WORKSHOP ON PATTERN RECOGNITION AND ANALYSIS OF SEISMICITY

(5 - 16 December 1983)

PATTERN B ("BURST OF AFTERSHOCKS")
A LONG-TERM PREMONITORY SEISMICITY PATTERN

A.M. GABRIELOV
I.M. ROTWAIN

These are negligibles, ensure the control forced a only in this elbetter to participants, where the control of 91 ± 0.00

Court St. Combined Special Leady of Charles

PATTERN E ("BURST OF AFTERSHOOKS") A LONG-TERM PREMONITORY SEISMICITY PATTERN INTRODUCTORY LECTURE

NOTE: THIS IS ONE OF SEVERAL PREMONITORY SEISMICITY PATTERNS.

IT IS RELATIVELY BETTER (BUT NOT FINALLY) CHECKED.

HERE WE GIVE THE KNOW-HOW IN RESEARCH (ANALYSIS OF EXISTING CATALOGS) BUT NOT THE READY RECIPE FOR ROUTINE PREDICTION.

OBSERVED_PHENOMENA: A STRONG EARTHQUAKE IS PRECEDED BY

A GROUP OF WEAKER EARTHQUAKES CONCENTRATED IN SPACE-TIME.

USUALLY IT IS A MAIN SHOCK WITH ABNORMALLY LARGE

NUMBER OF AFTERSHOCKS ("BURST OF AFTERSHOCKS").

IS IT RELIABLE AND USEFUL FOR PREDICTION? TO ANSWER, WE NEED:

TO GIVE A FORMAL (REPRODUCIBLE AND UNAMBIGUOUS)
DEFINITION OF THE BURST OF AFTERSHOCKS.

USING THIS DEFINITION - TO MAKE "RETROSPECTIVE
PREDICTION, THAT IS TO COMPARE BURSTS OF
AFTERSHOCKS AND STRONG EARTHQUAKES IN THE PAST.

TO ATTEMPT FORWARD PREDICTION BY MONITORING
NEW BURSTS OF AFTERSHOCKS.

HOW TO DEFINE MAIN SHOCKS AND THEIR AFTERSECCKS IN THE CATALOG?

EARTHQUAKES IN THE CATALOG ARE GIVEN AS $(t_i, Y_i, \lambda_i, h_i, M_i)$,

i - SEQUENCE NUMBER,

t - ORIGIN TIME $(t_i \geqslant t_{i-1})$,

 (φ,λ) - EPICENTER,

h - DEPTH,

M - MAGNITUDE

DEFINITION: EARTHQUAKE WITH NUMBER j IS AN AFTERSHOCK
OF THE EARTHQUAKE WITH NUMBER i (j > i) IF:

$$\begin{split} & t_j - t_i \leqslant T(M_i), \\ & \left| h_j - h_i \right| \leqslant H(M_i), \\ & \text{THE DISTANCE BETWEEN THEIR EPICENTERS IS} \leqslant R(M_i), \\ & M_j \leqslant M_i. \end{split}$$

PROCEDURE:

THE FIRST EARTHQUAKE IN THE CATALOG IS A MAIN SHOCK.

ITS AFTERSHOCKS ARE EXCLUDED FROM THE CATALOG.

THE FIRST OF REMAINING EARTHQUAKES IS SECOND

MAIN SHOCK ETC.

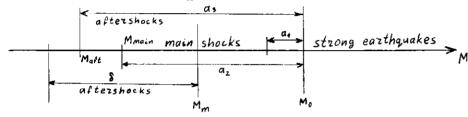

PATTERN B - FORMAL DEFINITION.

STRONG EARTHQUAKES: $M \gg M_0$; WE ARE LOOKING FOR THEIR PRECURSORS.

MAIN SHOCKS: $M_0 - a_2 = M_{main} \leq M \leq M_0 - a_1$

<u>AFTERSHOCKS</u>: $M_0 - a_3 = M_{aft} \le M \le M_m$, $(or M_m - S \le M \le M_m)$

WHERE $M_{\rm m}$ IS MAGNITUDE OF MAIN SHOCK

b = b(e) - Number of Aftershocks in first e days

After main shock

PATTERN B: b ≥ B

TIME OF INCREASED PROBABILITY OF STRONG EARTHQUAKE (TIP):

STARTS WHEN PATTERN B APPEARS,

ENDS WHEN A STRONG EARTHQUAKE OCCURES OR T YEARS EXPIRE.

ERRORS: FAISE ALARM - PATTERN B NOT FOLLOWED BY A STRONG
EARTHQUAKE WITHIN T YEARS,

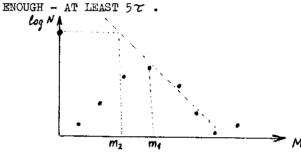

FAILURE TO PREDICT - STRONG EARTHQUAKE NOT

PRECEDED BY A PATTERN B WITHIN T YEARS.

FREE DECISIONS

REGION: BOUNDARIES SHOULD NOT CROSS DENSE CLOUDS OF EPICENTERS, NOR BE CLOSE TO EPICENTERS OF STRONG EARTHQUAKES.

