Nuclear Data Measurements

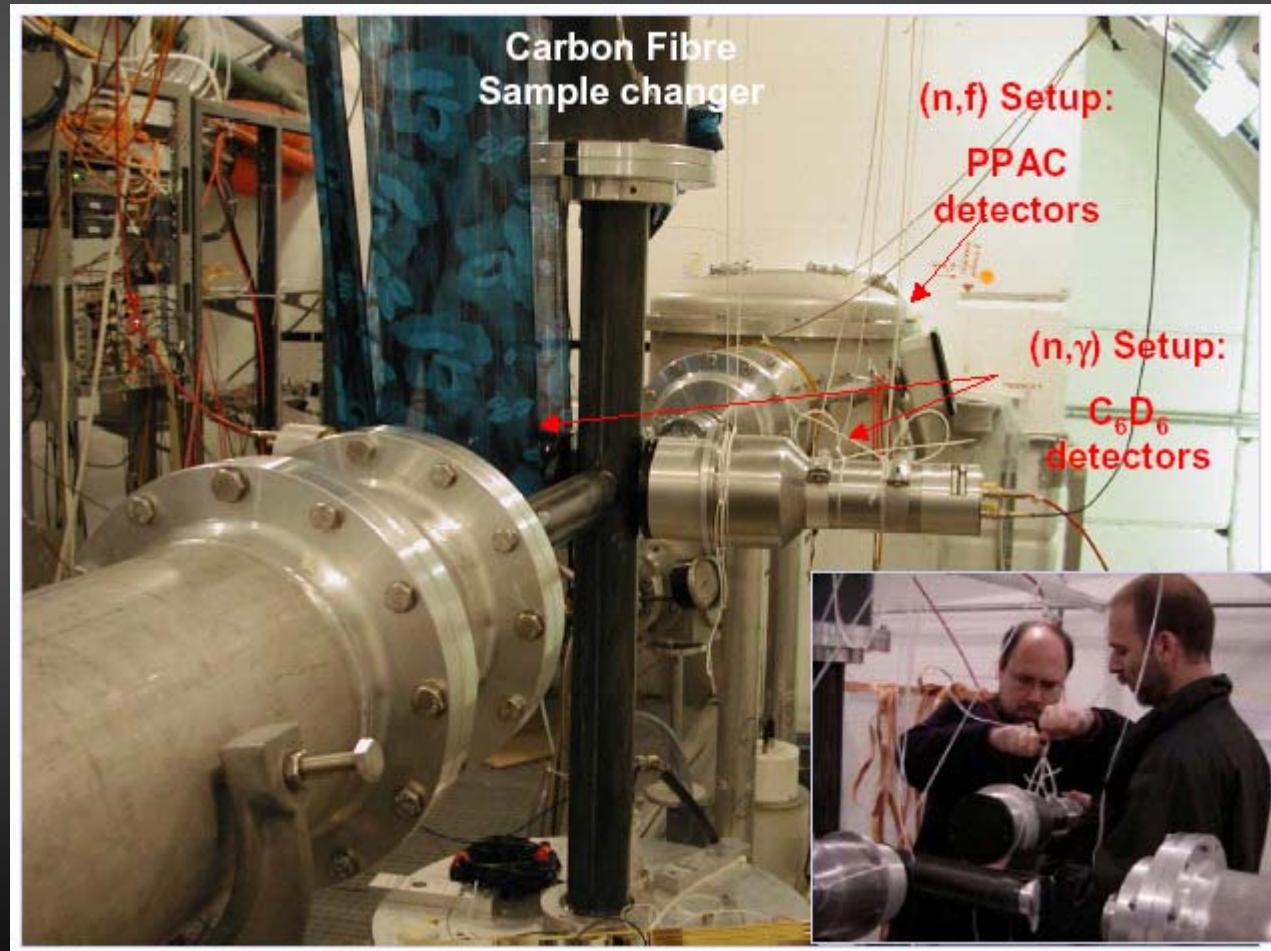

Nuclear Reaction Experiments

Nuclear Data Measurements

Nuclear Reaction Experiments

Say, here I am! A nuclear physicist.
And I need to measure neutron reaction
cross sections with the time-of-flight
technique...

World scene for tof measurements

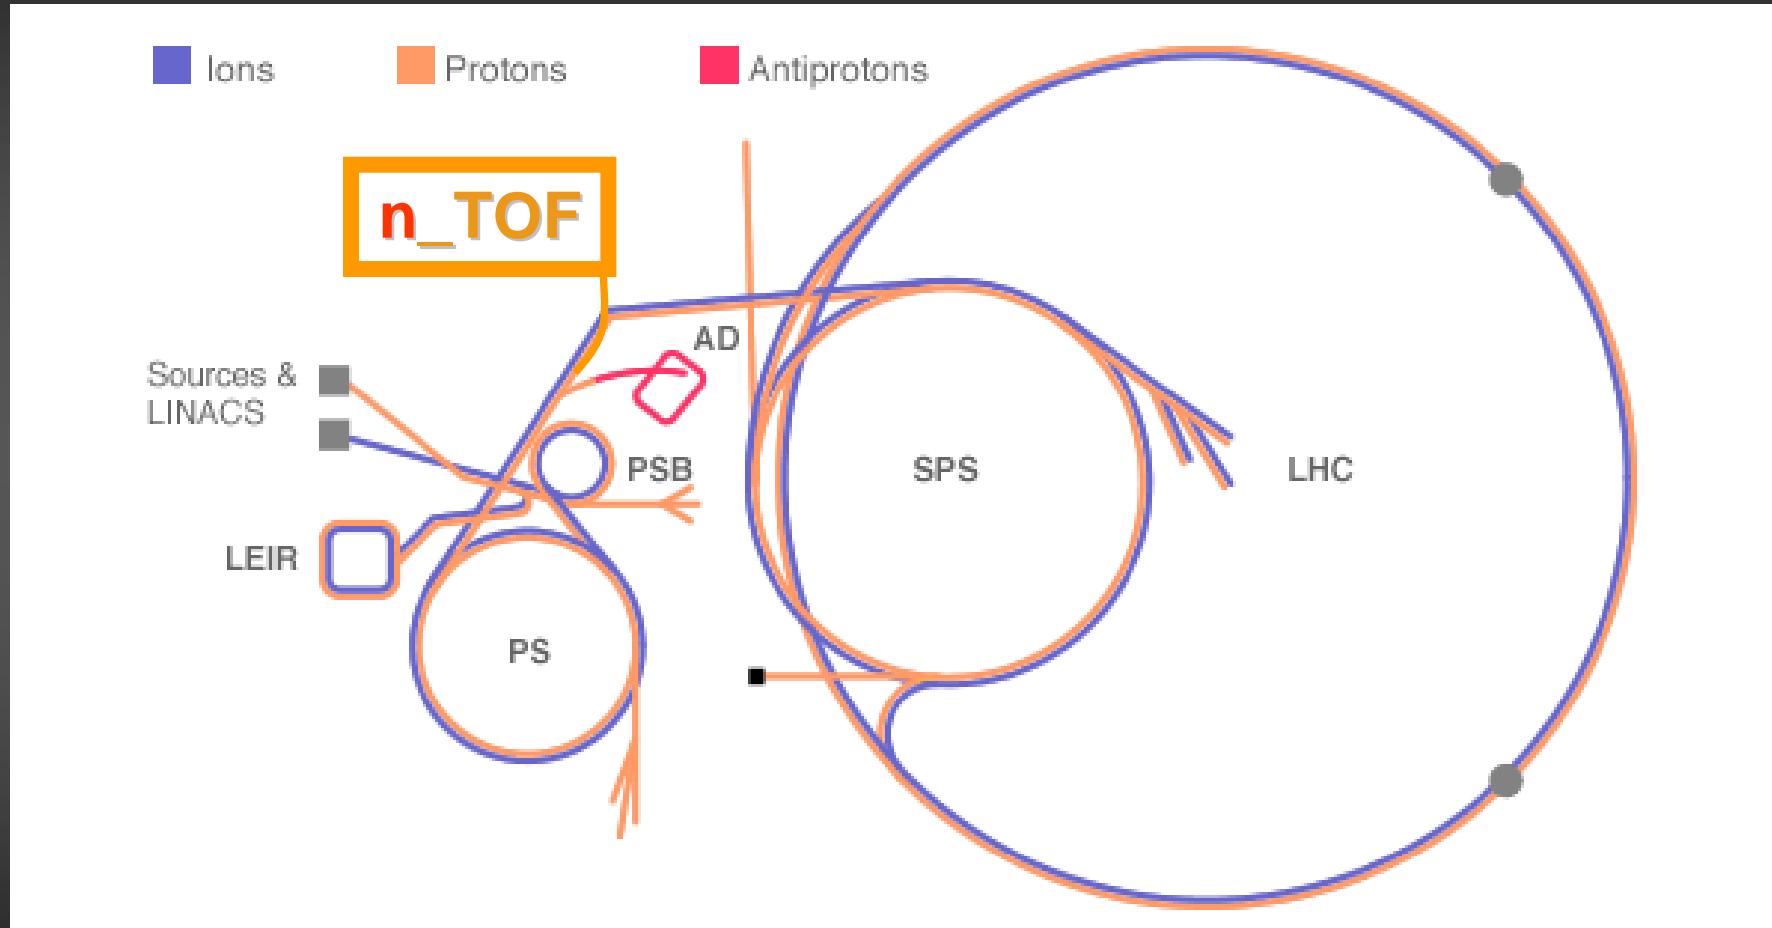

facility		driver and energy	repetition rate	n source	n energy range	flight path length
FZK TIT ...	Karlsruhe Tokyo ...	varii in the MeV range	MHz	⁷ Li(p,n) & others	few keV up to 1 MeV monoE above	10s cm
GELINA	EC-JRC Geel	electron linac 150 MeV	800 Hz	photo-n photo-f	10 meV – 20 MeV	10m to 400m
LANSCE	Los Alamos National Laboratory	proton linac 800 MeV	20 Hz	spallation	< 500 keV (DANCE)	20m
n_TOF	CERN	PS 20 GeV	0.4 Hz (average)	spallation	10 meV – 250 MeV (or wider)	200m

