

SPRING SCHOOL ON SUPERSTRINGS AND RELATED MATTERS

18 - 26 March 2002

COVARIANT QUANTIZATION OF THE SUPERSTRING AND SUPERMEMBRANE

Lecture 3

N. BERKOVITS
Instituto de Fisica Teorica
Universidade Estadual Paulista
Sao Paulo
BRAZIL

Please note: These are preliminary notes intended for internal distribution only.

III. Quantization in R-R Backgrounds

III.A. Open superstring in super-Maxwell background

For bosonic string in Maxwell background,

$$S = \frac{1}{\alpha'} \int d\tau \frac{1}{2} \dot{X}^m \dot{X}_m + \int d\tau A_m(x) \dot{X}^m$$

can be used to obtain string corrections to Maxwell eq (Born-Infeld + α' corrections). Conf. inv \Rightarrow eqns of motion for $A_m(x)$.

For GS superstring in super-Maxwell background,

$$S_{GS} = \frac{1}{\alpha'} \int d\tau d\bar{\tau} \left(\frac{1}{2} \Pi^m \bar{\Pi}_m + B_{MN}^{flat} \partial Y^M \bar{\partial} Y^N \right) + \int d\tau \left(\partial \Theta^\alpha A_\alpha(x, \theta) + \Pi^m B_m(x, \theta) \right)$$

Under $\delta \Theta^\alpha = \xi^\alpha$, $\delta \bar{\Theta}^{\dot{\alpha}} = \bar{\xi}^{\dot{\alpha}}$, $\delta X^m = -\frac{1}{2} (\Theta \gamma^m \delta \Theta + \bar{\Theta} \gamma^m \delta \bar{\Theta})$

$$\delta S = \frac{1}{\alpha'} \int d\tau d\bar{\tau} \left[\xi^\alpha \bar{\Pi} \partial \Theta + \bar{\xi}^{\dot{\alpha}} \bar{\Pi} \partial \bar{\Theta} \right] + i \int d\tau \left[\xi^\alpha \bar{\Pi} W(x, \theta) \right.$$

$$\left. + \xi^\alpha \partial \Theta^\beta (D_\alpha A_\beta + D_\beta A_\alpha - \delta_{\alpha\beta}^m B_m) \right]$$

$$\Rightarrow \delta S = 0 \text{ if } \xi^\alpha = (\not{A} K)^\alpha, \bar{\xi}^{\dot{\alpha}} = (\bar{\not{A}} \bar{K})^{\dot{\alpha}}, D_\alpha A_\beta + D_\beta A_\alpha - \delta_{\alpha\beta}^m B_m = 0$$

\Rightarrow Inv. under K-symmetry if background is on-shell.

How to compute string corrections (supersymmetric Born-Infeld)?

Use pure spinor version of action:

$$\bar{S}_{pure} = \frac{1}{\alpha'} \int d\tau d\bar{\tau} \left(\frac{1}{2} \partial X^m \partial X_m + p_\alpha \bar{\partial} \Theta^\alpha + \bar{p}_{\dot{\alpha}} \partial \bar{\Theta}^{\dot{\alpha}} + "w_\alpha \bar{\partial} \lambda^\alpha" + " \bar{w}_{\dot{\alpha}} \partial \bar{\lambda}^{\dot{\alpha}} " \right)$$

$$+ \int d\tau \left(\partial \Theta^\alpha A_\alpha + \Pi^m B_m + d_\alpha W^\alpha + N^{mn} F_{mn} \right)$$

BRS invariance implies eqns. of motion for $(A_\alpha, B_m, W^\alpha, F_{mn})$

Quantum computations \Rightarrow superstring corrections

Can relate GS action and pure spinor action using BRST method of Oda and Tonin:

Under $Q + \bar{Q} = \int dz \lambda^\alpha d_\alpha + \int d\bar{z} \bar{\lambda}^{\dot{\alpha}} \bar{d}_{\dot{\alpha}}$: $\delta \theta^\alpha = \lambda^\alpha$, $\delta \bar{\theta}^{\dot{\alpha}} = \bar{\lambda}^{\dot{\alpha}}$,
 $\delta x^m = -\frac{i}{2} (\theta \gamma^m \delta \theta + \bar{\theta} \bar{\gamma}^m \delta \bar{\theta})$, $\delta d_\alpha = -\frac{i}{2} (\not{\lambda} \lambda)_\alpha$, $\delta \bar{d}_{\dot{\alpha}} = -i (\bar{\not{\lambda}} \bar{\lambda})_{\dot{\alpha}}$,
 $\delta \omega_\alpha = d_\alpha$, $\delta \bar{\omega}_{\dot{\alpha}} = \bar{d}_{\dot{\alpha}}$.

