  - **recent results**

The EMC "Spin Crisis"

$$g_1(x) = \frac{1}{2} \sum_q e_q^2 \left(q^+(x) - q^-(x) \right) = \frac{1}{2} \sum_q e_q^2 \Delta q(x)$$

Up to standard pQCD coefficients (series in $\alpha_s(Q^2)$):

$$\int_0^1 dx\, g_1^p(x) = \underline{(\Delta u - \Delta d)}/12 + \underline{(\Delta u + \Delta d - 2\Delta s)}/36$$

$$+ \underline{(\Delta u + \Delta d + \Delta s)}/9 \qquad \text{(up to QCD radiative corrections)}$$

g^3_A : from β decay of n
g^8_A : hyperon β decay

naively fraction of proton **'spin' carried by its quarks**

$$\Sigma_{inv} \equiv \Sigma\, (Q^2 = \infty)$$

$\Delta u \equiv$ **fraction of proton spin carried by u and anti-u quarks, etc..**

Office of Science

U.S. DEPARTMENT OF ENERGY

What do we expect ?

Most quark models start with 3 quarks in the 1s-state
of a confining potential: proton spin is ALL carried
by its quarks $\Rightarrow \Sigma = 100\%$

N.B. Given low values of $m_{u,d}$ the quark motion is relativistic
and lower Dirac components have spin down $\Rightarrow \Sigma \sim 65\%$

Ancient History of the Spin Crisis

A MEASUREMENT OF THE SPIN ASYMMETRY AND DETERMINATION OF THE STRUCTURE FUNCTION g_1 IN DEEP INELASTIC MUON–PROTON SCATTERING

European Muon Collaboration

Aachen, CERN, Freiburg, Heidelberg, Lancaster, LAPP (Annecy), Liverpool, Marseille, Mons, Oxford, Rutherford, Sheffield, Turin, Uppsala, Warsaw, Wuppertal, Yale

J. ASHMAN [a], B. BADELEK [b,1], G. BAUM [c,2], J. BEAUFAYS [d], C.P. BEE [e], C BENCHOUK [f],

(93 authors)

The spin asymmetry in deep inelastic scattering of longitudinally polarised muons by longitudinally polarised protons has been measured over a large x range ($0.01 < x < 0.7$). The spin-dependent structure function $g_1(x)$ for the proton has been determined and its integral over x found to be $0.114 \pm 0.012 \pm 0.026$, in disagreement with the Ellis–Jaffe sum rule. Assuming the validity of the Bjorken sum rule, this result implies a significant negative value for the integral of g_1 for the neutron. These values for the integrals of g_1 lead to the conclusion that the total quark spin constitutes a rather small fraction of the spin of the nucleon.
$$\Sigma = 14 \pm 3 \pm 10 \ \% :$$

i.e. 86% of spin of p NOT carried by its quarks

SPIN STRUCTURE OF THE NUCLEON AND TRIANGLE ANOMALY

25 May 1988

Operated by Jefferson Science Associates for the U.S. Department of Energy
THE ANOMALOUS GLUON CONTRIBUTION TO POLARIZED LEPTOPRODUCTION

G. ALTARELLI and G.G. ROSS [1]

CERN, CH-1211 Geneva 23, Switzerland

We show that, due to the anomaly, the gluon contribution to the first moment of the polarized proton structure function, as measured in deep inelastic scattering, is not suppressed by a power of the strong coupling evaluated at a large scale. As a result, the EMC result for the first moment of polarized proton electroproduction is consistent with a large quark spin component.

$$\Sigma_{\text{naïve}} \rightarrow \Sigma_{\text{naïve}} - N_f \frac{\alpha_s (Q^2)}{2 \pi} \Delta G (Q^2)$$

and

Fig. 1. Diagrams contributing to a finite mixing of order α_s between g_1^p and the polarized gluon parton density.

QCD evolution $\Rightarrow \alpha_s(Q^2) \Delta G(Q^2)$ does not vanish as $Q^2 \rightarrow \infty$

and polarized gluons would resolve crisis   **HOW MUCH?**
Operated by Jefferson Science Associates for the U.S. Department of Energy

Scale of the Gluon Contribution

At 3 GeV^2 $\alpha_s \sim 0.3$

and N$_f$ = 3, so IF all of the

N spin carried by quarks is

cancelled by gluons:

$$\Delta G = + \frac{2 * \pi * 1}{3 * 0.3} \sim + 6$$

…actually ΔG $\sim$ + 4 better
- a truly remarkable result

for which no physical explanation was ever offered

This spurred a tremendous experimental effort

- DIS measurements of spin structure functions
  of polarized p, d, ^{3}He (and ^{6}Li) at
  SLAC, CERN, Hermes, JLab