The n_TOF facility at CERN

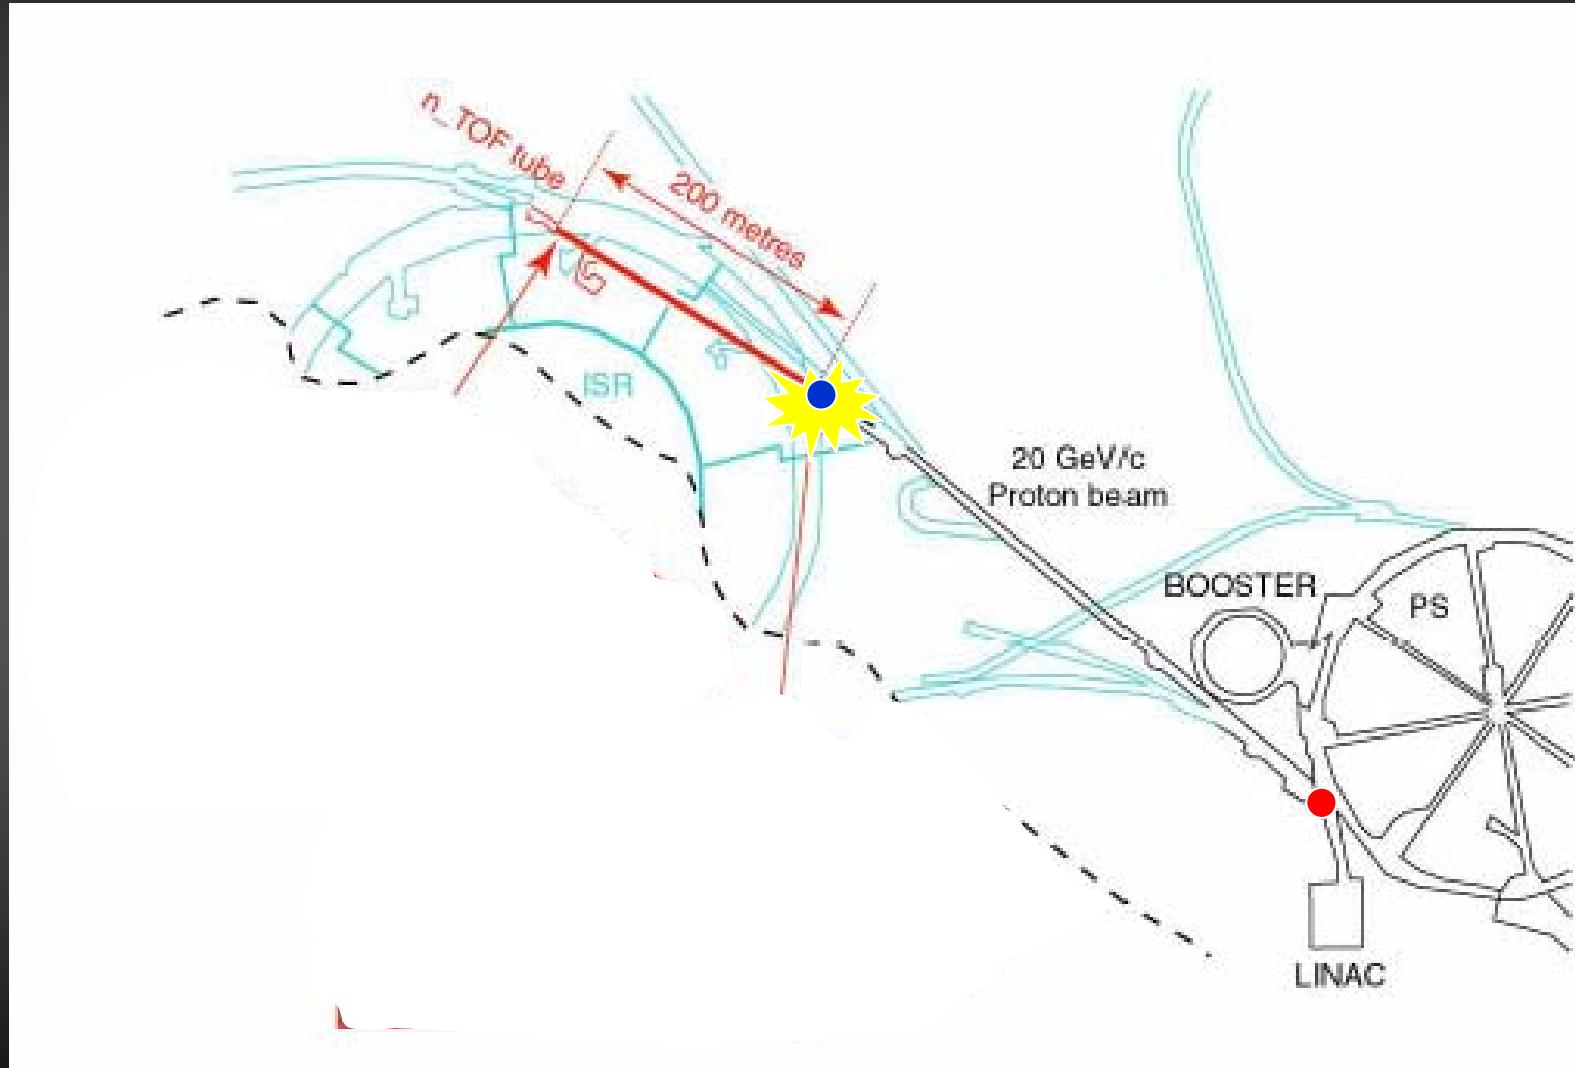

somewhere around here

CERN accelerator Complex

Linac(s): up to 50 MeV PSB: up to 1 GeV PS: up to 24 GeV

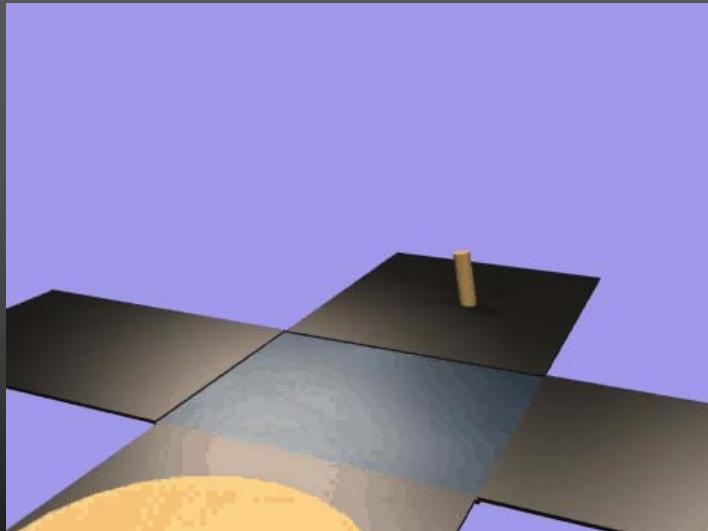

The n_TOF facility at CERN

The n_TOF facility at CERN

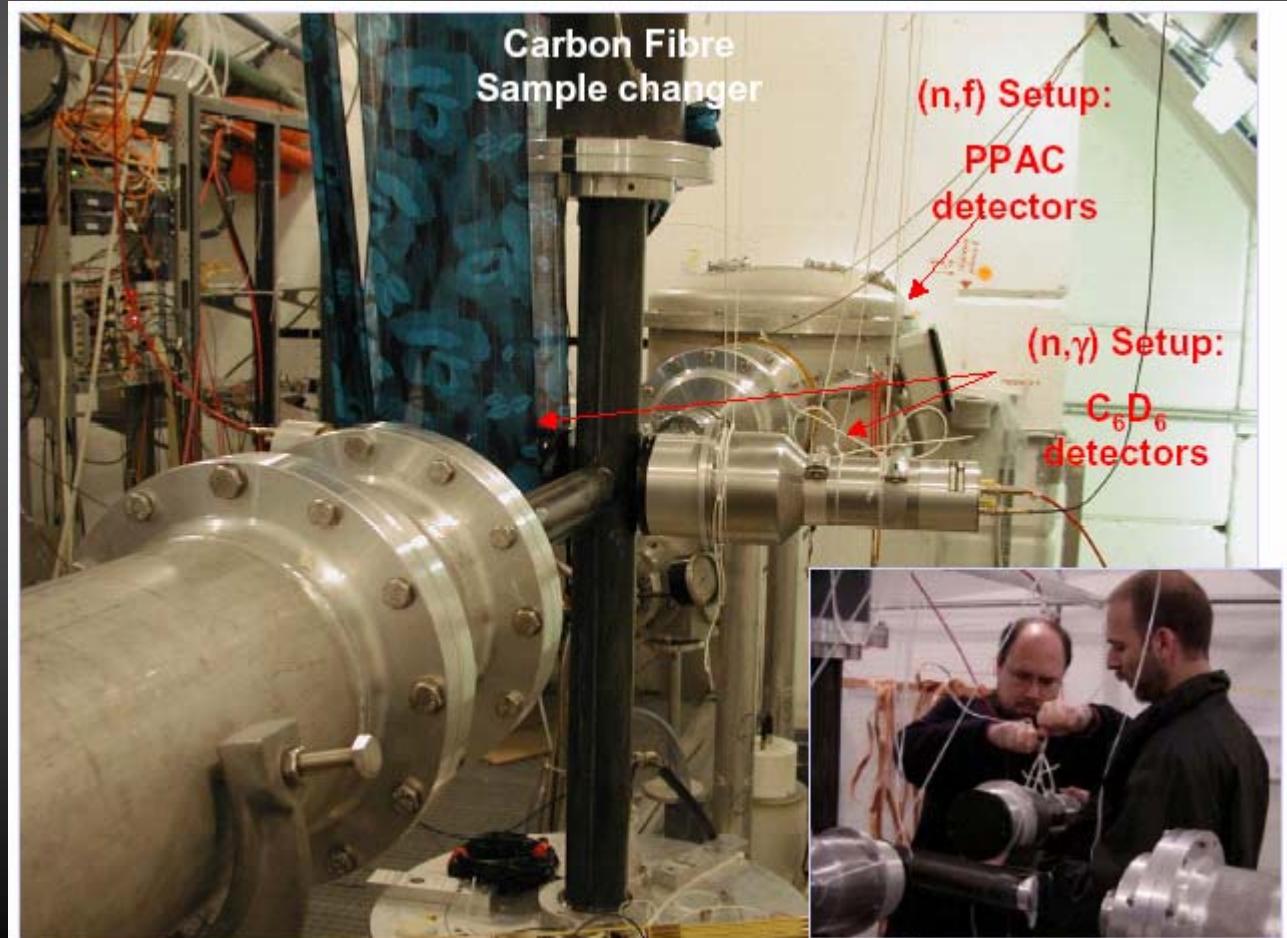

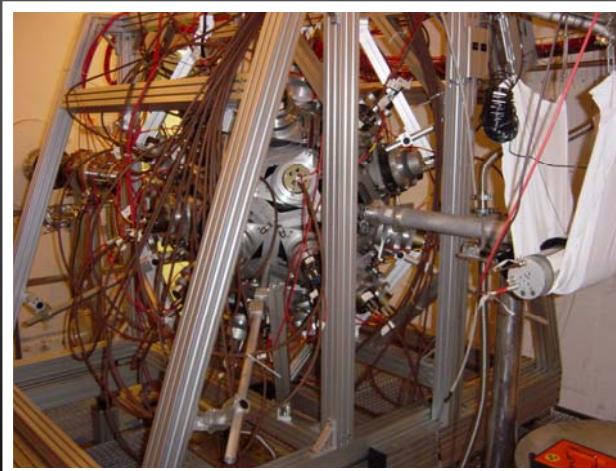

movie by V Vlachoudis (CERN)

- Design: the n_TOF tunnel

The real world

- n_TOF commissioned in 2001-2002

n_TOF basic parameters

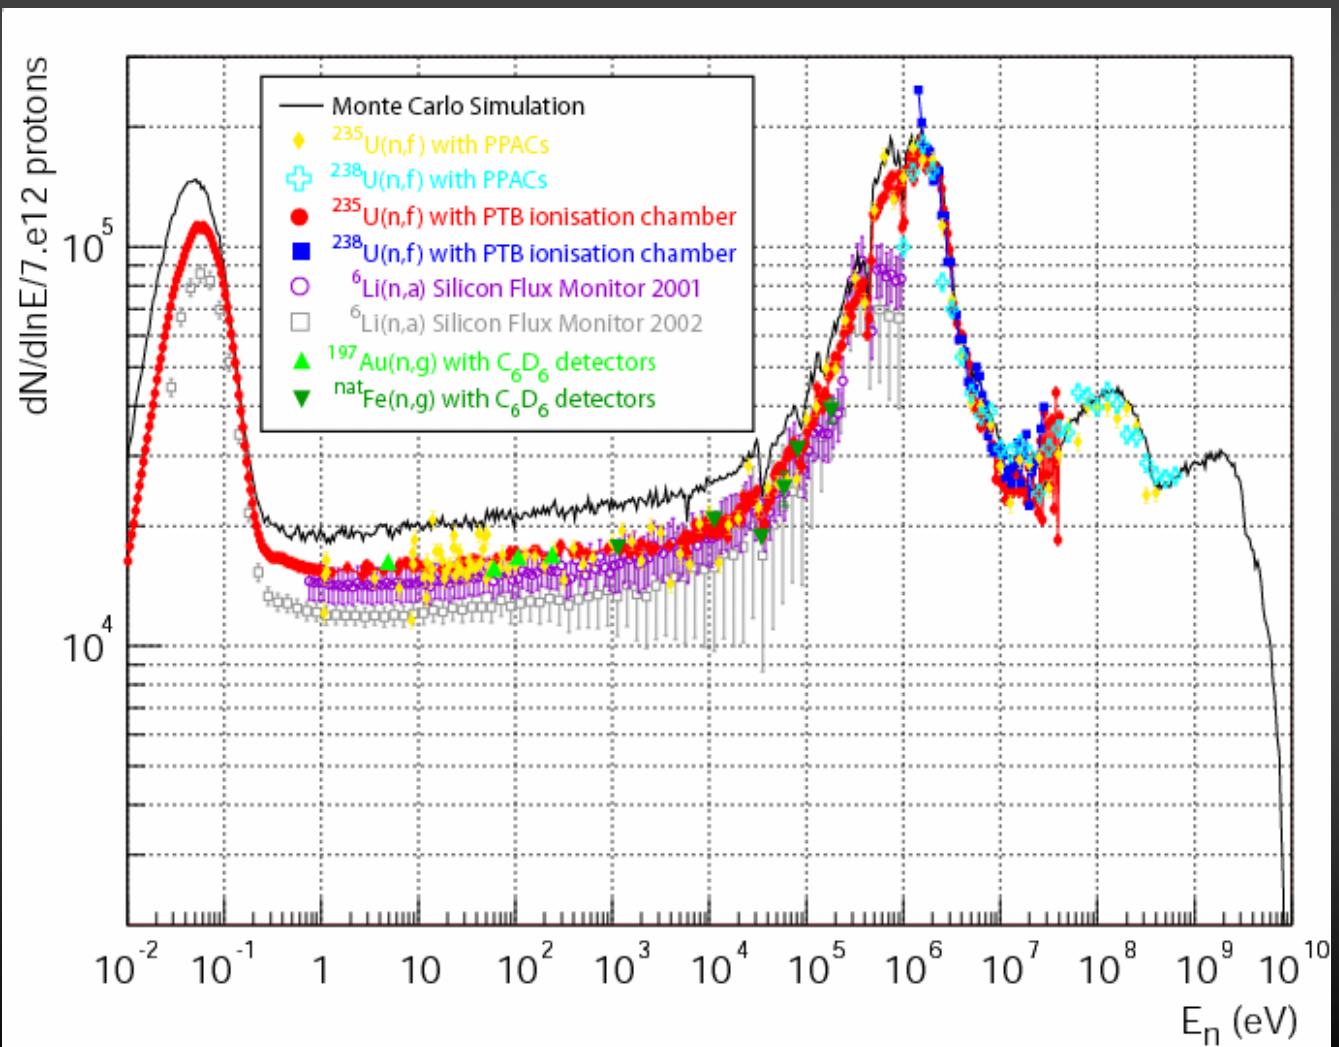

proton beam momentum	20 GeV/c
intensity (dedicated mode)	7×10^{12} protons/pulse
repetition frequency	1 pulse/2.4s
pulse width	6 ns (rms)
n/p	300
lead target dimensions	80x80x60 cm ³
cooling & moderation material	H ₂ O
moderator thickness in the exit face	5 cm
neutron beam dimension in EAR-1 (capture mode)	2 cm (FWHM)

n_TOF beam characteristics

■ the neutron flux

Performance Report
CERN-INTC-2002-037, January 2003
CERN-SL-2002-053 ECT

2nd collimator $\phi=1.8$ cm
(capture mode)

