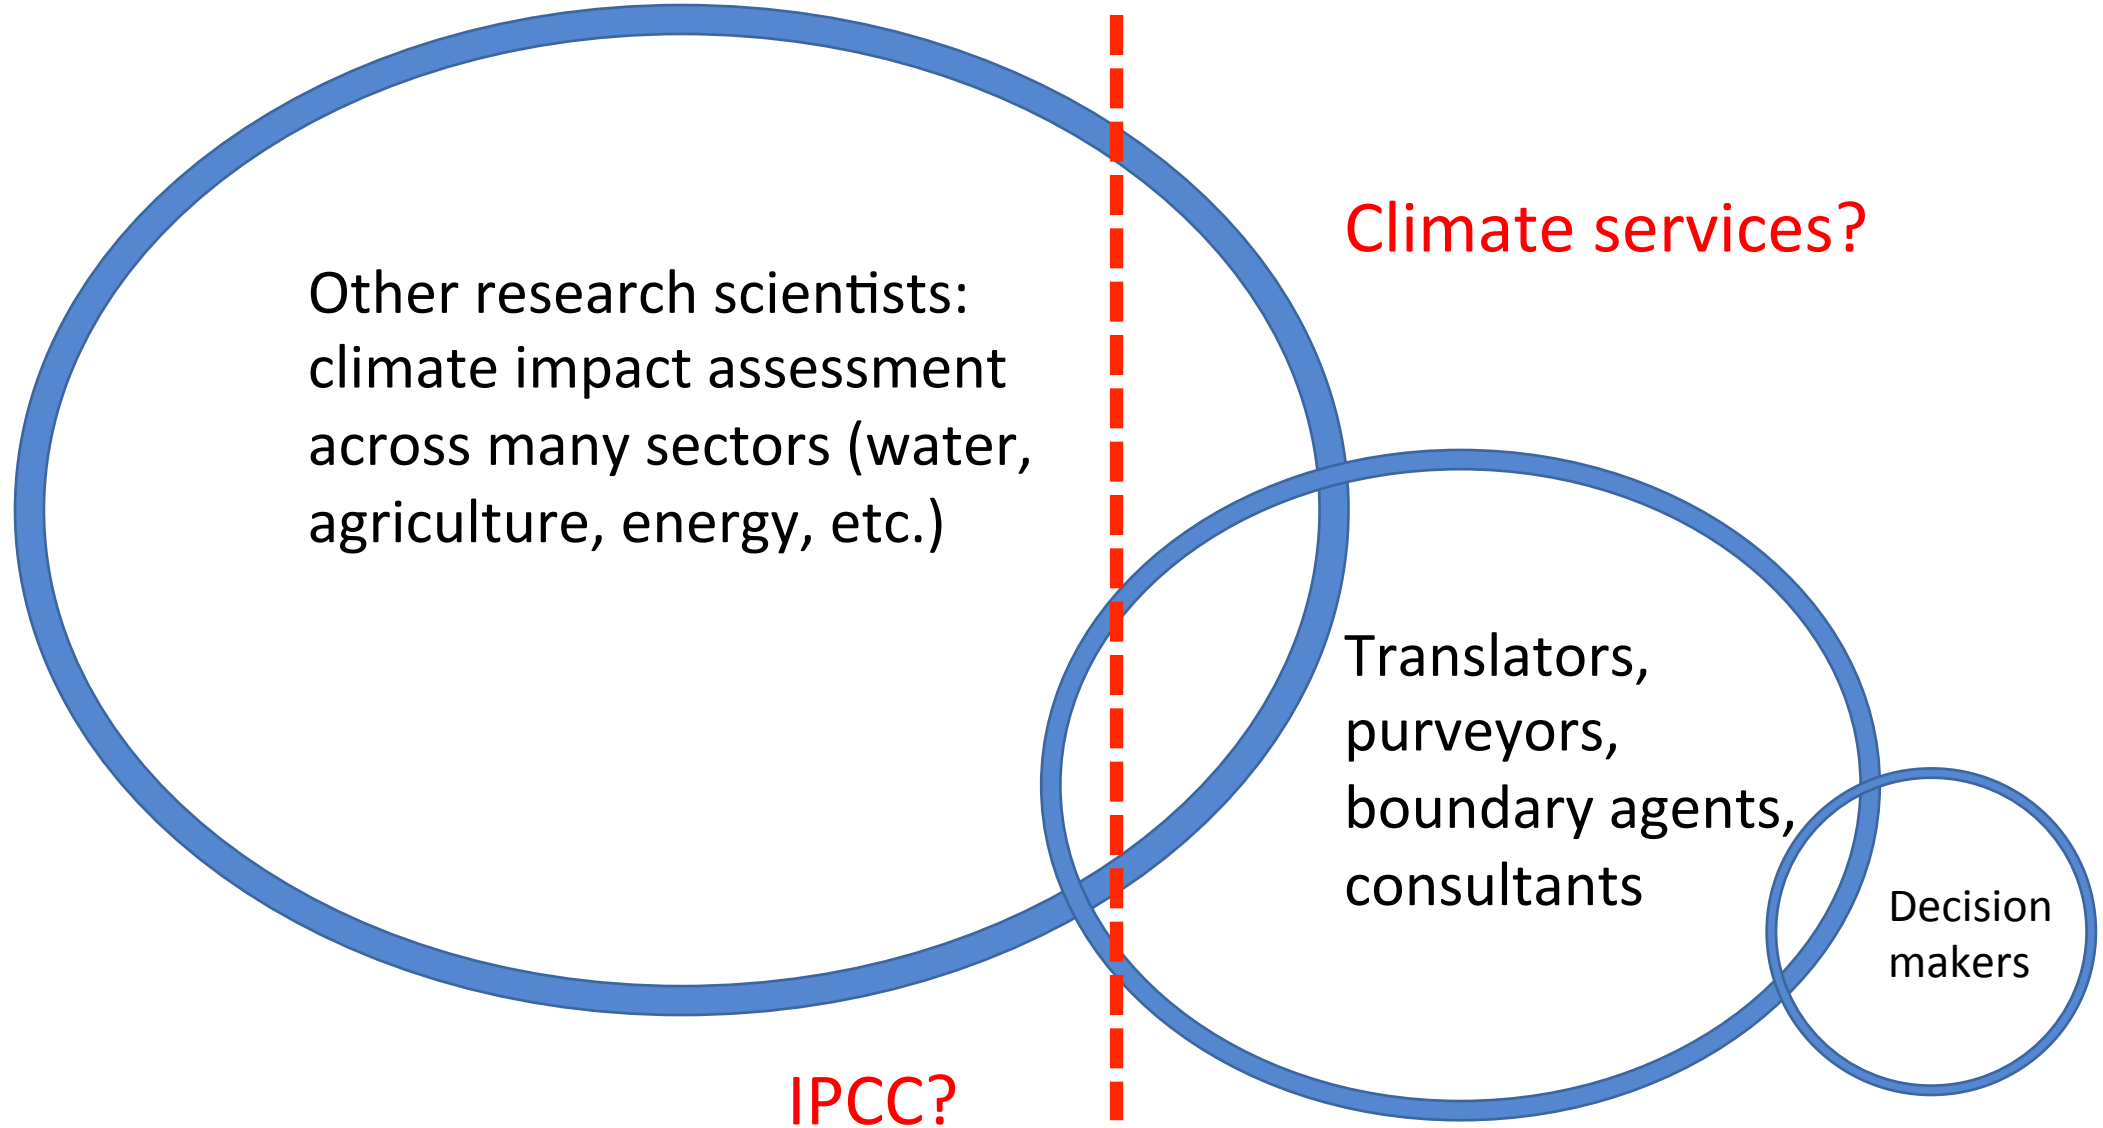

Forecast for Nov 2010 - Jan 2011, Forecast Issued Oct 2010

Framing of risk analysis determines climate information needs

Top-down scenario, impacts-first approach (left panel) and bottom-up vulnerability, thresholds-first approach (right panel) – comparison of stages involved in identifying and evaluating adaptation options under changing climate conditions (IPCC SREX, 2012).

The diverse needs of WGII: vulnerability, impacts and adaptation

Demand for climate information

- Research needs: advancement of scientific knowledge
- Legislation: UK climate change act 2008 – period Climate Change Risk Assessment; Adaptation Reporting Power
- Soft standards: Task Force on Climate-related Financial Disclosures (TCFD) – physical climate risk and opportunities on business and investment
- Self-interest from organizations, cities, etc.

Figure SR.1: Top six areas of inter-related climate change risks for the United Kingdom

Flooding and coastal change risks to communities, businesses and infrastructure (Ch3, Ch4 Ch5, Ch6)	MORE ACTION NEEDED
Risks to health, well-being and productivity from high temperatures (Ch5, Ch6)	
Risk of shortages in the public water supply, and for agriculture, energy generation and industry (Ch3, Ch4, Ch5, Ch6)	
Risks to natural capital, including terrestrial, coastal, marine and freshwater ecosystems, soils and biodiversity (Ch3)	
Risks to domestic and international food production and trade (Ch3, Ch6, Ch7)	
New and emerging pests and diseases, and invasive non-native species, affecting people, plants and animals (Ch3, Ch5, Ch7)	RESEARCH PRIORITY
NOW ----- RISK MAGNITUDE ----- FUTURE LOW MEDIUM HIGH	