$Q^2 = \bar{Q}^2 = 0$ except on $\omega^\alpha, \bar{\omega}^{\dot{\alpha}}$: $Q^2 \omega_\alpha = -i (\not{\lambda} \lambda)_\alpha$, $\bar{Q}^2 \bar{\omega}_{\dot{\alpha}} = -i (\bar{\not{\lambda}} \bar{\lambda})_{\dot{\alpha}}$
 which is OK since it is a gauge transf. $\delta \omega_\alpha = (\gamma^m \lambda)_\alpha \Lambda_m$ and $\delta \bar{\omega}_{\dot{\alpha}} = (\bar{\gamma}^m \bar{\lambda})_{\dot{\alpha}} \bar{\Lambda}_m$

From κ -symmetry, $(Q + \bar{Q}) S_{GS} = \frac{2}{\alpha'} \int dz d\bar{z} [\lambda \not{\lambda} \partial \theta + \bar{\lambda} \bar{\not{\lambda}} \partial \bar{\theta}] + i \int d\tau \lambda \not{\lambda} W$
 $\Rightarrow S = S_{GS} + (Q + \bar{Q}) \left[\frac{1}{\alpha'} \int dz d\bar{z} [\omega \bar{\omega} \theta + \bar{\omega} \bar{\omega} \bar{\theta}] + \int d\tau \omega_\alpha W^\alpha \right]$
 is BRST-invariant

$\Rightarrow S = S_{GS} + \frac{1}{\alpha'} \int dz d\bar{z} [d_\alpha \bar{\omega} \theta^\alpha + \omega_\alpha \bar{d}^{\dot{\alpha}} \bar{\theta}^{\dot{\alpha}} + \bar{d}_{\dot{\alpha}} \omega \bar{\theta}^{\dot{\alpha}} + \omega_\alpha \bar{d}^{\dot{\alpha}} \bar{\theta}^{\dot{\alpha}}]$
 $+ \int d\tau (d_\alpha W^\alpha + \frac{1}{2} (\omega \gamma^{mn} \lambda) F_{mn})$
 = S_{pure}

III B. Closed superstring in supergravity background

$S_{GS} = \frac{1}{2\alpha'} \int dz d\bar{z} \left(\frac{1}{2} \eta_{ab} \pi^a \bar{\pi}^b + B_{MN} \partial Y^M \bar{\partial} Y^N \right)$

$\pi^a = (x^m, \theta^\alpha, \bar{\theta}^{\dot{\alpha}})$, $\pi^a = E^a_M \partial Y^M$, $\bar{\pi}^{\dot{a}} = E^{\dot{a}}_M \bar{\partial} Y^M$, $\partial_M B_{NP} = H_{MNP}$

$(E^a_M(x, \theta, \bar{\theta}), E^{\dot{a}}_M(x, \theta, \bar{\theta}), E^{\bar{a}}_M(x, \theta, \bar{\theta}))$ is $N=2 D=10$ super-vierbein

$M = (m, \mu, \bar{\mu})$ are curved indices, $A = (a, \alpha, \dot{\alpha})$ are tangent-space indices

On-shell, E^A_M and H_{MNP} are related. Dilaton φ and R-R fields appear in (E^A_M, H_{MNP}) with derivatives.

Classical action inv. under κ -symmetry when background on-shell.

How to compute α' corrections to eqns of motion?

Where is Fradkin-Tseytlin term $\int d^2z \varphi(x) r$?

To compute S_{pure} , use Oda-Tonin method:

In curved background, $\delta\theta^\alpha = \lambda^\alpha$, $\delta\bar{\theta}^{\dot{\alpha}} = \bar{\lambda}^{\dot{\alpha}}$, $\delta x^m = -\frac{i}{2}(\theta\gamma^m\delta\theta + \bar{\theta}\gamma^m\delta\bar{\theta})$

becomes $\delta Y^M = E^M_\alpha \lambda^\alpha + E^M_{\dot{\alpha}} \bar{\lambda}^{\dot{\alpha}}$.

Also, $\delta d_\alpha = -i(\not{\lambda})_\alpha$, $\delta \bar{d}_{\dot{\alpha}} = -i(\not{\bar{\lambda}})_{\dot{\alpha}}$, $\delta \omega_\alpha = d_\alpha$, $\delta \bar{\omega}_{\dot{\alpha}} = \bar{d}_{\dot{\alpha}}$

$$\Rightarrow (Q + \bar{Q}) S_{GS} = \frac{i}{\alpha'} \int d^2z d\bar{z} \left[(\lambda \not{\lambda})_\alpha E^M_\alpha \bar{\partial} Y^M + (\bar{\lambda} \not{\bar{\lambda}})_{\dot{\alpha}} E^M_{\dot{\alpha}} \partial Y^M \right]$$