The neutron fluence in EAR-1

Energy range	Uncollimated [n/pulse/cm ²]	Capture mode [n/pulse]	Fission mode [n/pulse]
< 1 eV	2.0E+05	3.1E+05	2.0E+06
1 eV - 10 eV	2.7E+04	4.5E+04	2.9E+05
10 eV - 100 eV	2.9E+04	4.7E+04	3.1E+05
100 eV - 1000 eV	3.0E+04	5.1E+04	3.3E+05
1 eV - 1 keV	8.6E+04	1.4E+05	9.3E+05
1 keV - 10 keV	3.2E+04	5.4E+04	3.6E+05
10 keV - 100 keV	3.9E+04	7.1E+04	4.7E+05
100 keV - 1000 keV	1.1E+05	2.3E+05	1.5E+06
1 keV - 1 MeV	1.8E+05	3.5E+05	2.3E+06
1 MeV - 10 MeV	8.3E+04	2.4E+05	1.7E+06
10 MeV - 100 MeV	2.8E+04	7.2E+04	5.1E+05
> 100 MeV	4.4E+04	1.2E+05	5.6E+05
1 MeV - > 100 MeV	1.6E+05	4.4E+05	2.7E+06
Total	6.2E+05	1.2E+06	8.0E+06

Note: 1 pulse is 7E+12 protons. Collimated fluence (fission and capture modes) is integrated over the beam surface.

n_TOF beam characteristics

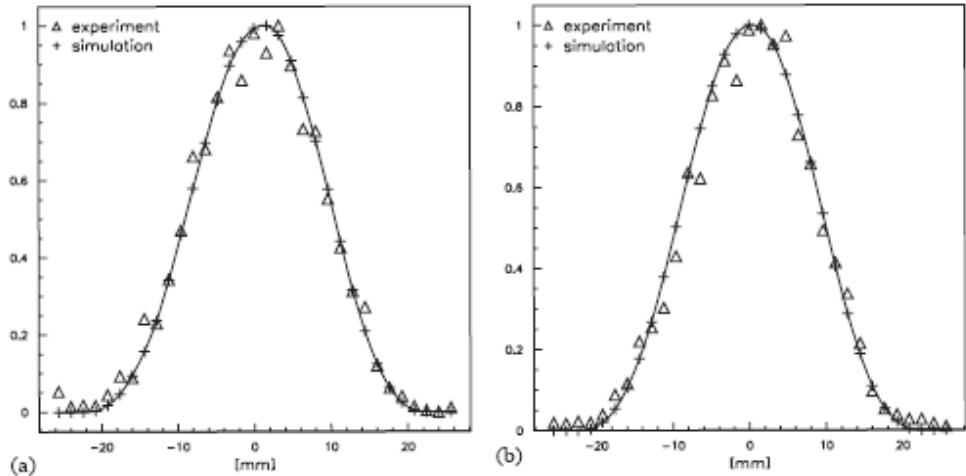

- Beam profile @ 187.5 m

MicroMegas detector

n_TOF beam

■ energy resolution

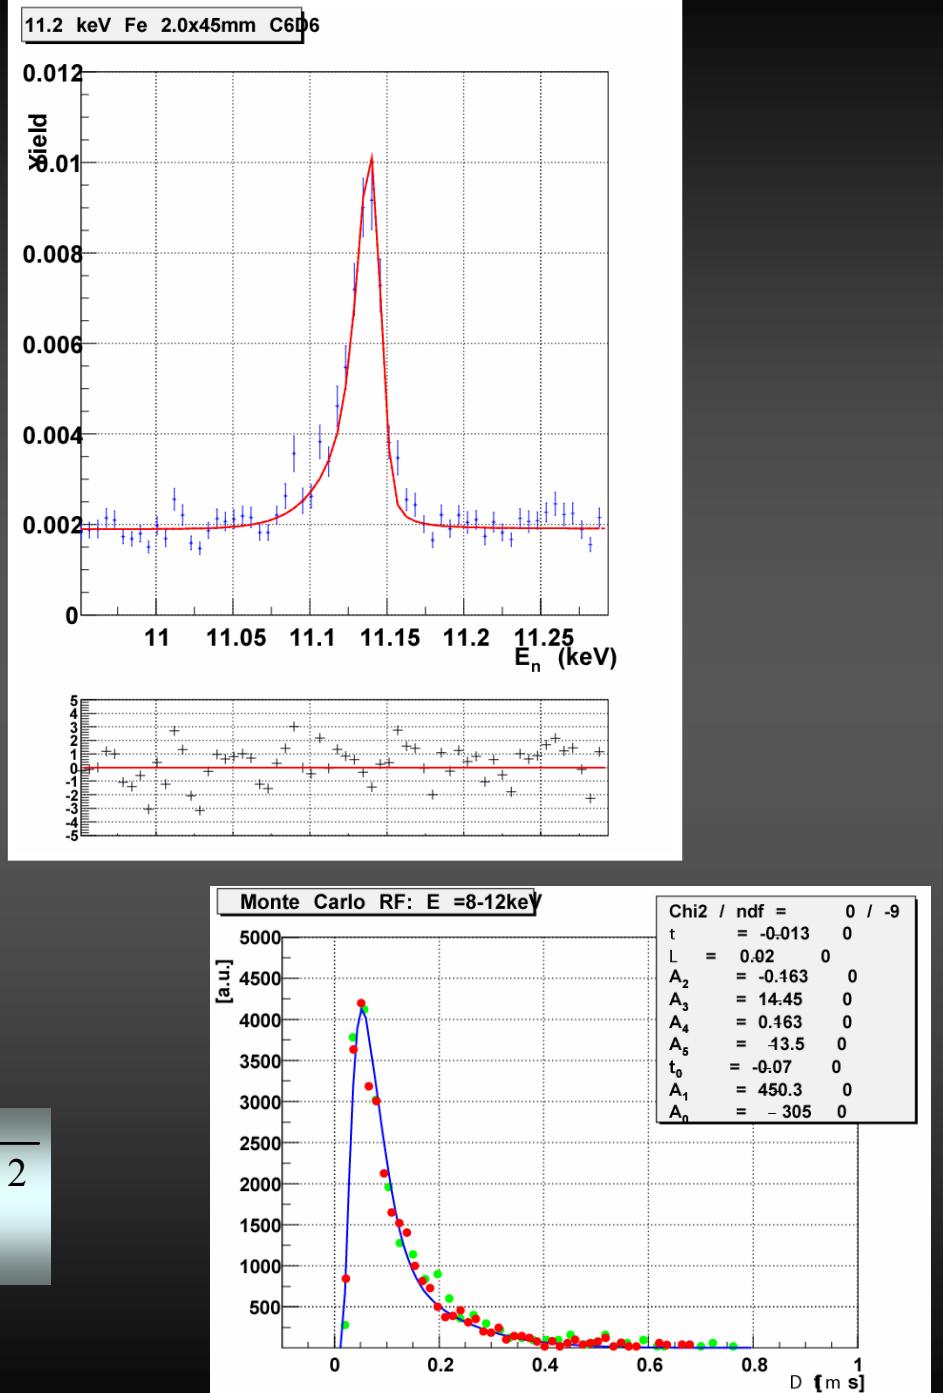

Performance Report
 CERN-INTC-2002-037, January 2003
 CERN-SL-2002-053 ECT

Energy resolution @ 187.5 m (collimator for capture mode)

Neutron Energy	p-beam pulse width FWHM [cm]	moderation FWHM [cm]	$\Delta E/E$
1 eV	0.0	3.0	3.0E-04
10 eV	0.1	3.0	3.2E-04
100 eV	0.2	3.3	3.5E-04
1 keV	0.6	5.1	5.5E-04
10 keV	2.0	7.9	8.7E-04
30 keV	3.4	10.2	1.1E-03
100 keV	6.2	18.0	2.0E-03
1 MeV	19.5	34.1	4.2E-03
10 MeV	61.7	16.9	6.8E-03
100 MeV	195.0	14.5	2.1E-02

$$\frac{\Delta E}{E} = \frac{2}{L} \sqrt{\Delta L^2 + 1.91 \cdot E \cdot \Delta T^2}$$

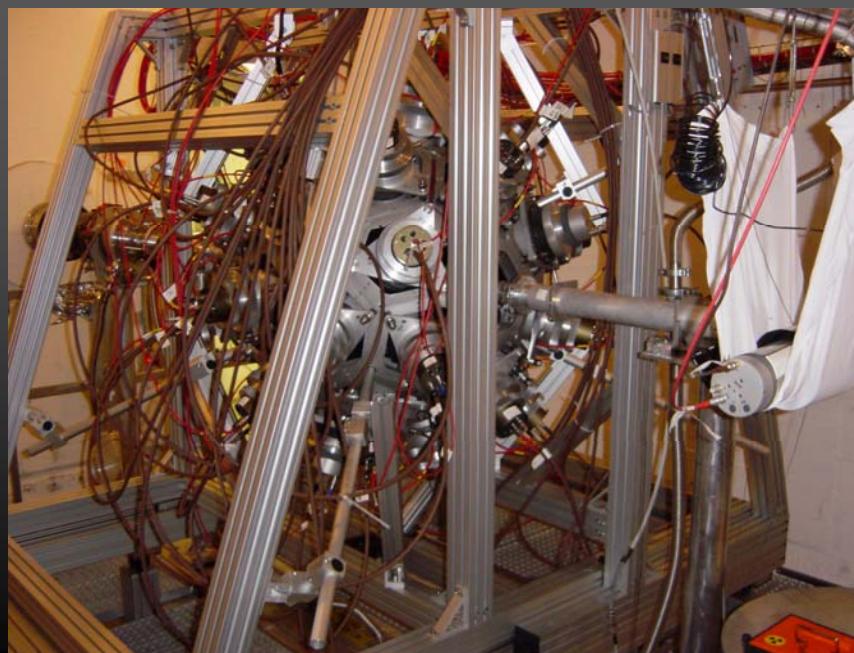

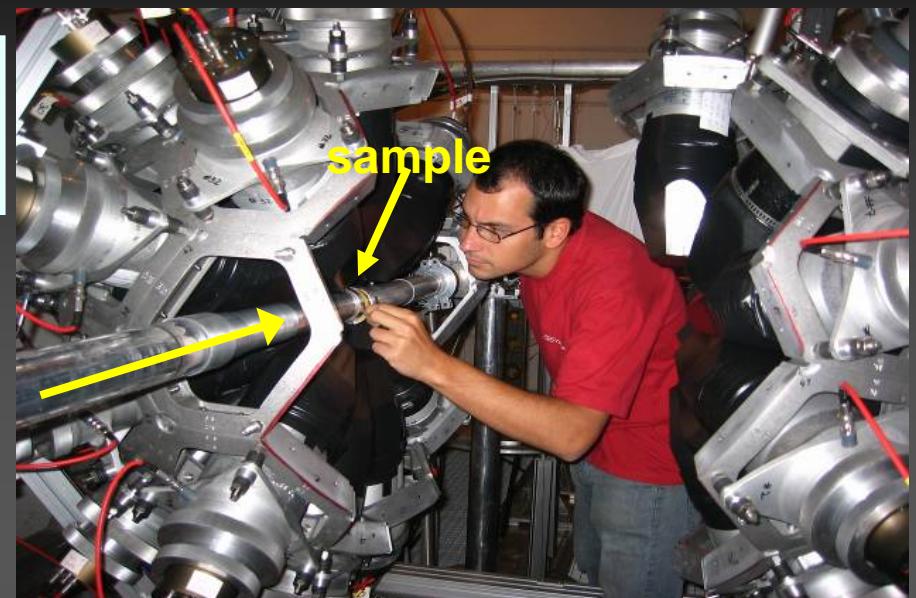

(for example: 6×10^{-4} @ 1 keV)

$n_{_}$ TOF TAC for (n,γ) measurements

- Structure mounted in April-04
- 4π geometry: end of May-04
- 1.5 month commissioning
- Au(n,γ) & other standards

First measurement with a radioactive sample started in August 2004
 $^{237}\text{Np}(n,\gamma)$

Why we do all this?

