

# PRESENTATION OF THE NETCDF FILE FORMAT AND TOOLS FOR PROCESSING AND VISUALIZATION

# Outline

1 Background: Climate Modelling

2 netCDF format for climate data

3 Analysis and Processing of netCDF data

4 Visualisation of netCDF data

“We do not inherit the Earth from our Ancestors, we borrow it from our Children”

# 1 Background: Climate Modelling

# 1- Background: Climate Modelling

- Special demands for data storage
  - large data sets (100s of MByte per simulation year)
  - data sets to be merged / split into subsets
  - gridded data
    - many physical quantities → meta-data becomes of relevance

# 1- Background: Climate Modelling

Classical ASCII data: not a suitable file format

- input / output relatively slow
- storage of numerical data via characters inefficient
- data structure difficult to represent
- handling of metadata difficult

## 1 Background: Climate Modelling

## 2 netCDF format for climate data

## 3 Analysis and Processing of netCDF data

## 4 Visualisation of netCDF data

“We do not inherit the Earth from our Ancestors, we borrow it from our Children”

## 2- netCDF format for climate data

### 2-a) What are netCDF data?

Network Common Data Form (NetCDF) is a file format that stores multidimensional (variable) scientific data, such as temperature, humidity, pressure, wind speed and direction. Each of these variables can be displayed via a dimension (for example, time)

Examples of netCDF data: left (temperature); right (pressure at specific locations)

## 2- netCDF format for climate data

### 2-b) How to learn more about netCDF?

The first source of information about netCDF data is the Unidata community:

<https://www.unidata.ucar.edu/software/netcdf/>

Unidata is a diverse community of education and research institutions with the common goal of sharing geoscience data and the tools to access and visualize that data.

## 2- netCDF format for climate data

Image courtesy of UCAR/Unidata

For more than 30 years, Unidata has been providing data, software tools, and support to enhance Earth-system education and research. The Unidata Program Center in Boulder, Colorado is the nexus of program activities.

## 2- netCDF format for climate data

Unidata is primarily sponsored by the National Science Foundation (NSF) and managed by the University Corporation for Atmospheric Research(UCAR).

Several organizations and groups of scientists from different countries have adopted netCDF as the standard method for representing certain scientific data (<https://www.unidata.ucar.edu/software/netcdf/conventions.html>).

ICTP is one of the organizations using netCDF for archiving and accessing some of their data.

## 2- netCDF format for climate data

### 2-c) Presentation of netCDF data

According to Unidata:

“ NetCDF (network Common Data Form) is a set of interfaces for array-oriented data access and a [freely](#) distributed collection of data access libraries for C, Fortran, C++, Java, and other languages. The netCDF libraries support a machine-independent format for representing scientific data. Together, the interfaces, libraries, and format support the creation, access, and sharing of scientific data.”

## 2- netCDF format for climate data

In conclusion, NetCDF is more than just a file format. In the simple view, netCDF is a:

- File format
- Application programming interface (API)
- Data model
- Library implementing the API

**NetCDF (Network Common Data Form) is a file format designed to support the creation of scientific data and the access to and sharing of such data. It is widely used among oceanographic and atmospheric communities to store variables such as temperature, pressure, wind speed and wave height.**

# 2- netCDF format for climate data

NetCDF data is: (extension .nc)

- ***Self-Describing***. A netCDF file includes information about the data it contains.
- ***Portable***. A netCDF file can be accessed by computers with different ways of storing integers, characters, and floating-point numbers.
- ***Scalable***. A small subset of a large dataset may be accessed efficiently.
- ***Appendable***. Data may be appended to a properly structured netCDF file without copying the dataset or redefining its structure.
- ***Sharable***. One writer and multiple readers may simultaneously access the same netCDF file.
- ***Archivable***. Access to all earlier forms of netCDF data will be supported by current and future versions of the software.

## 2- netCDF format for climate data

2-d) The Structure of NetCDF files (based on the "Classic" format)

NetCDF files are containers for Dimensions, Variables, and Global Attributes

A netCDF file has a **path name** and possibly some **dimensions, variables, global (file-level) attributes**, and **data values** associated with the variables. Sometimes we refer to netCDF files more abstractly as datasets.