$$\Rightarrow S = S_{GS} + \frac{i}{\alpha'} \int d^2z d\bar{z} \left[Q (w_\alpha E^M_\alpha \bar{\partial} Y^M) + \bar{Q} (\bar{w}_{\dot{\alpha}} E^M_{\dot{\alpha}} \partial Y^M) - Q \bar{Q} (w_\alpha \bar{w}_{\dot{\beta}} F^{\alpha\dot{\beta}}) \right]$$

is BRST invariant where the superspace torsion satisfies

$$T_{c\alpha}^{\dot{\beta}} = \gamma_{c\alpha\dot{\beta}} F^{\delta\dot{\beta}} \quad \text{and} \quad T_{c\dot{\alpha}}^\beta = -\gamma_{c\dot{\alpha}\beta} F^{\beta\dot{\delta}}$$

$$S_0 \bar{Q} (E^M_\alpha \bar{\partial} Y^M) = \bar{\lambda}^{\dot{\beta}} T_{c\dot{\beta}}^\alpha \bar{\pi}^c = -(\bar{\lambda} \not{\bar{\lambda}})_{\dot{\beta}} F^{\alpha\dot{\beta}}$$

$$\text{and } Q (E^M_{\dot{\alpha}} \partial Y^M) = \lambda^\beta T_{c\beta}^{\dot{\alpha}} \pi^c = (\lambda \not{\lambda})_\alpha F^{\alpha\dot{\beta}}$$

$\theta = \bar{\theta} = 0$ component of $F^{\alpha\dot{\beta}}$ is $e^\varphi f^{\alpha\dot{\beta}}$ where $f^{\alpha\dot{\beta}}$ is

R-R field strength,

$$\Rightarrow S_{\text{pure}} = \frac{i}{\alpha'} \int d^2z d\bar{z} \left[\frac{1}{2} \gamma_{ab} \pi^a \bar{\pi}^b + B_{MN} \partial Y^M \bar{\partial} Y^N + d_\alpha E^M_\alpha \bar{\partial} Y^M + \bar{d}_{\dot{\alpha}} E^M_{\dot{\alpha}} \partial Y^M + w_\alpha \bar{\nabla} \lambda^\alpha + \bar{w}_{\dot{\alpha}} \nabla \bar{\lambda}^{\dot{\alpha}} + d_\alpha \bar{d}_{\dot{\beta}} F^{\alpha\dot{\beta}} + d_\alpha \bar{N}_{ab} C^{\alpha ab} + \bar{d}_{\dot{\alpha}} N_{ab} \bar{C}^{\dot{\alpha} ab} \right.$$

$$\text{where } \bar{\nabla} \lambda^\alpha = \bar{\partial} \lambda^\alpha + \Omega_M^{cd} (\gamma_{cd})^\alpha \bar{\partial} Y^M$$

$$\nabla \bar{\lambda}^{\dot{\alpha}} = \partial \bar{\lambda}^{\dot{\alpha}} + \bar{\Omega}_M^{cd} (\gamma_{cd})^{\dot{\alpha}} \partial Y^M$$

$$+ N_{ab} \bar{N}_{cd} R^{abcd} \left. \right]$$

$$C^{\alpha ab} = (\gamma^{ab})^\alpha_{\dot{\beta}} \nabla_{\dot{\gamma}} F^{\alpha\dot{\beta}}$$

$$\bar{C}^{\dot{\alpha} ab} = (\gamma^{ab})^{\dot{\gamma}}_\beta \nabla_\gamma F^{\beta\dot{\alpha}}$$

After including the F-T term $\int d^2z d\bar{z} \Phi r$, can check that

$\lambda^\alpha d_\alpha$ is nilpotent and holomorphic when background superfields are on-shell. Fradkin-Tseytlin term is needed at one-loop order (hep-th/0112160 with Paul Howe)

III.C. Superstring in $AdS_5 \times S^5$ background

In $AdS_5 \times S^5$ background, E^A_M can be constructed using Metsaev-Tseytlin currents.

$$\text{Define } g(x, \theta, \bar{\theta}) = \exp(x^c P_c + \theta^\alpha Q_\alpha + \bar{\theta}^{\bar{\alpha}} Q_{\bar{\alpha}})$$

$$\text{where } \{Q_\alpha, Q_\beta\} = \gamma_{\alpha\beta}^c P_c, \quad \{Q_{\bar{\alpha}}, Q_{\bar{\beta}}\} = \gamma_{\bar{\alpha}\bar{\beta}}^c P_c$$

$$[P^c, P^d] = R^{cdef} J_{ef}, \quad [Q_\alpha, P_c] = \gamma_{c\alpha\beta} F^{\beta\bar{\gamma}} Q_{\bar{\gamma}}$$

$$[Q_{\bar{\alpha}}, P_c] = \gamma_{c\bar{\alpha}\bar{\beta}} F^{\bar{\gamma}\beta} Q_\beta, \quad \{Q_\alpha, Q_{\bar{\gamma}}\} = J_{cd} \gamma_{\alpha\beta}^c F^{\beta\bar{\gamma}} \gamma^d_{\bar{\delta}\bar{\gamma}}$$

and J_{ab} generates $SO(4,1) \times SO(5)$ Lorentz algebra.