Objectives

- Measurements of neutron cross sections relevant for Nuclear Waste Transmutation and related Nuclear Technologies
- Cross sections relevant for Nuclear Astrophysics
- Neutrons as probes for fundamental Nuclear Physics

Objectives

- Measurements of neutron cross sections relevant for Nuclear Waste Transmutation and related Nuclear Technologies
- Cross sections relevant for Nuclear Astrophysics
- Neutrons as probes for fundamental Nuclear Physics

Nucleosynthesis: the s-process

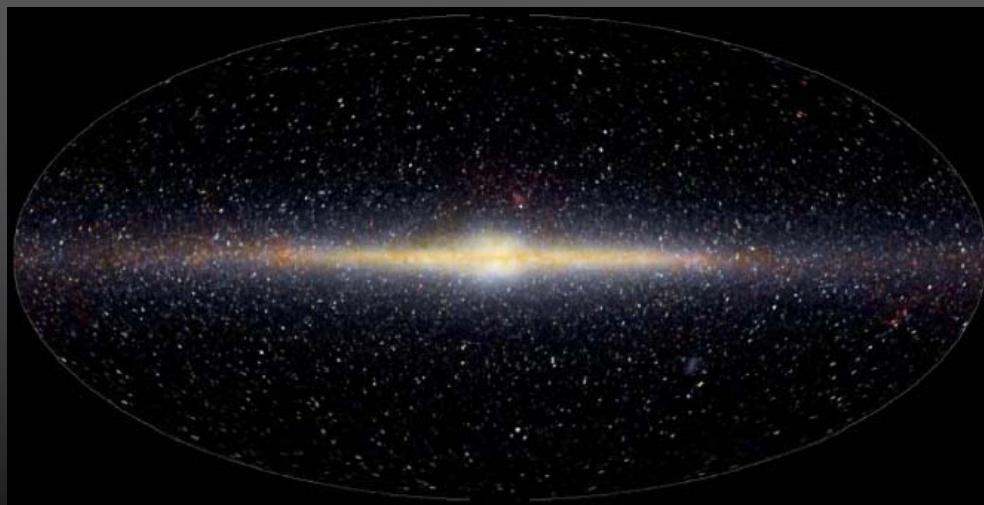

- ½ of the elements above Fe are produced by the s-process
- The astrophysical sites of the s-process are:
 - He burning in intermediate/massive stars
 - Low-mass AGB's
- There exists a direct correlation between the neutron capture cross section and the abundance ($\sigma(n, \gamma) \cdot N = const.$)
- The neutron capture cross sections are key ingredients for s-process nucleosynthesis

The canonical s-process

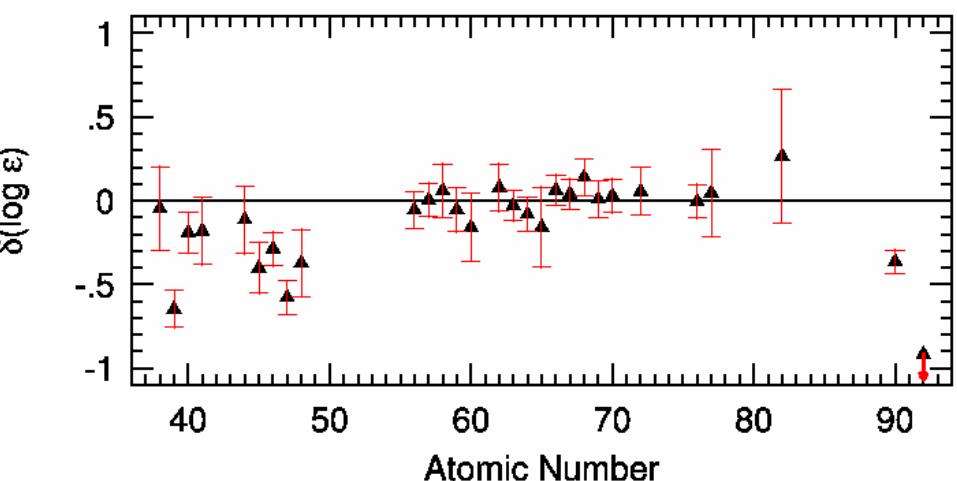

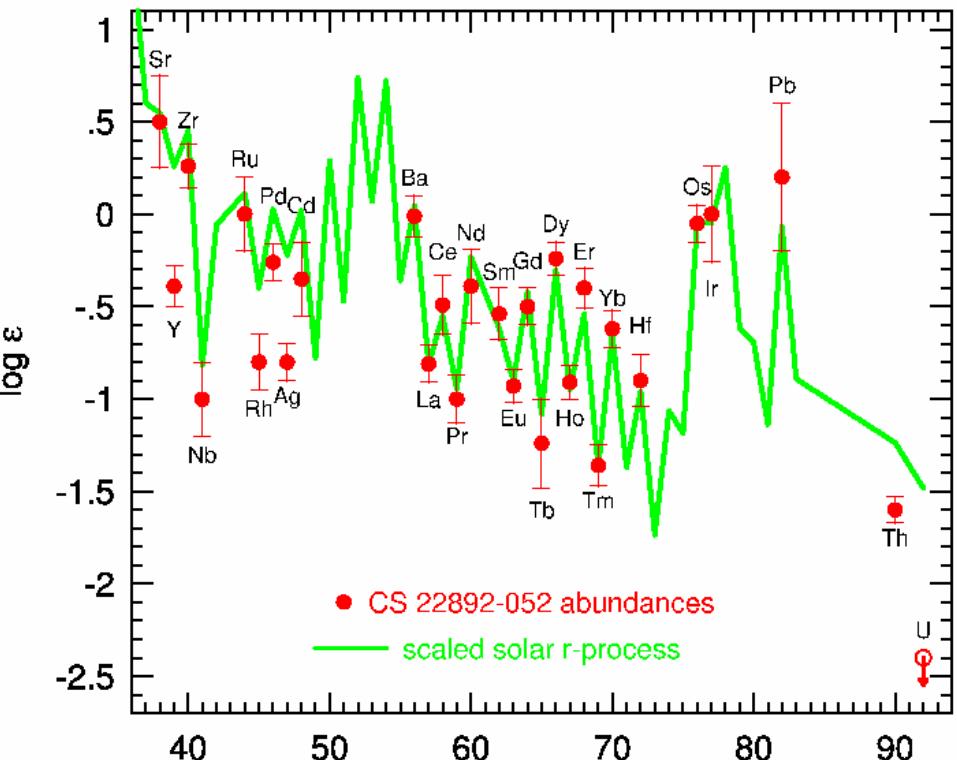

Nucleosynthesis: the s-process & the r-process residuals

$$N_r = N_{\text{solar}} - N_s$$

40 Research Institutions
120 researchers

The second n_TOF beam line & EAR-2

Flight-path length : ~20 m
at 90° respect to p-beam direction
expected neutron flux enhancement: ~ 100
drastic reduction of the t_0 flash

From measurements to data libraries

So, you see. That is how we usually do nuclear data experimental work.

Thank you. Now that we know how measurements are done, how can we produce evaluated data libraries?