Source: ASC synthesis of the main areas of risk and opportunity within the chapters of the Evidence Report.

Notes: Future magnitude is based on a combination of climate change and other drivers of risk (e.g. demographic change), taking account of how current adaptation policies and plans across the UK are likely to reduce risks.

The use of climate information in adaptation decision-making

- Europe (Bruno Soares et al. 2018 – survey n = 462; interviews n=80)
 - diversity of needs and requirements across sectors
 - Opportunity: interest in the near-term timescale (decadal prediction)
 - Barriers and enablers: the format of the information provided, the need for compatibility with existing in-house systems, and the perceived credibility and trust of information providers
- Africa and India (Singh et al. 2017)
 - successful examples predominantly use daily, weekly and seasonal climate information for decision-making over short time horizons
 - very few clear examples of long-term climate information being used to inform decisions at subnational scales
 - Barriers: uncertainty, risk averseness and constraints in justifying funding allocations on prospective risks

Priorities

- Risk information for **decision-making under uncertainty**
 - Past present and future
 - Including uncertainties (and highlighting potential surprises)
- **Better insight in system dynamics**
 - Compound impacts
 - Thresholds (not just defined by physical systems)
 - Note: choices (adaptation) affect current and future risks (observed adaptation)
- Clarifying the interface with climate services

To consider...

- Testing products and iterating with prospective users
- Interface with climate services