$$F^{\alpha\bar{\beta}} = \frac{1}{ng} (\gamma^{01234})^{\alpha\bar{\beta}} \quad \text{self-dual R-R field strength}$$

$$R^{cdef} = \pm \gamma^{c[e} \gamma^{f]d} \quad \text{when } (c,d,e,f) \rightarrow [0, \dots, 4] \\ \rightarrow [5, \dots, 9]$$

$$\text{Then } g^{-1} \partial g = P_c E^c_M \partial Y^M + Q_\alpha E^\alpha_M \partial Y^M + Q_{\bar{\alpha}} E^{\bar{\alpha}}_M \partial Y^M \\ + J_{cd} \omega_M^{cd} \partial Y^M$$

$$S_{GS} = \int d^2z \left(\frac{1}{2} \gamma_{cd} E^c \bar{E}^d + 2 F_{\alpha\bar{\beta}}^{-1} (E^\alpha \bar{E}^{\bar{\beta}} - \bar{E}^\alpha E^{\bar{\beta}}) \right)$$

$$+ B_{MN} (\partial Y^M \bar{\partial} Y^N - \bar{\partial} Y^M \partial Y^N)$$

$$S_{\text{pure}} = S_{\text{GS}} + \frac{1}{\alpha'} \int d^2 z \left[d_\alpha \bar{E}^\alpha + \bar{d}_{\bar{\alpha}} E^{\bar{\alpha}} + w_\alpha \bar{\nabla} \lambda^\alpha + \bar{w}_{\bar{\alpha}} \nabla \bar{\lambda}^{\bar{\alpha}} + d_\alpha \bar{d}_{\bar{\beta}} F^{\alpha\bar{\beta}} + N_{ab} \bar{N}_{cd} R^{abcd} \right] \quad -16-$$

($AdS_3 \times S^3$ w/ Vafa, Witten ; $AdS_2 \times S^2$ w/ Bershadsky, Hauer, Zukov, Zwickbach ; $AdS_5 \times S^5$ w/ Chandia

Integrate out d_α and $\bar{d}_{\bar{\beta}}$:

$$S_{\text{pure}} = \frac{1}{\alpha'} \int d^2 z \left(\frac{1}{2} \eta_{cd} E^c E^d + F_{\alpha\bar{\beta}}^{-1} (3E^\alpha \bar{E}^{\bar{\beta}} - \bar{E}^\alpha E^{\bar{\beta}}) \right) + S_{\text{ghost}}$$

K-symmetry is replaced with BRST invariance.

Quantization is straightforward using normal coordinate expansion.

One-loop conformal invariance proven (not yet for S_{ghost})

by Feynman diagram computation in $AdS_2 \times S^2$ paper.

III. D. Superstring in R-R plane wave background (to appear soon)

Can take Penrose limit of $AdS_5 \times S^5$ background $\Rightarrow F^{\alpha\bar{\beta}} = \mu (\gamma^{+1234})^{\alpha\bar{\beta}}$

$\Rightarrow F^{\alpha\bar{\beta}}$ is not invertible. Break $SO(9,1) \rightarrow SO(8)$

$\alpha \rightarrow (a, \dot{a})$ and $\bar{\alpha} \rightarrow (\bar{a}, \dot{\bar{a}})$, $F^{a\dot{b}} = F^{\dot{a}\bar{b}} = F^{\dot{a}\dot{\bar{b}}} = 0$

To prove conf. inv. of S_{pure} , first consider S_{pure} at $\theta^{\dot{a}} = \bar{\theta}^{\dot{\bar{a}}} = 0$

$$S_{\text{pure}} \Big|_{\theta^{\dot{a}} = \bar{\theta}^{\dot{\bar{a}}} = 0} = S_{\text{GS}} \Big|_{\theta^{\dot{a}} = \bar{\theta}^{\dot{\bar{a}}} = 0} + \frac{1}{\alpha'} \int d^2 z \left[d_a \bar{E}^a + \bar{d}_{\bar{a}} E^{\bar{a}} + d_a \bar{d}_{\bar{b}} F^{a\bar{b}} + w_\alpha \bar{\nabla} \lambda^\alpha + \bar{w}_{\bar{\alpha}} \nabla \bar{\lambda}^{\bar{\alpha}} + N_{+b} \bar{N}_{+c} \zeta^{bc} \right]$$

$$= \int d^2 z \left(\frac{1}{2} \eta_{cd} E^c E^d + F_{ab}^{-1} (3E^a \bar{E}^{\bar{b}} - \bar{E}^a E^{\bar{b}}) \right) + S_{\text{ghost}}$$

\Rightarrow one-loop conformal invariant. But can easily show there are no multiloop Feynman diagrams \Rightarrow inv. at all loops.