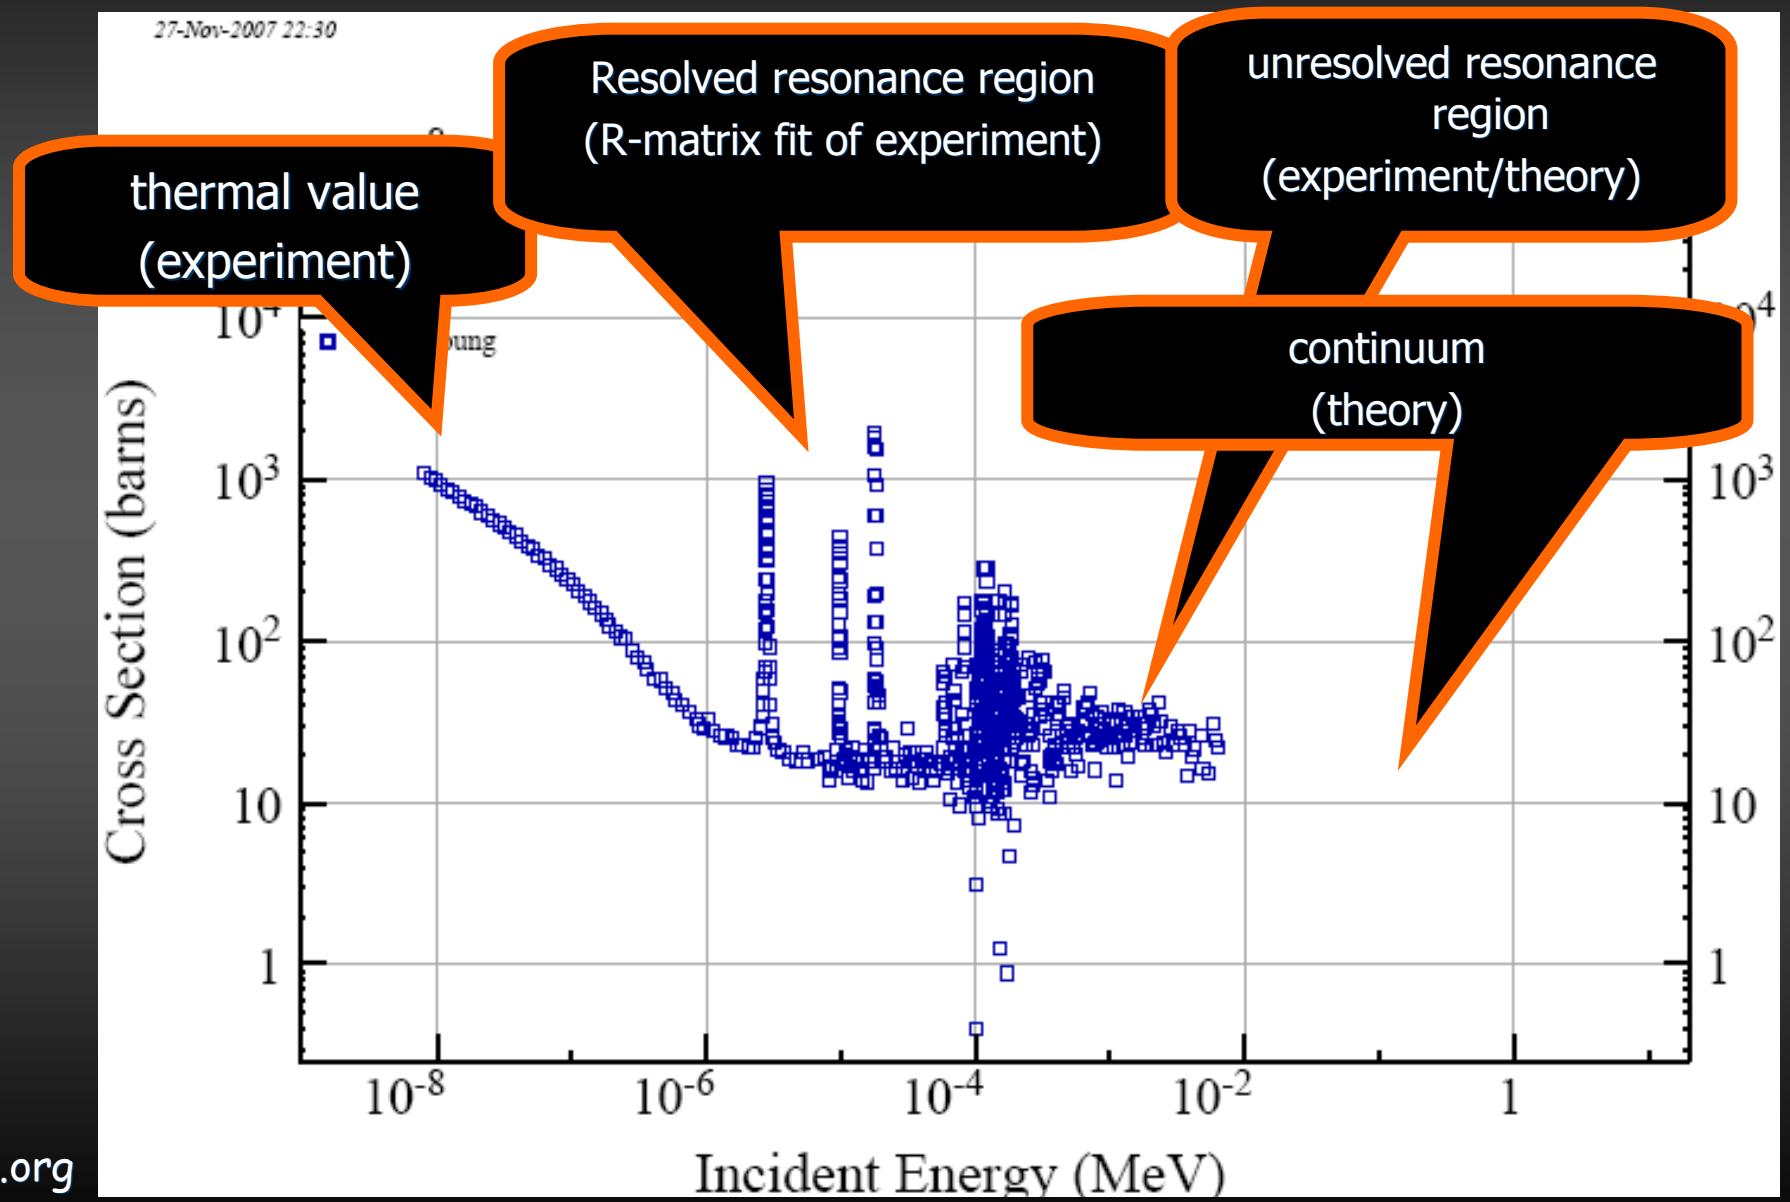

Evaluated Data Libraries

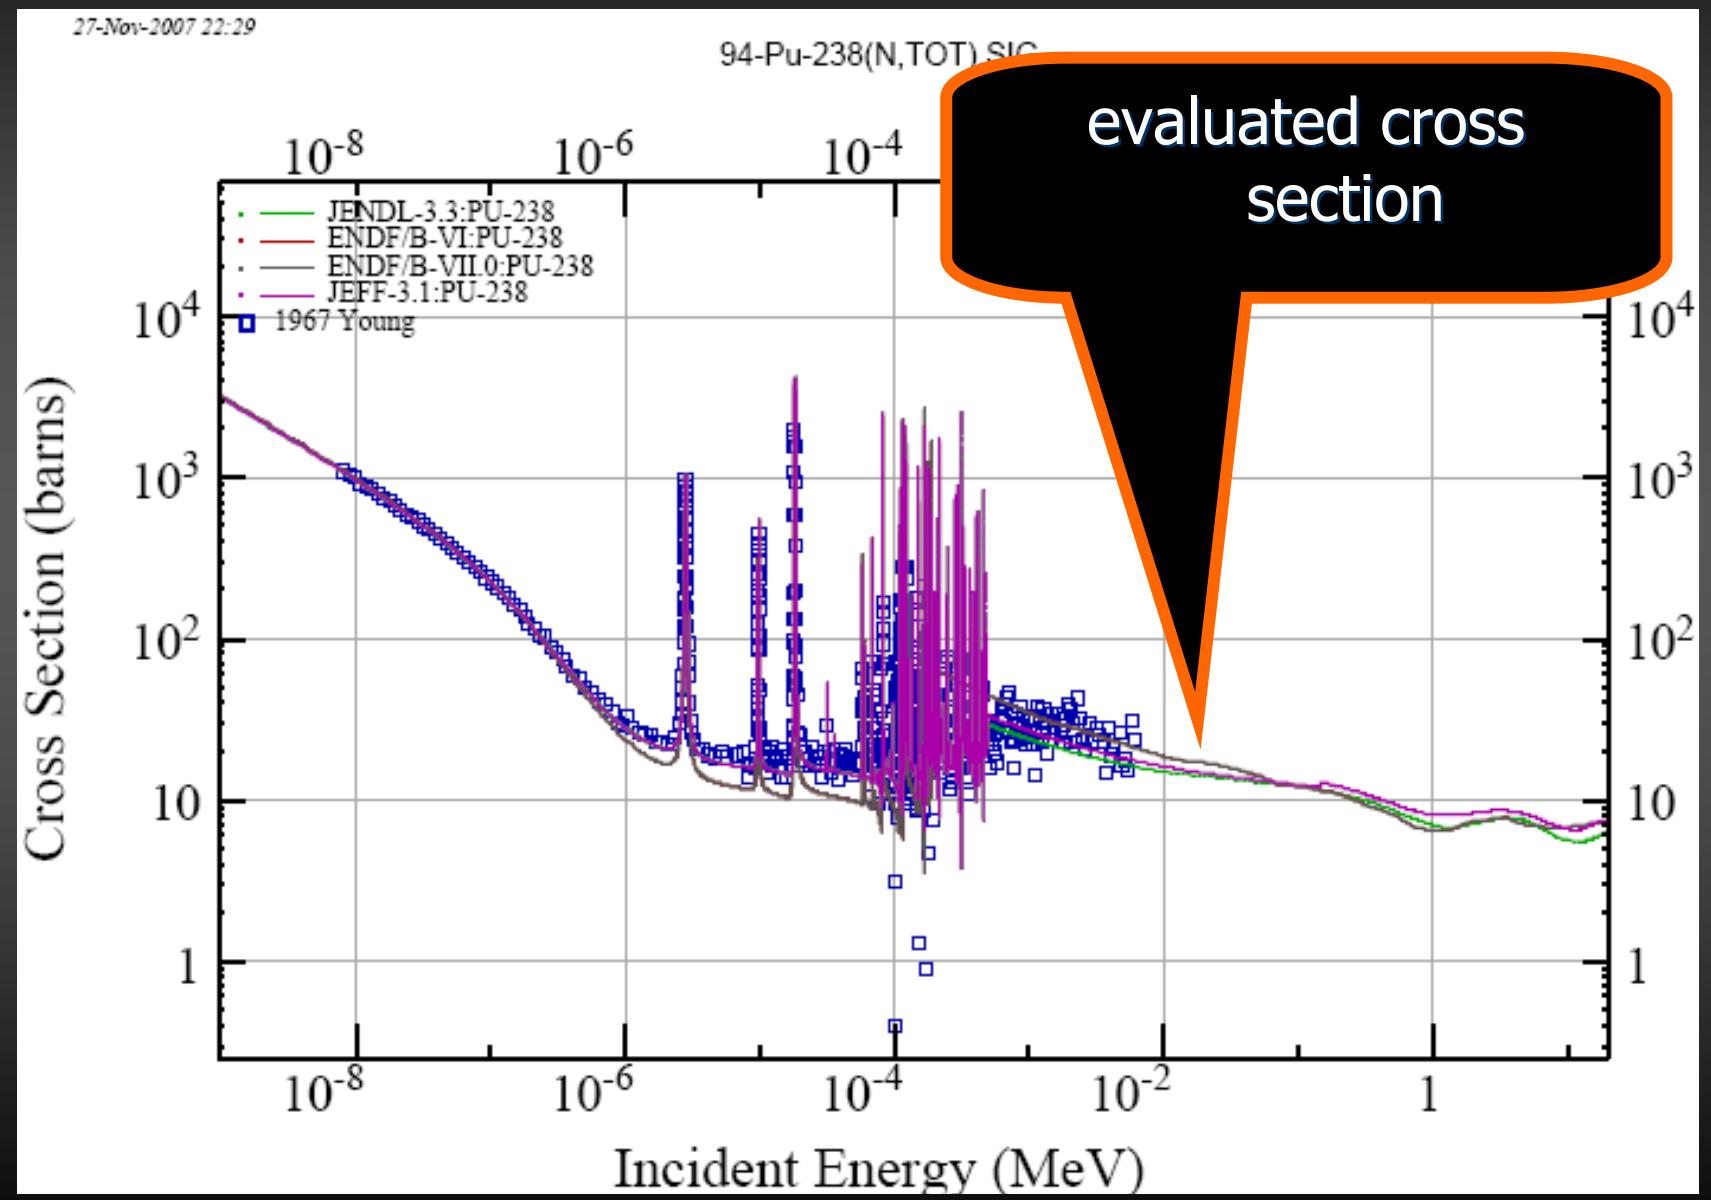

Evaluated data sets are produced through the process of critical comparison, selection renormalization and averaging of the available experimental data, normally complemented by nuclear model calculations.

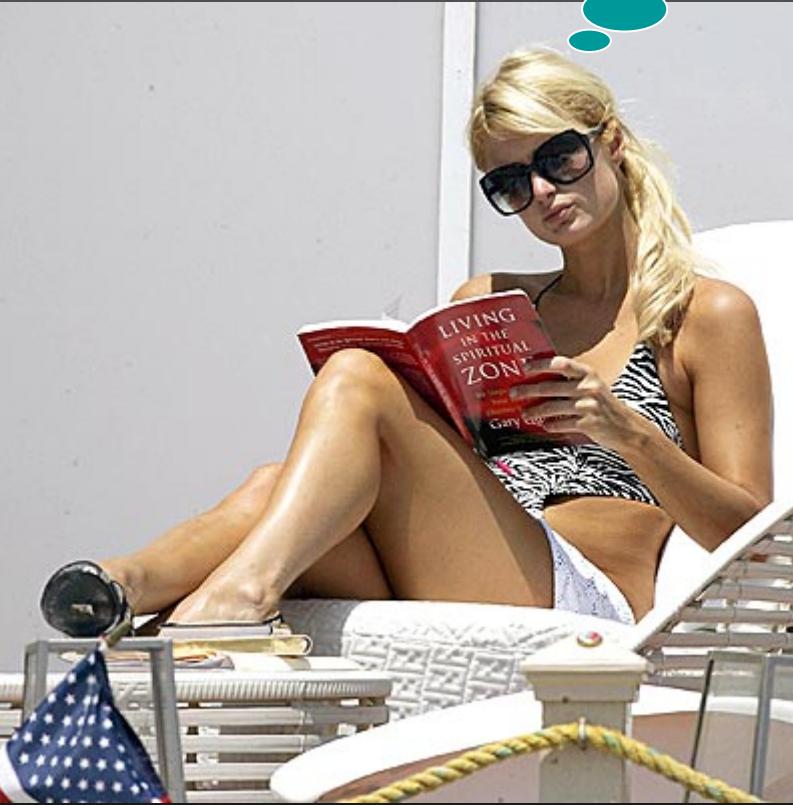

Evaluated Libraries are computer files of evaluated data which, appropriately processed, form the input data to computations for a wide variety of nuclear science and technology applications. Each of these evaluated libraries may consist of individual evaluated data sets for several hundred isotopes or elements (commonly referred to as 'materials').

From experimental data...

... to evaluated Data Libraries

Uhmm... Interesting!

I wonder if I have to get
nuclear data from printed
stuff, or I ca get them
online...

Providing On-line Services: Retrieval and Display Tools

Example:

what is the capture cross section
of Zr-91 at $E_n = 30 \text{ keV}$?

Welcome to the IAEA Nuclear Data Centre
Nuclear Data Services

Search NDS Go

Major Databases

CINDA - neutron reaction data bibliography
ENDF - evaluated nuclear reaction cross section libraries
ENDF - experimental nuclear reaction data
ENSDF - evaluated nuclear structure and decay data (includes XUNDL)
NSR - Nuclear Science References
NuDat 2.2 - selected evaluated nuclear data

Nuclear Databases and Files

General
Atomic Mass Data Center - 2003 atomic mass evaluation, NUBASE, PC-NUCLEUS, etc.
Q-values, Thresholds - atomic masses, Q-values and threshold energies
RIPL - reference parameters for nuclear model calculations
Thermal neutron capture gamma rays - by target and by energy
Wallet cards - ground and metastable state properties

Other evaluated data libraries in ENDF format

IAEA Photonuclear Data Library - cross sections and spectra up to 140MeV
INDL/TSL - IAEA Evaluated Nuclear Data Library / Thermal Scattering Law
IRDF-2002 - International Reactor Dosimetry File
Minsk Actinides Library - evaluated neutron reaction data (Maslov et al.)
NGATLAS - atlas of neutron capture cross sections ([old-version](#) is here)
POINT2007 - Pointwise data of ENDF/B-VII.0 processed into temperature dependent form
POINT2004 - Pointwise data of ENDF/B-VI Release 8 at 8 temperatures
RNAL - Reference Neutron Activation Library
Standards - Neutron Cross-section Standards 2006
Th-U - Evaluated nuclear data for the Thorium-Uranium fuel cycle

Evaluated libraries in different formats

ADS-Lib Application test library in ACE and MATXS format for ADS neutronics design
Charged-particle cross section database for medical radioisotope production
FENDL-2.1 - Fusion Evaluated Nuclear Data Library, Version 2.1
IAEA-NDL-Q - index to IAEA NDS documentation series
IBANDL - Ion Beam Analysis Nuclear Data Library
MIRD - medical internal radiation dose tables
Nuclear Data for Safeguards - recommendations, 2007
PGAA-IAEA - database of prompt gamma rays from slow neutron capture
Photon and Electron Interaction Data - EPDL, EADL, EEDL, EXDL and ASF
SigmaCalc - Evaluated (recommended) differential cross sections for Ion Beam Analysis
Stopping Power Data for Light Ions - Graphs, data, programs, compiled by H. Paul
X and Gamma-rays standards - Decay data standards for detector calibration
WIMSD-IAEA Library - multigroup data library for the WIMSD code
Various Specialized Evaluated Data Libraries in ENDF and other formats

Electronic Documents

Citation Guidelines - online data service manual and citation guidelines
ENDF Format Manual - ENDF-102 June 2005 version

NDS Mirror Sites

Evaluated Nuclear Data File (ENDF)

Database Version of September 25, 2007

News

2007/04 New library: IBA-Eval
Differential charged-particle cross sections for ion beam analysis; [SigmaCalc] [IBANDL]
2007/03 Interactive Web plotting: zoom by mouse, actions by one click, more functions...
2007/02 New library:
1) IAEA-Standards, issued in 2006 [CRP-page]
2007/01 New library: ENDF/B-VII.0
ENDF/B-VII.0 US Evaluated Nuclear Data Library, released 2006/12 by NNDC [page]
[History]

Core nuclear reaction database contain recommended, evaluated cross sections, spectra, angular distributions, fission product yields, photo-atomic and thermal scattering law data, with emphasis on neutron induced reactions. The data were analyzed by experienced nuclear physicists to produce recommended libraries for one of the national nuclear data projects (USA, Europe, Japan, Russia and China). All data are stored in the internationally-adopted ENDF-6 format maintained by CSEWG.