## 2- netCDF format for climate data

### Variables

Variables hold data values. In the classic netCDF data model, a variable can hold a multidimensional array of values of the same type.

sst

relative\_humidity

time

# 2- netCDF format for climate data

## NetCDF Variables

NetCDF Variables have:

- A **type**, e.g. char (text character), byte (8 bits) or float (32 bits)
- A **shape**, specified by a list of dimensions, e.g.:
  - 1 dimension: a 1-D (vector) variable, such as time
  - 2 dimensions: a 2-D (grid or matrix) variable, such as surface\_pressure
- **Attributes** (optionally) – specifying properties such as long name and units.
- **Values** – the actual data values.

# 2- netCDF format for climate data

## Dimensions

Dimensions are used to specify variable shapes, common grids, and coordinate systems.

A dimension has a name and a length. Dimensions are used to define the shape of one or more variables in a netCDF file. In the classic netCDF data model, at most one dimension can have the unlimited length, which means variables can grow along that dimension. Record dimension is another term for an unlimited dimension.

# 2- netCDF format for climate data

## Attributes

Attributes hold metadata (data about data). An attribute contains information about properties of a variable or dataset.

Attributes can be “global” (applying to the whole file) or “variable attributes” (applying only to a specified variable).

# 2- netCDF format for climate data

## NetCDF data storage

The data in a NetCDF file is stored in table form.

For example, the variation of temperature over time at a location is stored as a one-dimensional array. The temperature above an area at a given time is stored as a two-dimensional array.

Three-dimensional (3D) data, such as the temperature over a region that varies over time, or four-dimensional (4D) (temperature over an area that varies over time and depending on the altitude) are stored as a series of two-dimensional arrays.

# 2- netCDF format for climate data

## NetCDF data storage

Three-dimensional data: data over an area that varies over time.

Four-dimensional data: data over an area that varies over time and according to altitude.