- Direct search for high-p_T hadrons at
  Hermes, COMPASS, RHIC to directly
  search for effects of polarized glue in the p

- This effort has lasted the past 20 years,
  with great success

One-Gluon-Exchange Correction

Spin structure functions and gluon exchange

F. Myhrer

Department of Physics and Astronomy, University of South Carolina, Columbia, South Carolina 29208

A. W. Thomas

Department of Physics and Mathematical Physics, University of Adelaide, Adelaide, South Australia 5000, Australia
and Department of Theoretical Physics, Oxford University, Oxford OX1 3NP, Oxfordshire, England*
(Received 13 June 1988)

Two-quark correlations due to gluon exchange give corrections to both the proton and neutron spin-dependent structure functions in the Bjorken sum rule. They are found to be as large as the pionic corrections in the cloudy bag model of the nucleon. While still not enough to explain the result published recently by the European Muon Collaboration, it is compatible with the reanalysis of the data by Close and Roberts.

# SU(6) violations due to one-gluon exchange

H. Høgaasen

Fysisk Institutt, University of Oslo, Blindern, 0316 Oslo 3, Norway

F. Myhrer

Department of Physics, University of South Carolina, Columbia, South Carolina 29208
(Received 26 October 1987)

The one-gluon-exchange corrections to the baryon magnetic moments and the weak semileptonic decays are shown to have the correct two-body operator in order to explain recent data. An explicit model calculation using a mode sum for the quark propagator is then performed. In this model calculation the two lowest states dominate the corrections. This value of SU(6) breaking explains the measured ratio $\Sigma^- \rightarrow n e \bar{\nu} / \Lambda \rightarrow p e \bar{\nu}$ as well as why $\mu_{\Xi^-} < \mu_\Lambda$ and it restores $\mu_p / \mu_n \simeq -\frac{3}{2}$ in chiral bag models.

The Pion Cloud of the Nucleon
- required by chiral symmetry

SPIN DEPENDENT STRUCTURE FUNCTIONS IN THE CLOUDY BAG MODEL

A.W. SCHREIBER AND A.W. THOMAS

Department of Physics and Mathematical Physics, University of Adelaide,
North Terrace, Adelaide, South Australia 5000, Australia

We derive expressions for the integrals of the spin dependent structure functions $g_1(x)$ for the proton and the neutron in the context of the cloudy bag model. We find that the neutron contributes 5–10% to the Bjorken sum rule, while there is a corresponding decrease for the proton's contribution. It is difficult to reconcile these results with those reported in a recent experiment.

Operated by Jefferson Science Associates for the U.S. Department of Energy

Effect of the Pion Cloud

- **Probability to find a bare N is Z ~ 70%**

- **Biggest Fock Component is N π ~ 20-25% and 2/3 of time N spin points down**

- **Next biggest is $\Delta\pi$ ~ 5-10%**

$$L_z=+1 \qquad L_z=0$$

$$Z \qquad \frac{2}{3}P_{N\pi} \qquad \frac{1}{3}P_{N\pi}$$

- **To this order (i.e. including terms which yield LNA and NLNA contributions):**

- **Spin gets renormalized by a factor :**

$$Z - \frac{1}{3}P_{N\pi} + \frac{15}{9}P_{\Delta\pi} \sim 0.75 - 0.8$$

$$\Rightarrow \Sigma = 0.65 \rightarrow 0.49 - 0.52$$

Support for Pion Cloud Picture

- **Most spectacular example is the <u>prediction</u>[*]**
 **of $\bar{d} > \bar{u}$, because of the pion cloud ($p \to n\,\pi^+$)**

$$\int_0^1 dx\,[\,\bar{d} - \bar{u}\,] = 2\,P_{N\pi}/3 - P_{\Delta\pi}/3$$
$$\in 0.11 - 0.15$$

(in excellent agreement with latest data)

U.S. DEPARTMENT OF ENERGY

Can one add OGE and Pion Corrections?

- **Prime phenomenological need for OGE interaction is the hyperfine splitting of N and Δ masses, Λ and Σ masses, etc. – i.e. hadron spectroscopy**

- **In early days of chiral models believed some of this hyperfine splitting came from pion self-energy differences**

- **Maybe double counting to include correction to Σ from both pions and OGE??**

- **Modern understanding *NO*: from analysis of data in quenched (QQCD) and full QCD, from Lattice QCD - implies 50 MeV (or less) of $m_\Delta - m_N$ in this way**

**Young et al., Phys. Rev. D66 (2002) 094507**

Nucleon - Δ Splitting

Lattice analysis
⇒ pions give 40 ± 20 MeV

PHYSICAL REVIEW D **66**, 094507 (2002)

• **Hence most of the N-Δ splitting comes from OGE – as in most quark models**

• **Thus the value of α_s used in the bag model calculation of the exchange current correction is more or less unchanged**