n_TOF TAC in operation

The n_TOF Collaboration

n_TOF experiments: fission measurements

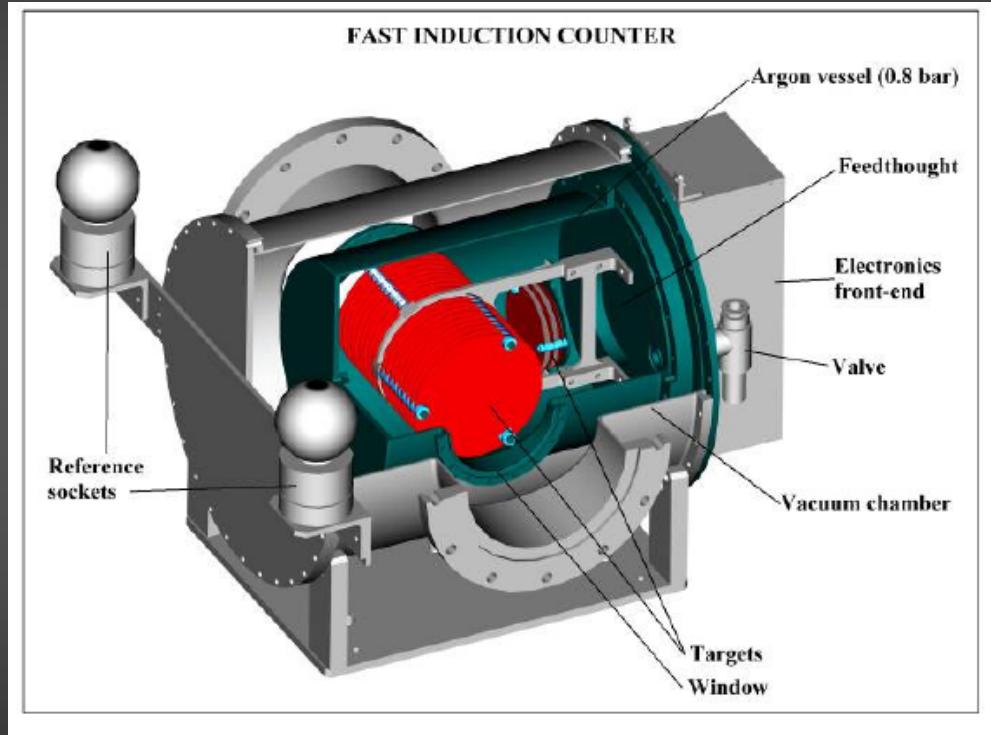

n_TOF experiments: fission measurements

- 20x20 cm²
- Isobutane gas 7 mbar
- HV 500-600 V
- 3 mm between electrodes
- 1 anode (a few ns signal width)
- Electrode thickness: 1.5 µm (Mylar+Al)
- Deposit thickness : 100-300 µg/cm²
- Backing thickness : 0.1 µm (Al)
- : 1.5 µm (Mylar)
- Fission event identification: T2 in coincidence with T1

developed at IPN Orsay

n_TOF experiments: fission measurements

- Gas: Ar (90%) CF₄ (10%)
- Gas pressure : 720 mbar
- Electric field : 600 V/cm
- Gap pitch : 5 mm
- Electrode diameter : 12 cm
- Electrode thickness: 15 µm (Al)
- Deposit thickness : 125 µm/cm²
- Backing thickness : 100 µm (Al)
- Window thickness : 125 µm

developed by a CERN/Obninsk/Dubna team

S-process site-S & conditions: weak

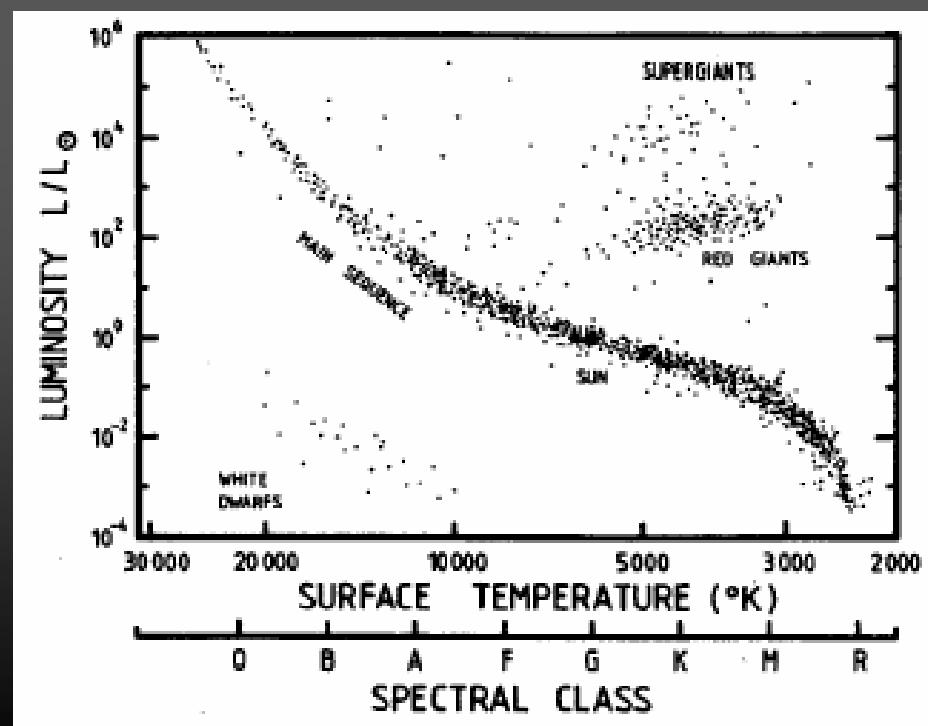

Site	He-burning phase of intermediate/massive stars
Neutron sources	$^{22}\text{Ne}(\alpha, n)^{25}\text{Mg}$
Temperature	$\sim 3 \times 10^8 \text{ K}$ or $kT \sim 25 \text{ keV}$
Neutron density	$7 \times 10^5 \text{ n/cm}^3$ (peak 2×10^7)

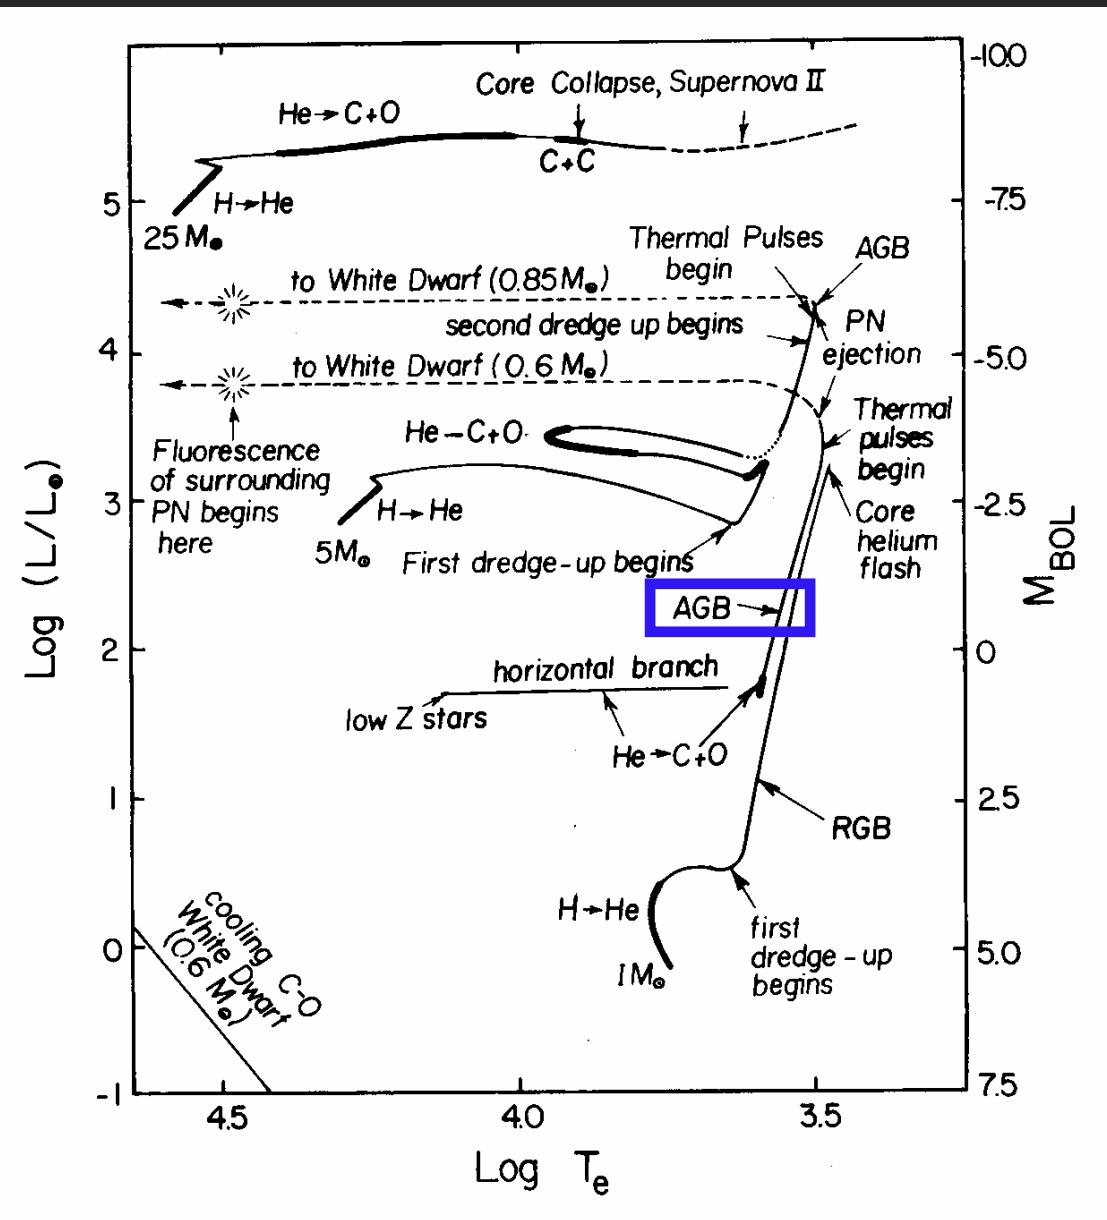

at the end of the He burning $T \approx 3 \times 10^8$: $^{22}\text{Ne}(\alpha, n)$ provides a neutron source
preexisting Fe and other “metals” serve as seed for the s-process synthesis

S-process site-s & conditions: main

Site	Thermal pulses of AGB stars (He-burning shell)	
Neutron sources	$^{13}\text{C}(\alpha, \text{n})^{16}\text{O}$	$^{22}\text{Ne}(\alpha, \text{n})^{25}\text{Mg}$
Temperature	10^8K	$kT \sim 8\text{ keV}$
Neutron density	$7 \times 10^7\text{ n/cm}^3$	10^{10} n/cm^3