But isometries imply S_{pure} is conf. inv. if $S_{\text{pure}} \Big|_{\theta^{\dot{a}} = \bar{\theta}^{\dot{\bar{a}}} = 0}$ is conf. inv.

IV. Covariant Quantization of D=11 Superparticle and Supermembrane

IV.A. On-shell D=11 Supergravity in superspace

$$(x^r, \theta^\mu) \quad r=1 \text{ to } 11 \quad (x^{10} = \text{time}), \quad \mu=1 \text{ to } 32$$

$$\Gamma_{\mu\nu}^r = \Gamma_{\nu\mu}^r, \quad \text{Can use } C^{\mu\nu} = -C^{\nu\mu} \text{ and } C_{\mu\nu} = -C_{\nu\mu} \text{ to}$$

raise and lower D=11 spinor indices.

$$f^{(\mu\nu)} = f^r \Gamma_r^{\mu\nu} + f^{rs} \Gamma_{rs}^{\mu\nu} + f^{rstuv} \Gamma_{rstuv}^{\mu\nu}$$

$$f_{[\mu\nu]} = f C^{\mu\nu} + f^{rst} \Gamma_{rst}^{\mu\nu} + f^{rstu} \Gamma_{rstu}^{\mu\nu}$$

$$\eta_{rs} \Gamma_{(\mu\nu)}^r \Gamma_{(\rho\sigma)}^s = 0$$

D=11 supergravity fields $g_{rs}, b_{rst}, \chi_r^\mu$ are described on-shell by superfields

$$E_m^A(x, \theta), \quad B_{MNP}(x, \theta) \text{ where } M = (m, \mu)$$

Just as $A_\alpha(x, \theta)$ contains all D=10 super-Maxwell fields,

$B_{\mu\nu\rho}(x, \theta)$ contains all D=11 supergravity fields.

Eq. of motion: $D_\alpha A_\beta = \gamma_{\alpha\beta}^m A_m \rightarrow D_{(\mu} B_{\nu\rho)} = \Gamma_{(\mu\nu}^r B_{\rho)r} \quad (\text{Cederwall, et al})$

Gauge inv.: $\delta A_\alpha = D_\alpha \Lambda \rightarrow \delta B_{\mu\nu\rho} = D_{(\mu} \Lambda_{\nu\rho)}$

\Rightarrow Can gauge $B_{\mu\nu\rho}(x, \theta) = (\Gamma^r \theta)_\mu (\Gamma^s \theta)_\nu (\Gamma^t \theta)_\rho b_{rst}(x) + (\Gamma^r \theta)_\mu (\Gamma^{st} \theta)_\nu (\Gamma \theta)_\rho g_{rst}(x)$
 $+ [(\Gamma^r \theta)_\mu (\Gamma^s \theta)_\nu (\Gamma^t \theta)_\rho (\Gamma_{st} \theta)_\sigma - (\Gamma^r \theta)_\mu (\Gamma^{st} \theta)_\nu (\Gamma_s \theta)_\rho (\Gamma_t \theta)_\sigma] \chi_r^\sigma(x)$
 $+ \dots$ where ... is determined by $(b_{rst}, g_{rst}, \chi_r^\sigma)$

Also, these component fields are all on-shell.

Brink-Schwarz: $S = \int d\tau (\pi^r P_r + e P^r P_r)$, $\pi^r = \dot{x}^r - \frac{i}{2} \dot{\theta} \Gamma^r \theta$

Inv. under κ -symmetry, $p_m = -\frac{i}{2} (\not{P} \theta)_m \Rightarrow d_m = p_m + \frac{i}{2} (\not{P} \theta)_m = 0$

$\{d_\mu, d_\nu\} = i P_r \Gamma_{\mu\nu}^r \Rightarrow 16$ first-class and 16 second-class

Can quantize in light-cone gauge and get linearized $D=11$ supergravity

[Note error in lecture I]

Pure spinor action: $S = \int d\tau (\dot{x}^r P_r - \frac{1}{2} \dot{P}^r P_r + \dot{\theta}^\mu p_\mu + \lambda^\mu \omega_\mu)$
 $= \int d\tau (\frac{1}{2} \dot{x}^r \dot{x}_r + \dot{\theta}^\mu p_\mu + \lambda^\mu \omega_\mu)$

BRST operator: $Q = \lambda^\mu d_\mu$, $\lambda \Gamma^r \lambda = 0$ for $r=1$ to 11 .