# 2- netCDF format for climate data

An easier way  
to view

## NetCDF: CDL

CDL (network  
Common Data  
form Language) is  
a human readable  
notation for  
netCDF objects  
and data.

```
netcdf filename {  
  dimensions:  
    lat = 3 ;  
    lon = 4 ;  
    time = UNLIMITED ; // (2 currently)  
  
  variables:  
    float lat(lat) ;  
      lat:long_name = "Latitude" ;  
      lat:units = "degrees_north" ;  
    float lon(lon) ;  
      lon:long_name = "Longitude" ;  
      lon:units = "degrees_east" ;  
    int time(time) ;  
      time:long_name = "Time" ;  
      time:units = "days since 1895-01-01" ;  
      time:calendar = "gregorian" ;  
    float rainfall(time, lat, lon) ;  
      rainfall:long_name = "Precipitation" ;  
      rainfall:units = "mm yr-1" ;  
      rainfall:missing_value = -9999.f ;  
  
  // global attributes:  
    :title = "Historical Climate Scenarios" ;  
    :Conventions = "CF-1.0" ;  
  
  data:  
    lat = 48.75, 48.25, 47.75 ;  
    lon = -124.25, -123.75, -123.25, -122.75 ;  
    time = 364, 730 ;  
    rainfall =  
      761, 1265, 2184, 1812, 1405, 688, 366, 269, 328, 455, 524, 877,  
      1019, 714, 865, 697, 927, 926, 1452, 626, 275, 221, 196, 223 ;  
}

“We do not inherit the Earth from our Ancestors, we borrow it from our Children”

## **3 Analysis and Processing of netCDF data**

# 3- Analysis and Processing of netCDF data

Operating on a NetCDF file. When working with a netCDF file you can:

- Create a new file, given its path name and whether to overwrite or not.
- Open an existing file for access, given dataset name and read or write intent.
- Add dimensions, variables, or attributes.
- Close a file, writing to disk if required.
- Get the number of dimensions, variables or global attributes.
- Get the unlimited dimension, if present.

# 3- Analysis and Processing of netCDF data

**cdo** stands for “Climate Data Operators”

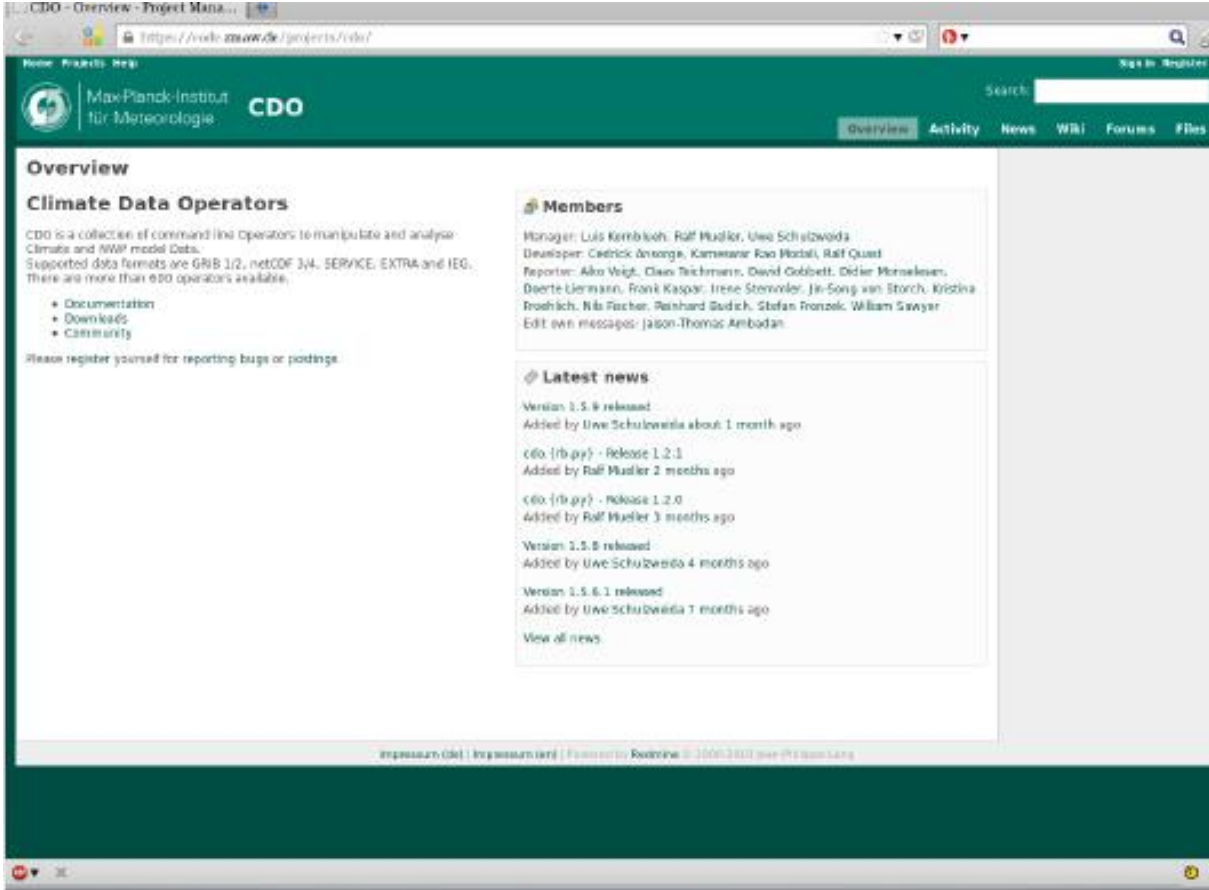

It is an extremely useful tool for both meteorologist and oceanographers and for everyone who uses .grib or netcdf files.

Cdo developed at Max-Planck Institut für Meteorologie, and  
It can be downloaded from `--- hSps://code.zmaw.de/ projects/cdo/`  
In the same site you can find detailed documentation and usage examples.

Also contained in most Linux distribution software.

# 3- Analysis and Processing of netCDF data

The screenshot shows the SourceForge project page for Climate Data Operators (CDO). The page has a green header with the project name and logo. Below the header, there's a navigation bar with links to Overview, Activity, News, Wiki, Forums, and Files. The main content area is divided into two columns. The left column contains the 'Overview' section, which describes CDO as a collection of command-line operators for manipulating and analyzing climate and NWP model data. It lists supported data formats (GRIB 1/2, netCDF 3/4, SERVICE, EXTRA, and IEG) and mentions that there are more than 600 operators available. Links for Documentation, Downloads, and Community are provided. A note asks users to register for reporting bugs or postings. The right column contains two sections: 'Members' and 'Latest news'. The 'Members' section lists the Manager (Luis Kernikow), Developer (Cedrick Anongba, Karmenar Koo Madadi, Ralf Quast), Reporter (Alko Veigt, Claus Trichmann, David Gobbett, Didier Monselesan, Dierke Liermann, Frank Kaspar, Irene Stemmler, Jai-Song van Storch, Kristina Trochlich, Nils Fischer, Reinhard Gudich, Stefan Tronzek, William Sawyer), and Editor-in-Chief (Jason-Thomas Amador). The 'Latest news' section lists several releases, including Version 1.5.9 released about 1 month ago, and Version 1.5.8 released 4 months ago. A 'View all news' link is at the bottom of this section. The footer of the page contains links to the project's homepage, source code, and a note about the project being powered by Redmine.

## Overview

### Climate Data Operators

CDO is a collection of command-line operators to manipulate and analyse climate and NWP model data.  
Supported data formats are GRIB 1/2, netCDF 3/4, SERVICE, EXTRA and IEG.  
There are more than 600 operators available.

# 3- Analysis and Processing of netCDF data

## A single command with hundreds of operators

- CDO was inspired by NCO – providing a range of climate data-related operations through the command-line
- Designed to operate on netCDF3/4, GRIB1/2 primarily
- Much functionality can be used for any NetCDF/gridded data
- Very efficient for specific tasks
- Manages memory effectively

# 3- Analysis and Processing of netCDF data

## CDO

- installation (ubuntu): `sudo apt-get install cdo`

- windows version (limited functionality):

`https://code.zmaw.de/attachments/download/8378/cdo-1.6.4-win32.zip`

- comprehensive documentation of the CDO available at:

`https://code.zmaw.de/projects/cdo/embedded/index.html`

- looks complex, but easy to use with basic understanding of CDO's functionality

### 3- Analysis and Processing of netCDF data

#### **CDO: a command-line tool**

CDO is a single command-line tool. It is used as follows:

```
$ cdo <operator> [options] <files>
```

# 3- Analysis and Processing of netCDF data

## Types of CDO Operator

File information and file operations

Selection and Comparison

Modification of metadata

Arithmetic operations

Statistical analysis

Regression and Interpolation

Vector and spectral Transformations

Formatted I/O

Climate indices

# 3- Analysis and Processing of netCDF data

## Many, many operators

**CDO breaks down its functionality into individual operators.**

There are over 650 at the time of writing this. For example:

`showstdname` Show standard names

`sellonlatbox` Select a longitude/latitude box

`setmissval` Set a new missing value

`monadd` Add monthly time series

`zonstd` Zonal standard deviation

`eca_hd` Heating degree days per time period

# 3- Analysis and Processing of netCDF data

## CDO – information operators

Quantities (variables) contained in a file:

```
$ cdo pardes INIOM_PD_echam5_main_mm_3901-4000_climatological_mean.nc
```

```
130  t          temperature [K]
131  u          u-velocity [m/s]
132  v          v-velocity [m/s]
133  q          specific humidity [kg/kg]
135  omega      vertical velocity [Pa/s]
155  sd        divergence [1/s]
156  geopot    geopotential height [m]
157  rhumidit  relative humidity
   85  tradl    net LW radiation 200mb [W/m^2]
   86  sradl    net SW radiation 200mb [W/m^2]
```

```
.
.
.
```

# 3- Analysis and Processing of netCDF data

## File Information

```
$ cdo infov ifile
```

This is an example result of a dataset with one 2D variable over 3 time steps:

-1	:	Date Time		Varname	Level	Size	Miss	:	Minimum	Mean	Maximum
1	:	1987-01-31 12:00:00	SST		0	2048	1361	:	232.77	266.65	305.31
2	:	1987-02-28 12:00:00	SST		0	2048	1361	:	233.64	267.11	307.15
3	:	1987-03-31 12:00:00	SST		0	2048	1361	:	225.31	267.52	307.67

# 3- Analysis and Processing of netCDF data

**File Operations** The full list of file operations covers:

Copying and concatenating

Merging fields/times

Splitting fields by variable/level/grid/time Some examples follow

### 3- Analysis and Processing of netCDF data

To copy a file and convert the output to NetCDF:

```
$ cdo -f nc copy ifile ofile.nc
```

To merge all files along the time axis:

```
$ cdo mergetime ifile1 ifile2 ifile3 ofile
```

# 3- Analysis and Processing of netCDF data

## **Selection**

**Data can be selected by a number of different methods including:**

Variable code, name or attribute

Levels

Time

Spatial region (latitude/longitude)

### 3- Analysis and Processing of netCDF data

**Selection** To select variables with ids: "SSTK" and "CI":

```
$ cdo selname,SSTK,CI infile.nc outfile.nc
```

To select a lat/lon bounding box:

```
$ cdo sellonlatbox,120,-90,20,-20 infile.nc  
outfile.nc
```

To select a date/time range:

```
$ cdo seldate,2014-12-12T12:00:00, 2015-01-  
31T18:00:00 infile.nc outfile.nc
```

# 3- Analysis and Processing of netCDF data

## Combining operators: example 1

For example, we can replace:

```
$ cdo timavg ifile1 tmp1  
$ cdo dayavg ifile2 tmp2  
$ cdo sub tmp2 tmp1 ofile  
$ rm tmp1 tmp2
```

With...

```
$ cdo sub -dayavg ifile2 -timavg ifile1 ofile
```

## 1 Background: Climate Modelling

## 2 netCDF format for climate data

## 3 Analysis and Processing of netCDF data

## 4 Visualisation of netCDF data

“We do not inherit the Earth from our Ancestors, we borrow it from our Children”

Emissions Reductions (RCP 2.6)

Continued Emissions Increases

## 4 Visualisation of netCDF data

Temperature Change (°F)

# 4- Visualisation of netCDF data

Special tools necessary for data analysis, plotting, inspection, ...

- UNIX has many tools available
  - viewers: ncview/panoply
  - translators: ncdump/ngen
  - **analysis tools**
- Windows
  - Some tools available, e.g. cygwin
  - But: reduced functionality

CDO

timesteps: 1200  
glob. avg. time: 287.6 K  
glob. max. time: 317.2 K

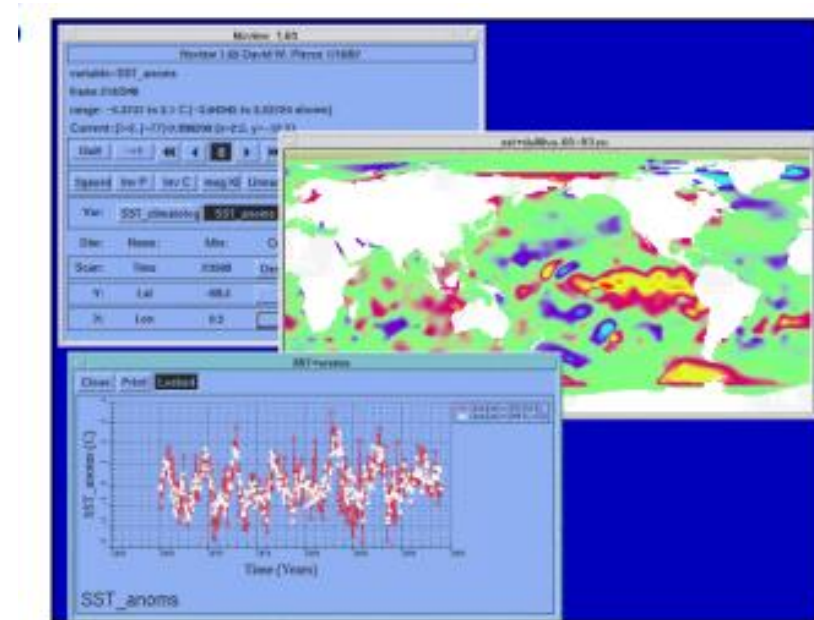

CDO

# 4- Visualisation of netCDF data

ncview:

- Visual browser for netCDF
- View simple animations along various dimensions
- Change look of graphs/maps

# 4- Visualisation of netCDF data

## Ncview – getting started

- To run ncview type:

```
$ ncview <data_file>
```

- E.g.:

```
$ ncview example_data/ggas2014121200_00-18.nc &
```

# 4- Visualisation of netCDF data

You are presented with:

- An information panel
- A control panel for visualization
- A variable selection panel
- Details of dimensions for the selected variable

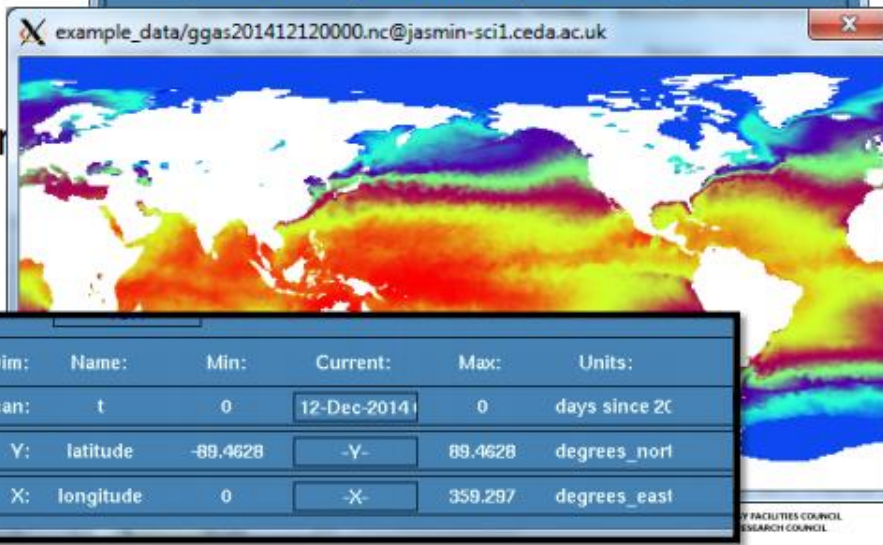

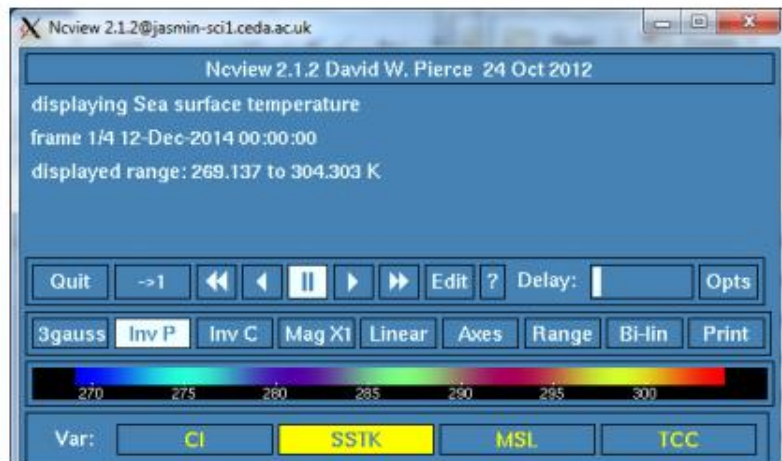

Select variable: in this case we have selected Sea Surface Temperature ("SSTK").

Ncview:

- displays information in the top panel
- Populates the colour bar
- Plots the first time step of the variable
- Displays information about dimensions

## 4- Visualisation of netCDF data

### ncview – animate

Use the animation panel to click through time steps or animate the plot.

Press the  button to run the animation. Adjust the "Delay" to slow it down.

## 4- Visualisation of netCDF data

### ncview – other options

The plotting panel has a range of useful functions that are best investigated by manually testing each.

E.g.: **3gauss**: click to select a different colour scale

**Inv P**: Invert the plot.

**Inv C**: Invert the colour scale

**Mag X1**: right/left click to zoom in/out

**Axes**: modify axes of plot

**Print**: print to a file or printer