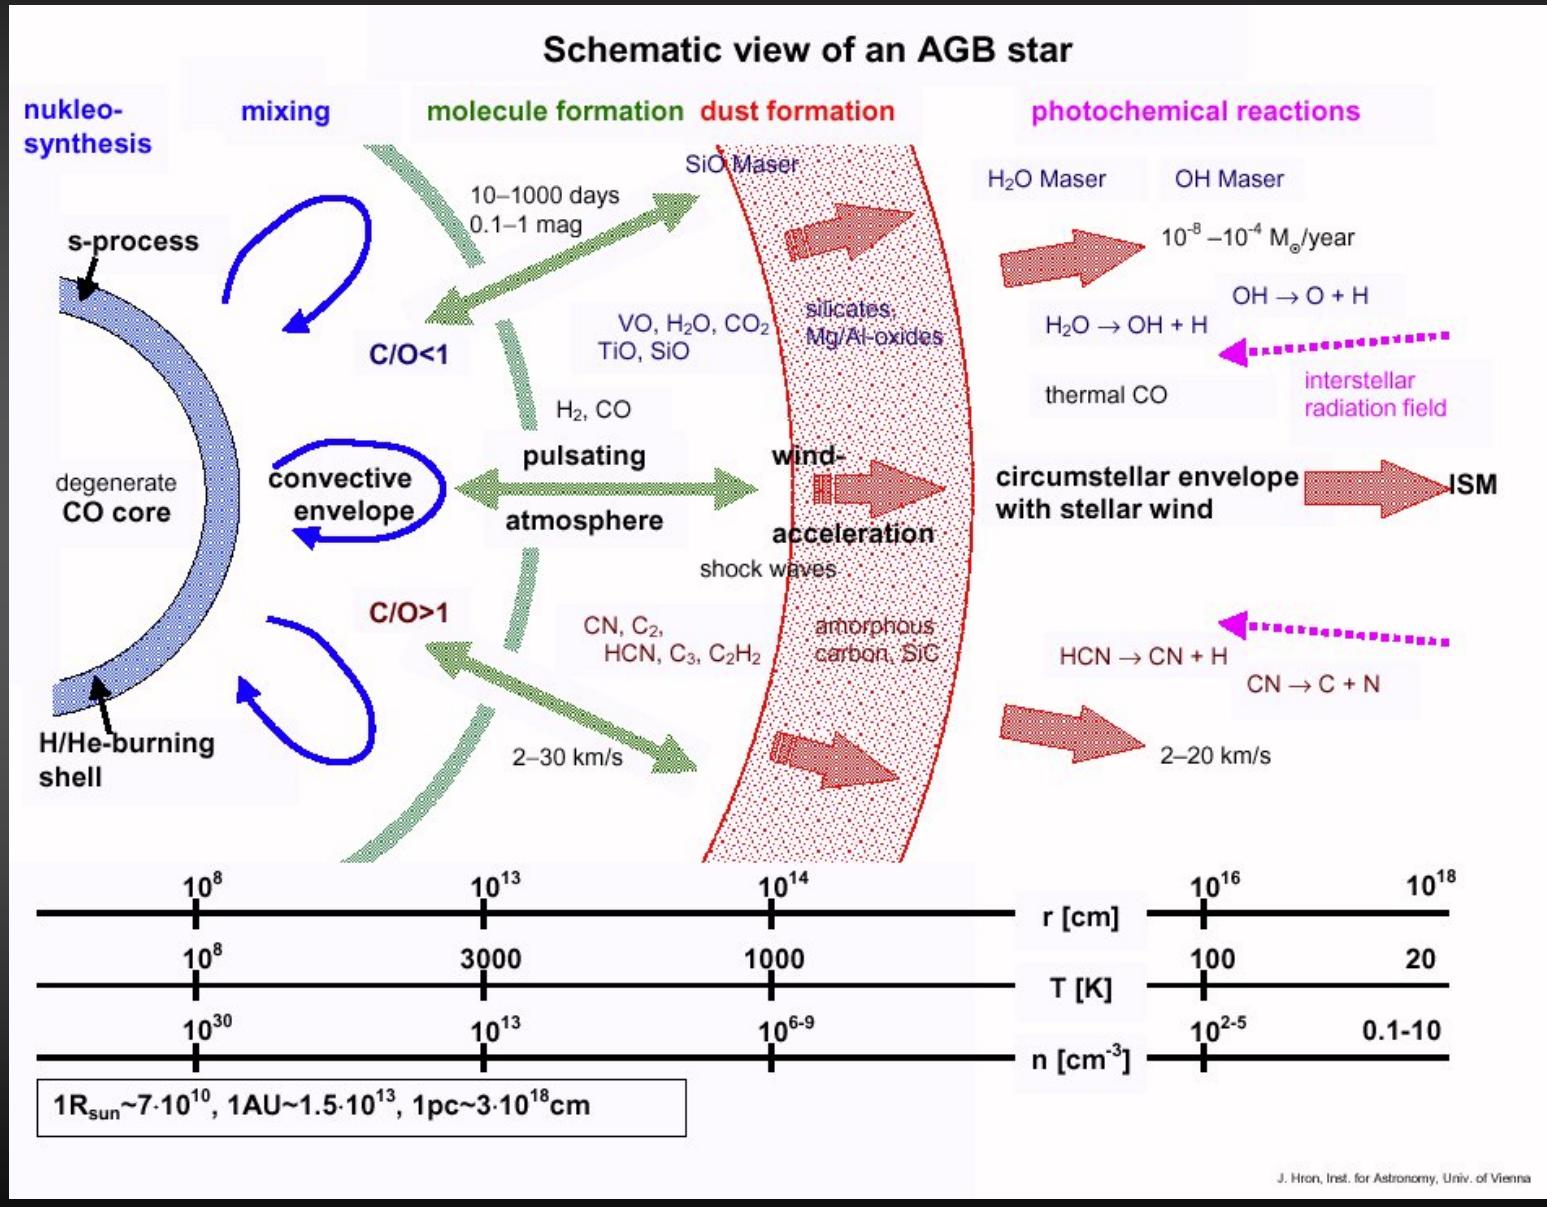

S-process site-s & conditions: main

Thermal pulses
of AGB stars (He-burning shell)

The canonical s-process

The time dependence of the abundances, N_A , is given by:

$$\frac{dN_A}{dt} = N_n(t)N_{A-1}(t)\langle\sigma_{n,\gamma}v\rangle_{A-1} - N_n(t)N_A(t)\langle\sigma_{n,\gamma}v\rangle_A - \lambda_\beta N_A(t)$$

We can define a time-integrated neutron flux (neutron exposure)

$$\tau = \int_0^t \phi_n(t') dt' = v_T \int_0^t N_n(t) dt$$

Assuming: i) $T \approx const.$

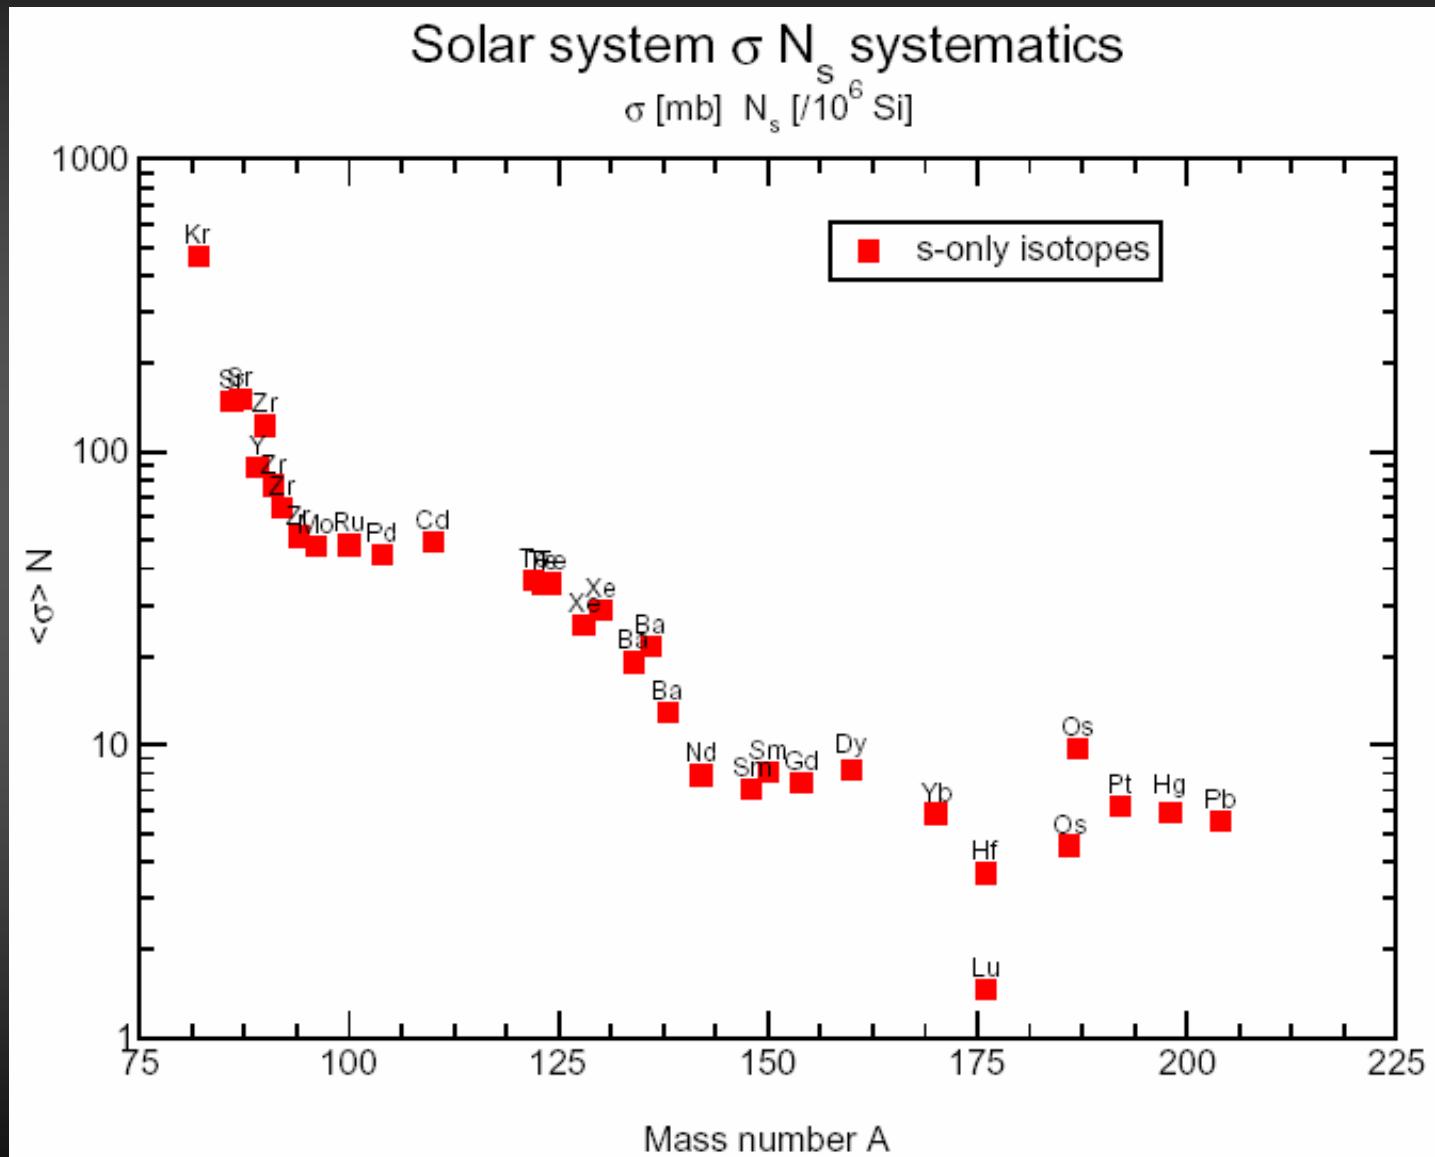

ii) $\lambda_\beta \ll \lambda_{n,\gamma}$ (neutron capture dominates over β -decay)

$$\frac{dN_A}{d\tau} = \langle\sigma_{n,\gamma}\rangle_{A-1} N_{A-1} - \langle\sigma_{n,\gamma}\rangle_A N_A$$

It follows that along the s-process path:

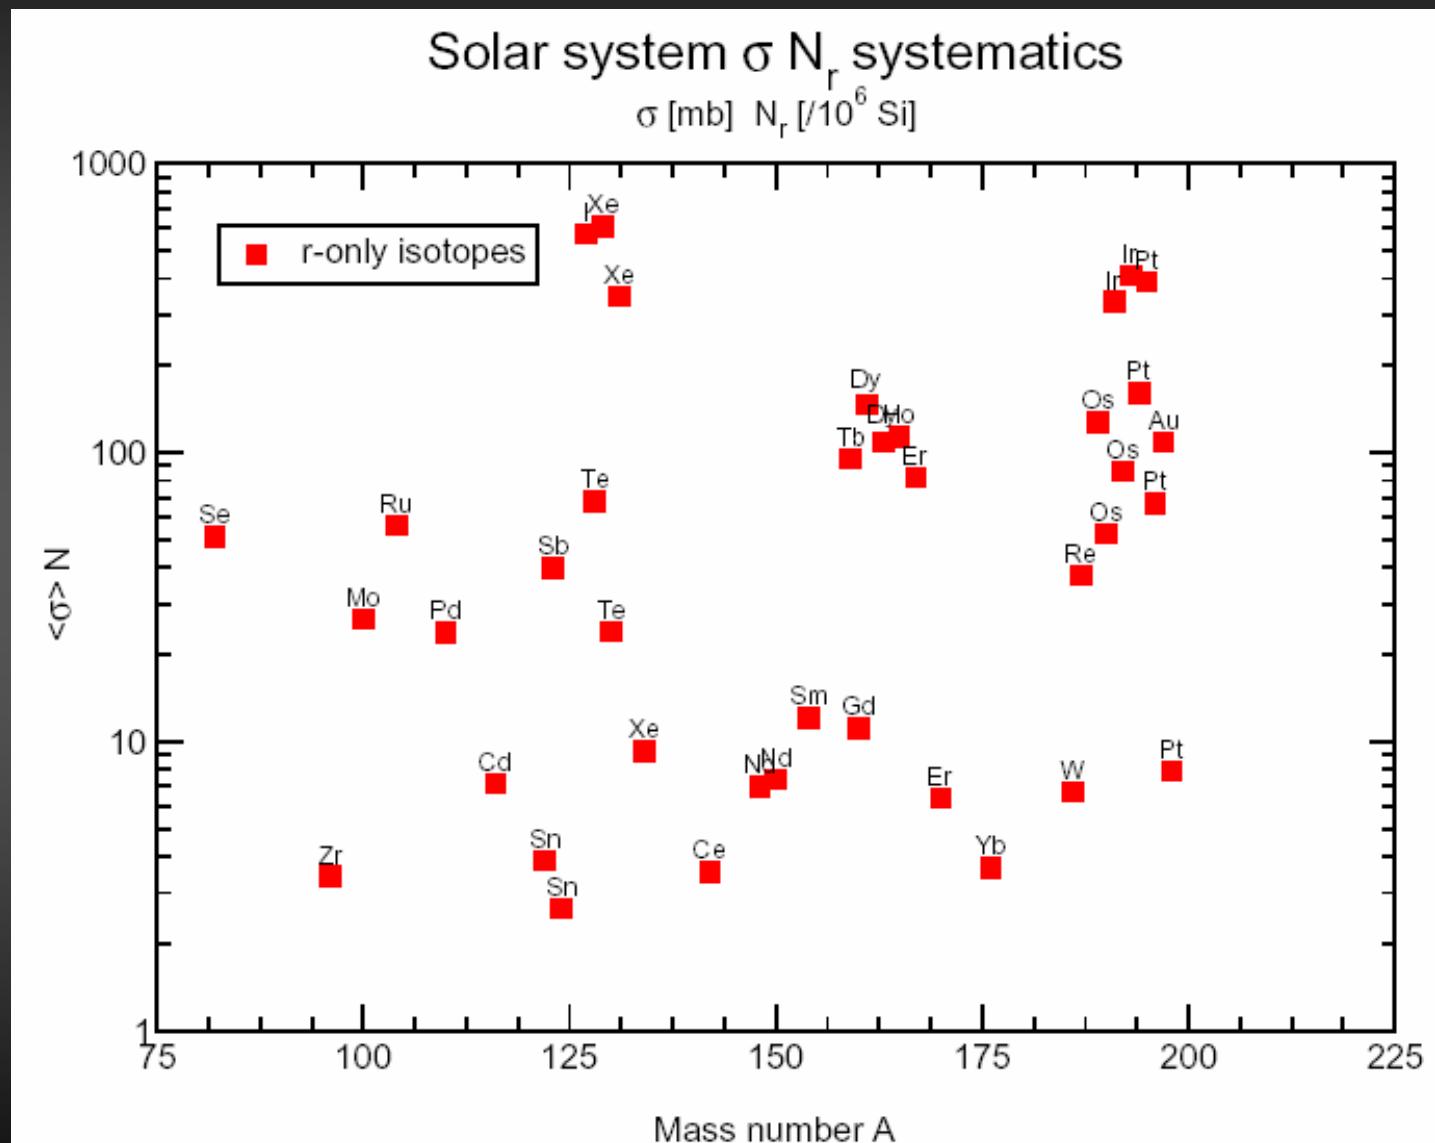

$$\boxed{\langle\sigma_{n,\gamma}\rangle_{A-1} N_{A-1} = \langle\sigma_{n,\gamma}\rangle_A N_A = const.}$$