CATALOG: SHOULD BE COMPLETE FOR MINIMAL MAGNITUDE OF AFTERSHOCKS $M_{aft}(or\ M_{main}-\ \delta)$ During some Time-period. This period should be long

CATALOG IS COMPLETE FOR $M \geqslant m_{f^*}$ SOMETIMES UNIDENTIFIED MAGNITUDES (O ON TAPE) CAN BE REPLACED BY m_{f^*} .

MAGNITUDES: BEWARE OF DIFFERENT MAGNITUDE SCALES BUT

DON'T LOOK FOR THEIR PRECISE CONVERSION:

OFTEN EVEN THE SIMPLEST CHOICE - MAXIMAL

OF ALL VERSIONS OF M - IS ACCEPTABLE

INTENSITY IS USUALLY UNRELIABLE FOR ESTIMATION

OF M

PARAMETERS OF THE ALGORITHM

DEFINITION OF AFTERSHOCKS: T(M), H(M), R(M)

MAGNITUDE INTERVALS: M_o, a₁, a₂, a₃ (or \$)

PATTERN B: e, B, T

VALUES SHOULD BE FIXED, IF FOSSIBLE, PRIOR TO DATA PROCESSING.

M 2.5 2.5 3- 3.5- 4- 4.5- -2.99 -3.49 -3.99 -4.49 -4.99

T(M) (days) 1.45 2.85 5.7 11.41 22.81 45.63

 $a_1 = 0.1$, $a_2 = 1.0$, $a_3 = 3.5$, e = 2 days, T = 3 years

THE CHOICE OF M (MAGNITUDE THRESHOLD FOR STRONG

EARTHQUAKEC) - guidelines:

THE AVERAGE INTERVAL BETWEEN STRONG EARTHQUAKES SHOULD BE MUCH LARGER THAN $\ensuremath{\mathcal{T}}$ (ABOUT $_3$ TIMES).

THE EARTHQUAKES WITH M \approx M SHOULD BE NOT TOO NUMEROUS: M SHOULD BE CHOSEN IN A MINIMUM OF A HISTOGRAM N(M)

THE CHOICE OF \bar{B} IS NOT POSSIBLE PRIOR TO RETROSPECTIVE PROGNOSIS. GUIDBLINES:

THE NUMBER OF MAIN SHOCKS WITH $\mathfrak{b} \geqslant \tilde{B}$ SHOULD BE MORE THAN THE NUMBER OF STRONG EARTHQUAKES BUT NOT TOO LARGE.

MAIN SHOCKS WITH $b \approx \overline{B}$ SHOULD BE NOT TOO NUMEROUS: \overline{B} SHOULD BE CHOSEN IN A MINIMUM OF A HISTOGRAM N(b).

QUALITY OF RETROSPECTIVE PREDICTION

- T PERIOD OF THE RETROSPECTIVE PREDICTION
- T_a PART OF THE PERIOD T COVERED BY

 T INTERVALS AFTER EACH PATTERN B

 (OVERLAPPING PARTS ARE COUNTED ONCE).
- $\mathbf{n}_{\mathbf{a}}$ the number of strong earthquakes within these intervals.
- n TOTAL NUMBER OF STRONG EARTHQUAKES.
- COMPETING HYPOTHESIS: STRONG EARTHQUAKES ARE
 UNIFORMLY DISTRIBUTED AND INDEPENDENT OF
 PATTERNS B.

PROBABILITY:

$$P = \sum_{j=n}^{n} C_{n}^{j} \left(\frac{T_{\alpha}}{T} \right)^{n} \left(1 - \frac{T_{\alpha}}{T} \right)^{n-j}$$

SHOULD BE SMALL (< 0.1) TO REJECT THE COMPETING HYPOTHESIS.

THIS IS NOT THE CONCLUSIVE TEST, SINCE WE DATA-FITTED SOME PARAMETERS AND STRONG EARTHQUAKES ARE DEFINITELY NON-UNIFORMLY DISTRIBUTED,

- ANOTHER COMPETING HYPOTHESIS: STRONG EARTHQUAKES

 AND PATTERNS B ARE INDEPENDENT, BOTH ARE

 MORE FREQUENT DURING THE PERIODS OF LARGE

 SEISMIC ACTIVITY.
- THE CHECK: RETROSPECTIVE PREDICTION FOR INVERSE TIME, TAKING AS TIPS THE au -INTERVALS BEFORE PATTERNS 2.

STABILITY TO VARIATION OF PARAMETERS IS ADDITIONAL CON-FIRMATION OF RETROSPECTIVE PREDICTION.

USUAL VARIATIONS:

M_o ±0.3

R ± 50km

2 up to 30 days

T ± 1 year

- NEAREST MINIMUMS OF A HISTOGRAM N(b)

OTHER TESTS:

TRANSFER TO ANOTHER TERRITORY
VARIATION OF REGION BOUNDARIES

CONCLUSIVE TEST: CURRENT MONITORING OF THE PATTERN B AND FORWARD PREDICTION.

Conductor atmi carables to