decompose
in $SO(9,1)$
components

$$\lambda \Gamma^r \lambda = 0 \rightarrow \lambda^\alpha \gamma_{\alpha\beta}^m \lambda^\beta + \bar{\lambda}_\alpha \gamma^{\alpha\beta m} \bar{\lambda}_\beta = 0 \quad \lambda^\mu \rightarrow \lambda^\alpha$$

$$\rightarrow \lambda^\alpha \bar{\lambda}_\alpha = 0 \quad \bar{\lambda}_\alpha$$

$$\Rightarrow \bar{\lambda}_\alpha \gamma^{\alpha\beta m} \bar{\lambda}_\beta = -\lambda^\alpha \gamma_{\alpha\beta}^m \lambda^\beta \Rightarrow 9 \text{ constraints on } \bar{\lambda}_\alpha$$

$$\gamma_{rs} \Gamma_{(mp}^r \Gamma_{\sigma\nu)}^{st} = 0 \Rightarrow \gamma_{rs} (\lambda \Gamma^r \lambda) (\lambda \Gamma^{st} \lambda) = 0$$

$$\text{So } \lambda \Gamma^m \lambda = 0 \Rightarrow (\lambda \Gamma^{11} \lambda) (\lambda \Gamma^{m11} \lambda) = -(\lambda \Gamma^m \lambda) (\lambda \Gamma^{m11} \lambda) = 0$$

\Rightarrow Either $\lambda \Gamma^{11} \lambda = 0$ or $\lambda \Gamma^{m11} \lambda = 0$ for $t=1$ to 10

Generically, get $\lambda \Gamma^{11} \lambda = 0 \Rightarrow \lambda^\mu$ has 23 independent components

$$\text{Light-cone} = \begin{matrix} 32 & + & 32 & - & 23 & - & 23 & \text{fermions} & = & 18 & \text{fermions} \\ \theta^\mu & & p_m & & \lambda^\mu & & \omega_m & & & & = 16 \text{ light-cone} + (b, c) \end{matrix}$$

Can dim. reduce at $P_{11} = 0$ to $N=2$ $D=10$ superparticle

$$S = \int d\tau (\dot{x}^m P_m - \frac{1}{2} P^m P_m + \dot{\theta}^\alpha p_\alpha + \dot{\bar{\theta}}_\alpha \bar{p}^\alpha + \lambda^\alpha \omega_\alpha + \bar{\lambda}^\alpha \bar{\omega}_\alpha)$$

$$Q = \lambda^\alpha d_\alpha + \bar{\lambda}_\alpha \bar{d}^\alpha$$

But this version of $N=2$ $d=10$ superparticle is different from naive infinite tension limit of Type IIB superstring since $\lambda \gamma^m \lambda - \bar{\lambda} \gamma^m \bar{\lambda} = \lambda \Gamma^{mn} \lambda \neq 0$. Have chosen "other" branch of $\lambda \Gamma^m \lambda = 0$ constraint where $\lambda \Gamma^{mn} \lambda = \lambda^\alpha \bar{\lambda}_\alpha = 0$. In naive limit, light cone $\Rightarrow 64 - 2(22) = 20$ fermion = 16 light-cone + $(b, c) + (\bar{b}, \bar{c})$. Still need to impose $b - \bar{b} = 0$ constraint to get zero mom. dilaton and R-R gauge fields

IVc. BRST quantization of linearized D=11 Supergravity

Define physical states = cohom. of $Q = \lambda^\mu d_\mu$ at ghost-number three ($d=3$ worldvol. of supermembrane)

$$\Psi(\lambda, x, \theta) = \lambda^\mu \lambda^\nu \lambda^\rho B_{\mu\nu\rho}(x, \theta)$$

$$Q\Psi = 0 \Rightarrow \lambda^\mu \lambda^\nu \lambda^\rho \lambda^\sigma D_\sigma B_{\mu\nu\rho} = 0 \Rightarrow D_\sigma B_{\mu\nu\rho} = \Gamma_{(\sigma\mu}^r B_{\nu\rho)r}$$

$$\delta\Psi = Q(\lambda^\mu \lambda^\nu \lambda_{\mu\nu}) = \lambda^\mu \lambda^\nu \lambda^\rho D_\rho \lambda_{\mu\nu} \Rightarrow \delta B_{\mu\nu\rho} = D_{[\mu} \lambda_{\nu\rho]} \quad \text{for some } B_{\nu\rho r}$$

$\Rightarrow B_{\mu\nu\rho}(x, \theta)$ describes (linearized) D=11 supergravity

At other ghost numbers, cohom. of Q gives (ghosts, fields, antifields, antighost)