The canonical s-process

The canonical s-process

No $\langle\sigma\rangle N$ correlation observed for nuclei **not** in the s-process path

The canonical s-process

Assuming an exponential distribution of neutron exposures:

$$\rho(\tau) = \frac{f N_{56}}{\tau_0} e^{\tau/\tau_0}$$

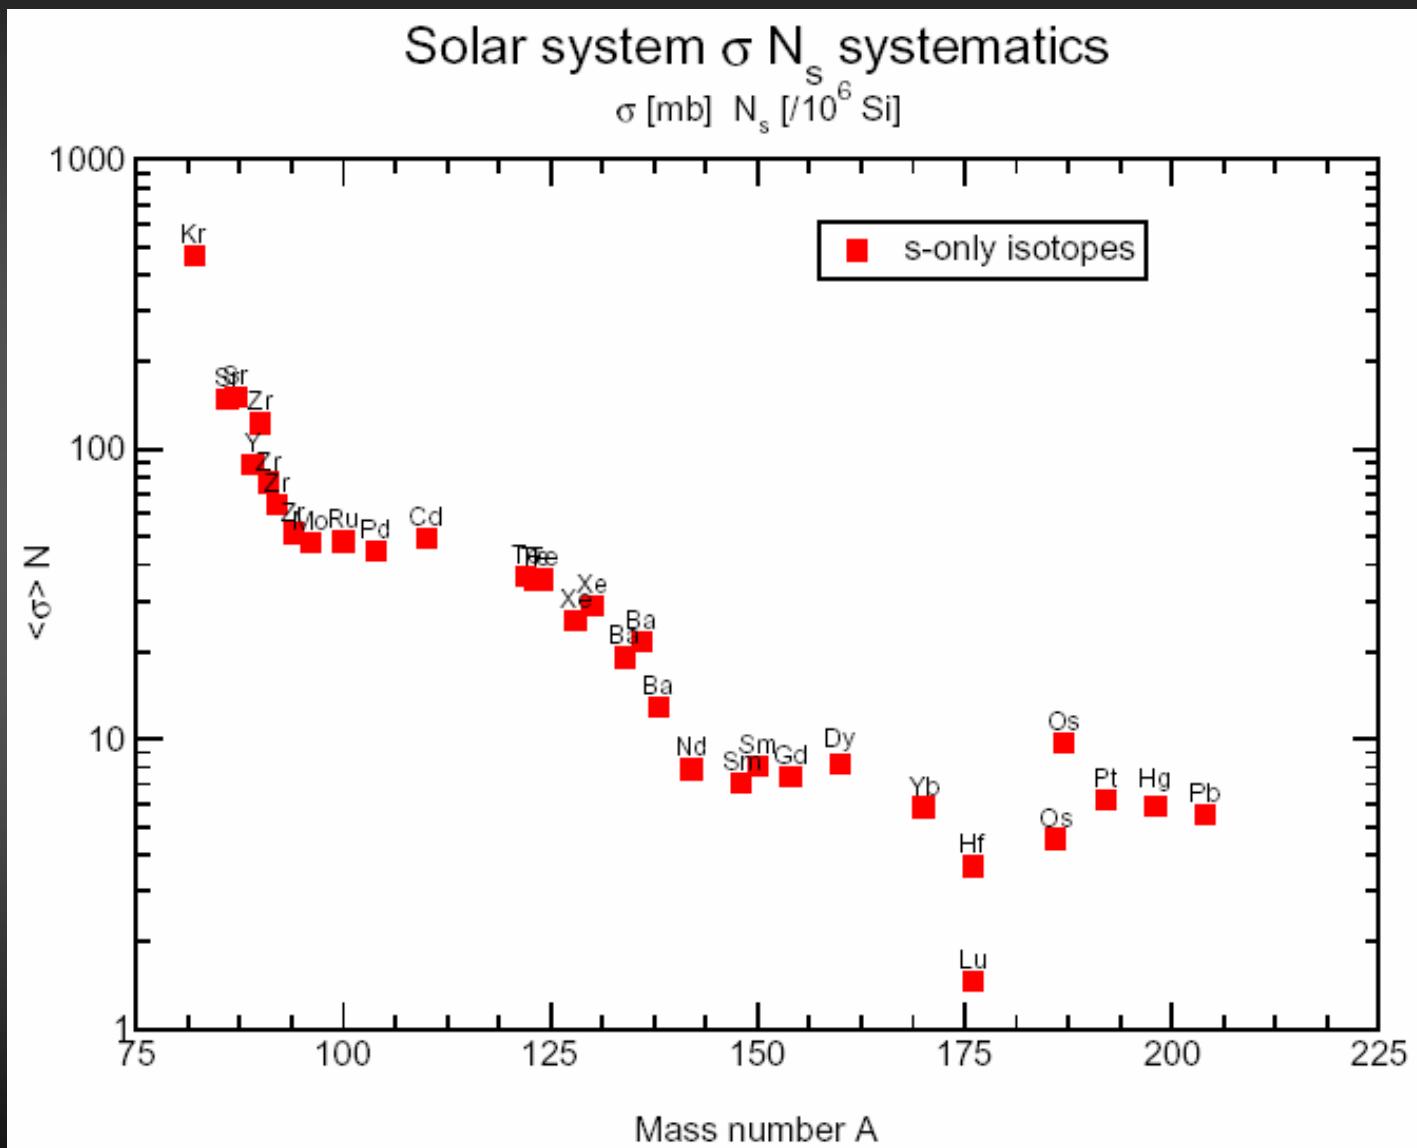

the solution of the coupled system of equations

$$\frac{dN_A}{d\tau} = \langle \sigma_{n,\gamma} \rangle_{A-1} N_{A-1} - \langle \sigma_{n,\gamma} \rangle_A N_A$$

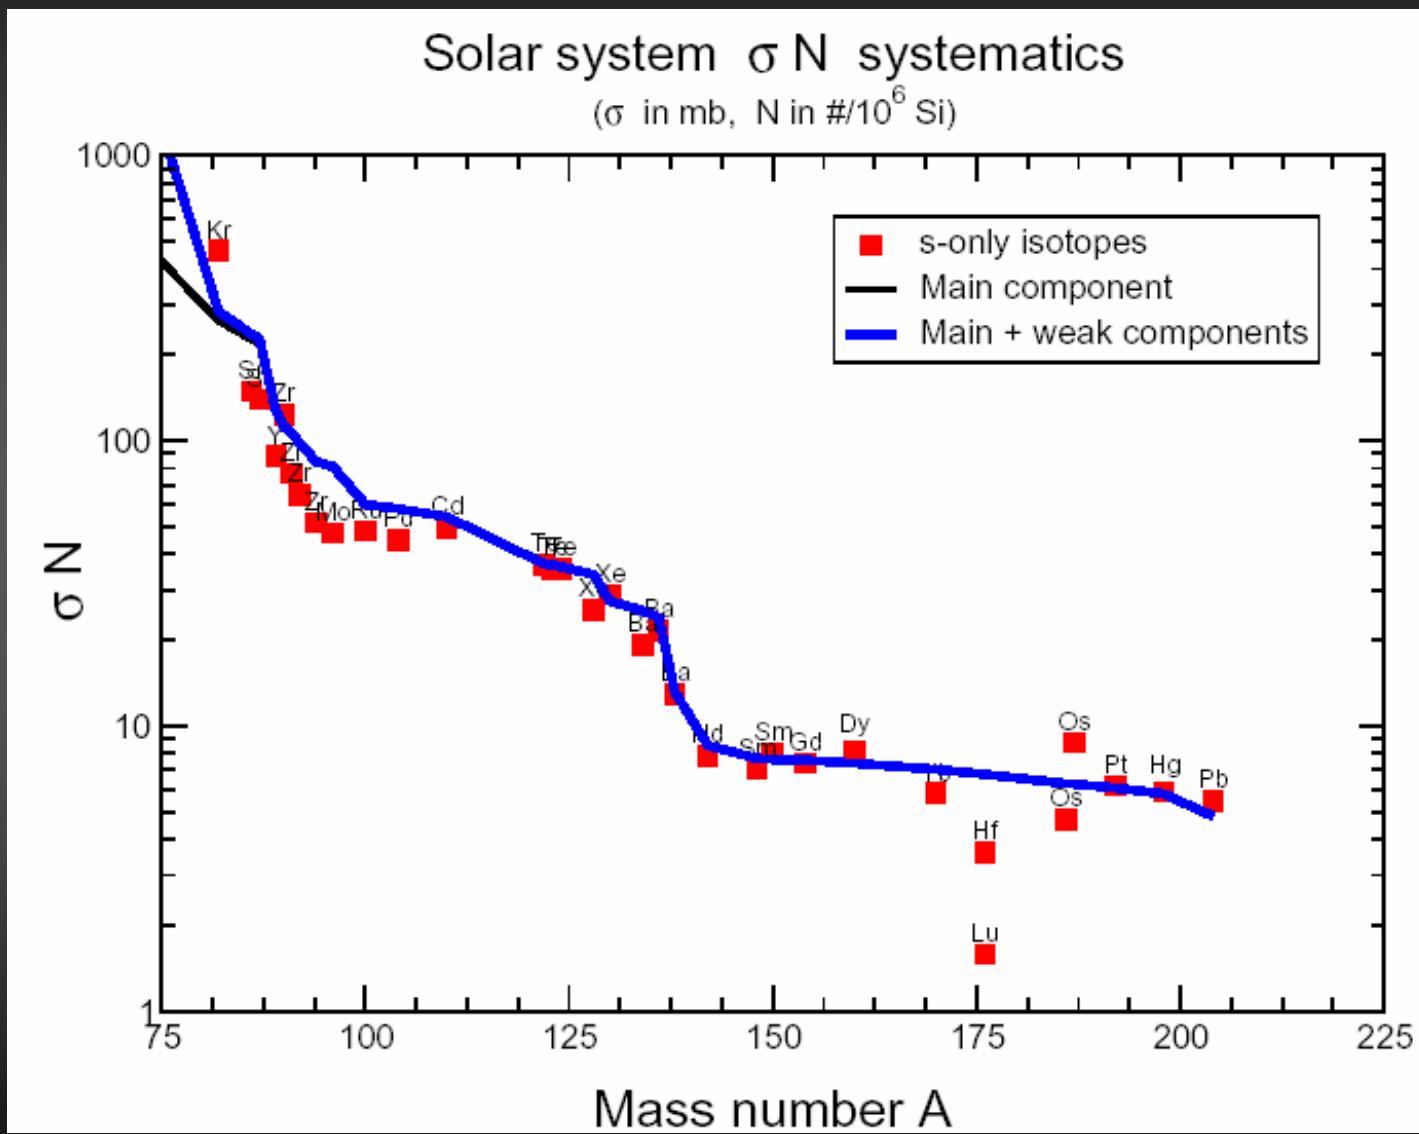

is

$$\boxed{\langle \sigma \rangle_A N_A = \frac{\langle \sigma \rangle_{A-1} N_{A-1}}{1 + 1/\tau_0 \langle \sigma \rangle_A} = \frac{f N_{56}}{\tau_0} \prod_{i=1}^A \left(1 + \frac{1}{\tau_0 \langle \sigma \rangle_i} \right)^{-1}}$$

F Käppeler (Prog. Part. Nucl. Phys. 43, 1999)

weak: core He burning in massive stars (e.g. 25 solar masses)

main: He shell flashes in low mass TP-AGB stars

The problem

- Nuclear power now accounts for 4.5% of total world's energy production. Already at this level the accumulated spent fuel inventory, at the yearly production rate of 8,000 ton, will reach by 2020 about 200,000 ton
- NB: the Yucca Mountain deep underground repository in the US has a capacity of 70,000 ton and a cost of 15 G\$
- Assuming by 2050 a substantial classic nuclear contribution to heal the greenhouse effect ($\approx 30\%$ of the projected, increased world's power consumption or $+2.3\%/\text{yr}$), the yearly waste production would be of 100,000 ton/y: fill a Yucca Mountain type of repository every 8 months!