• **and… one can add the pion and OGE corrections to the spin sum-rule**

Final Result for Quark Spin

$$\Sigma = (\ Z - P_{N\pi}/3 + 5 \ P_{\Delta\pi}/3) \times (0.65 - 3 \ G)$$

$$= (0.7, 0.8) \times (0.65 - 0.15) = (0.35, 0.40)$$

c.f. Experiment: 0.33 ± 0.03 ± 0.05

• **ALL effects, relativity and OGE and the pion cloud**

have the effect of swapping quark spin for valence

orbital angular momentum and anti-quark orbital

angular momentum (>60% of the spin of the proton)

Myhrer & Thomas, hep-ph/0709.4067

The Balance Sheet – <u>fraction</u> of total spin

Experimental Constraints: Already at 6 GeV

Within model of Vanderhaeghen and collaborators…. model dependence?
Comparison with model of Myhrer & Thomas

(from: hep-ph/0803.2775)

Mazouz et al. (JLab), PRL 99, 242501 (2007)

Summary

- **Two decades of experiments have given us important new insight into spin structure of the p**

- **U(1) axial anomaly appears to play little role in resolving the problem**
  - **not as severe as in original EMC paper**

- **Instead, important details of the non-perturbative structure of the nucleon DO resolve the "crisis"**
  - **OGE hyperfine interaction**
  - **chiral symmetry: pion cloud**
  - **relativistic motion of quarks**

**Ingredients of a minimal description of proton structure**

Summary

- **Important consequence for quark model:
  significant orbital angular momentum carried
  by valence quarks and anti-quarks in the proton**

- **Effect of QCD Evolution is to:**
  - **flip ordering of L^u and L^d**
  - **severely reduce the magnitude of orbital
    angular momentum**
  - **restore agreement between data, LQCD and
    Myhrer-Thomas explanation of the spin crisis**

- **Study of GPDs at JLab provide the primary tool
  to verify this (maybe transversity too?)**

Evolution Equations - singlet

$$\Delta\Sigma(t) = \text{const},$$

$$\Delta g(t) = -\frac{4\Delta\Sigma}{\beta_0} + \frac{t}{t_0}\left(\Delta g_0 + \frac{4\Delta\Sigma}{\beta_0}\right)$$

$$\frac{d}{dt}\begin{pmatrix} L_q \\ L_g \end{pmatrix} = \frac{\alpha_s(t)}{2\pi}\begin{pmatrix} -\frac{4}{3}C_F & \frac{n_f}{3} \\ \frac{4}{3}C_F & -\frac{n_f}{3} \end{pmatrix}\begin{pmatrix} L_q \\ L_g \end{pmatrix}$$

$$+ \frac{\alpha_s(t)}{2\pi}\begin{pmatrix} -\frac{2}{3}C_F & \frac{n_f}{3} \\ -\frac{5}{6}C_F & -\frac{11}{2} \end{pmatrix}\begin{pmatrix} \Delta\Sigma \\ \Delta g \end{pmatrix}$$
$$L_q(t) = -\frac{1}{2}\Delta\Sigma + \frac{1}{2}\frac{3n_f}{16+3n_f}$$

$$+ (t/t_0)^{-2(16+3n_f)/9\beta_0}$$

$$\times\left(L_q(0) + \frac{1}{2}\Delta\Sigma - \frac{1}{2}\frac{3n_f}{16+3n_f}\right),$$

$$L_g(t) = -\Delta g(t) + \frac{1}{2}\frac{16}{16+3n_f}$$

$$+ (t/t_0)^{-2(16+3n_f)/9\beta_0}$$

$$\times\left(L_g(0) + \Delta g(0) - \frac{1}{2}\frac{16}{16+3n_f}\right).$$

Non-singlet Equations for Individual Flavors

$$L^{u-d}(t) + \frac{\Delta u - \Delta d}{2} = \left(\frac{t}{t_0}\right)^{-\frac{32}{9\beta_0}} \left(L^{u-d}(t_0) + \frac{\Delta u - \Delta d}{2}\right)$$

Also solve for non-singlet: $L^{u+d} - 2L^s$

$$\Rightarrow \quad L^{u(d)} = -\frac{\Delta u}{2}\left(-\frac{\Delta d}{2}\right) + 0.06$$

$$+ \frac{1}{3}\left(\frac{t}{t_0}\right)^{-\frac{50}{81}}\left[L^{u+d}(t_0) + \frac{\Sigma}{2} - 0.18\right]$$

$$+ \frac{1}{6}\left(\frac{t}{t_0}\right)^{-\frac{32}{81}}\left[L^{u+d}(t_0) \pm 3L^{u-d}(t_0) \pm g_A^{(3)} + \frac{\Sigma}{2}\right]$$