At zero momentum, $\Psi(\lambda, \theta) = \omega'' + (\lambda\theta)^r \omega_r' + (\lambda^2\theta^2)^{[rs]} \omega_{rs} + (\lambda^2\theta^2)^r p_r$
 $+ (\lambda^2\theta^3)^m \xi_m + (\lambda^3\theta^3)^{[rst]} b_{rst} + (\lambda^3\theta^3)^{[rs]} g_{rs} + (\lambda^3\theta^4)^{r\alpha} \chi_{r\alpha}$
 $+ (\lambda^4\theta^5)^{r\alpha} \chi_{r\alpha}^* + (\lambda^4\theta^6)^{[rs]} g_{rs}^* + (\lambda^4\theta^6)^{[rst]} b_{rst}^*$
 $+ (\lambda^5\theta^6)^m \xi_m^* + (\lambda^5\theta^7)^r p_r^* + (\lambda^5\theta^7)^{[rs]} \omega_{rs}^* + (\lambda^6\theta^8)^r \omega_r^* + (\lambda^7\theta^9) \omega^*$

$(\omega_{rs}, p_r, \xi_m)$ ghosts for $\delta b_{rst} = \partial_r \lambda_{st}$, $\delta g_{rs} = \partial_r \lambda_s$, $\delta \chi_{r\alpha} = \partial_r \xi_\alpha$
 ω_r^* ghost-for-ghost $\delta \lambda_{st} = \partial_s \lambda_t^*$, ω'' ghost-for-ghost-for-ghost $\delta \lambda_t^* = \partial_t \omega''$

Can define BV action for linearized D=11 supergravity

$$S = \int d^{11}x \langle \Psi(\lambda, x, \theta) Q \Psi(\lambda, x, \theta) \rangle \text{ where } \langle \lambda^7 \theta^9 \rangle = 1.$$

IV. D. BST action for supermembrane

$$S_{BST} = \int d\tau d\sigma^2 \left[\frac{1}{2} \hat{\pi}_0^r \hat{\pi}_{0r} + B_{RST}^{flat} \partial_0 Y^R \partial_1 Y^S \partial_2 Y^T \right]$$

$$Y^R = (x^r, \theta^M)$$

with Hamiltonian $\hat{\pi}_0^r \hat{\pi}_{0r} = \det(\pi_{IJ}^r \pi_{Jr})$ $I, J = 1, 2$

$$\hat{\pi}_0^r = \pi_0^r + e^J \pi_J^r$$

$$\pi^r = \partial x^r + \frac{i}{2} \theta \Gamma^r \partial \theta$$

Have gauge fixed $e^0 = 1$, but left e^J unfixed (spatial reparam's).

Under $\delta \theta^M = \xi^M$, $\delta x^r = -\frac{i}{2} (\theta \Gamma^r \delta \theta)$, $\delta e^J = i \xi_M (\partial_I \theta^M) \epsilon^{IJ}$,

$$\delta S_{BST} = i \int d\tau d\sigma^2 \xi^M \left(\Gamma_{\mu\nu}^r \hat{\pi}_{0r} - \frac{1}{2} \Gamma_{\mu\nu}^{rs} \pi_{Ir} \pi_{Js} \epsilon^{IJ} \right) \nabla \theta^M$$

where $\nabla \theta^M = \hat{\partial}_0 \theta^M + \Gamma_r^{\mu\nu} (\partial_I \theta^M) \pi_J^r \epsilon^{IJ}$

$$\Rightarrow \delta S_{BST} = 0 \text{ if } \xi_M = \left(\Gamma_{\mu\nu}^r \hat{\pi}_{0r} + \frac{1}{2} \Gamma_{\mu\nu}^{rs} \pi_{Ir} \pi_{Js} \epsilon^{IJ} \right) K^\nu$$

up to reparam. constraints.

$$d_\mu = p_\mu - \frac{\partial L}{\partial \dot{\theta}^\mu} \approx 0, \quad \{d_\mu, d_\nu\} = -\hat{\pi}_{0r} \Gamma_{\mu\nu}^r + \frac{1}{2} \epsilon^{IJ} \pi_{Ir} \pi_{Js} \Gamma_{\mu\nu}^{rs}$$

\Rightarrow 16 first-class and 16 second-class constraints.

Two new features: 1) $\delta e^J \neq 0$; 2) $\{d_\mu, d_\nu\}$ has term with $\Gamma_{\mu\nu}^{rs}$.

To get pure spinor action, use Oda-Tonin method and compute BRST transf. of S_{BST} under $Q = \int \lambda^M d_\mu$

$$\Rightarrow \delta \theta^M = \lambda^M, \quad \delta x^r = -\frac{i}{2} (\theta \Gamma^r \delta \theta), \quad \delta d_\mu = -i \left(\hat{\pi} \lambda \right)_\mu + \frac{i}{2} \epsilon^{IJ} \pi_{Ir} \pi_{Js} \left(\Gamma_{\mu\nu}^{rs} \lambda \right)_\nu, \quad \delta \omega_\mu = d_\mu$$

IV.E. Pure spinor version of supermembrane action -21-

Two new features \Rightarrow 1) Define $\delta e^J = i \zeta_M (\partial_I \theta^M) \in \mathbb{I}^J$

2) $\lambda \Gamma^r \lambda = 0$ is not enough to guarantee nilpotence of Q

since $Q^2 = \int \lambda^M \lambda^N \{ \partial_M, \partial_N \} = \int \lambda^M \lambda^N \left(-\hat{\Pi}_{0r} \Gamma^r + \frac{1}{2} \Pi_{I\bar{r}} \Pi_{\bar{r}S} \Gamma^{rs} \right) \in \mathbb{I}^J$

and $Q^2 \neq 0 \Rightarrow$ Need to impose $(\lambda \Gamma^{rs} \lambda) \Pi_{\bar{r}S} = 0$ and $\lambda^M \partial_J \lambda_M = 0$

Not visible for superparticle where $\Pi_{\bar{r}S} = \partial_J \lambda^M = 0$

$\Rightarrow S_{\text{pure}} = S_{\text{BST}} + \int d\sigma d\sigma^2 Q (\omega_M \nabla \theta^M)$

$= \int d\sigma d\sigma^2 \left(\hat{\Pi}_0^r \hat{\Pi}_{0r} + B_{\text{RST}}^{\text{flat}} \partial_0 Y^R \partial_1 Y^S \partial_2 Y^T \right)$

$+ d_M \nabla \theta^M + \omega_M \nabla \lambda^M$

$+ i \epsilon^{\mathbb{I}^J} \left[(\omega \Gamma^r \partial_I \theta) (\lambda \Gamma_r \partial_J \theta) - (\omega \partial_I \theta) (\lambda \partial_J \theta) \right]$

Can be generalized to a curved background by replacing

$\nabla \theta^M$ and $\partial_J \theta^M$ with $E_M^\alpha \nabla Y^M$ and $E_M^\alpha \partial_J Y^M$,

$\Pi^r \rightarrow E_M^c \partial Y^M$, $B_{\text{BST}}^{\text{flat}} \rightarrow B_{\text{BST}}$.

Upon double-dimensional reduction, $S_{\text{pure}}^{\text{flat}} \rightarrow S_{\text{pure}}^{\text{flat IIA}}$

$\partial_2 X^{\bar{r}} = 1, \partial_2 \theta^M = \partial_2 X^M = 0$

But $S_{\text{pure}}^{\text{curved}} \not\rightarrow S_{\text{pure}}^{\text{curved IIA}}$. No Fradkin-Tseytlin term

in $D=11$ and no $d_\alpha \bar{d}_{\bar{\beta}} F^{\alpha\bar{\beta}}$ term.

But $S_{\text{pure}}^{\text{curved IIA}}$ only well-defined for small coupling constant.

No reason to agree with $S_{\text{pure}}^{\text{membrane}}$ non-perturbatively.

Can S_{pure} be used to compute non-perturbative IIA amplitudes?

VIF. Speculations on connection with M-theory ⁻²²⁻

To compute amplitudes, need vertex operators. Massless integrated vertex operator $\int d^2\sigma V$ is linear contribution to curved action. BRST invariance implies

$$QV = \partial_A W^A \text{ for } A = \tau, \sigma_1, \sigma_2;$$

$$Q^2 V = 0 \Rightarrow QW^A = \epsilon^{ABC} \partial_B X_C; \quad Q^2 W^A = 0 \Rightarrow QX_C = \partial_C U$$

where $U = \lambda^\mu \lambda^\nu \lambda^\rho B_{\mu\nu\rho}$. So $d=3$ worldvolume implies U has ghost-number three for physical fields.

$$\langle \lambda^7 \theta^9 \rangle = 1 \Rightarrow +7 \text{ ghost number anomaly}$$

Can define non-vanishing "tree" amplitudes as

$$\langle U_1 U_2^* \int V_3 \dots \int V_N \rangle \text{ where } U^* \text{ carries g.n.} = 4 \text{ and depends on antifields.}$$

$$U_1 \frac{\int V_3 \dots \int V_N}{U_2^*}$$

In string theory, gives correct answer up to infinite $SL(2, \mathbb{R})$ factor.

Why just tree amplitudes? Supermembrane action needs to be regularized (cutoff, discretization, M(atrix) theory). Since supermembranes allow "spikes", cutoff destroys topology and cannot distinguish trees from loops. No dimensionless parameter in $D=11$ supergravity.

Using pure spinors, should be possible to covariantize light-cone quantization methods such as M(atrix) theory or light cone superparticle methods. Maybe can do perturbative expansion in $\frac{1}{\text{tension}}$ and hope that results are cutoff independent.
