

I mostly use GPS to study how the Earth changes. I study plate tectonics, volcanoes, and earthquakes.

GPS monitoring

- monumentation on rock

- antenna forced centering with sub-millimetre repeatability (*ad hoc* designed antenna mount, thoroidal level for vertical positioning)

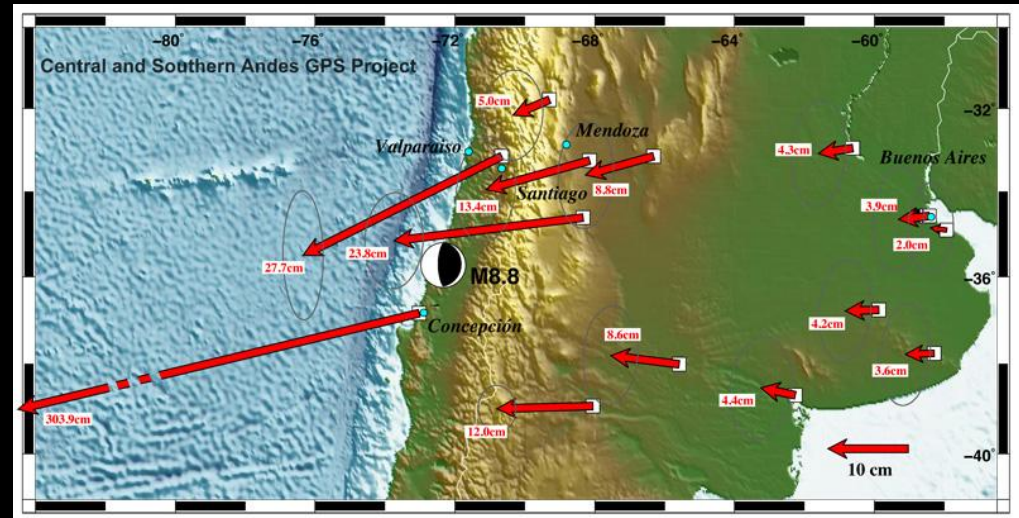

- spirit levelling on each site to check for local vertical stability

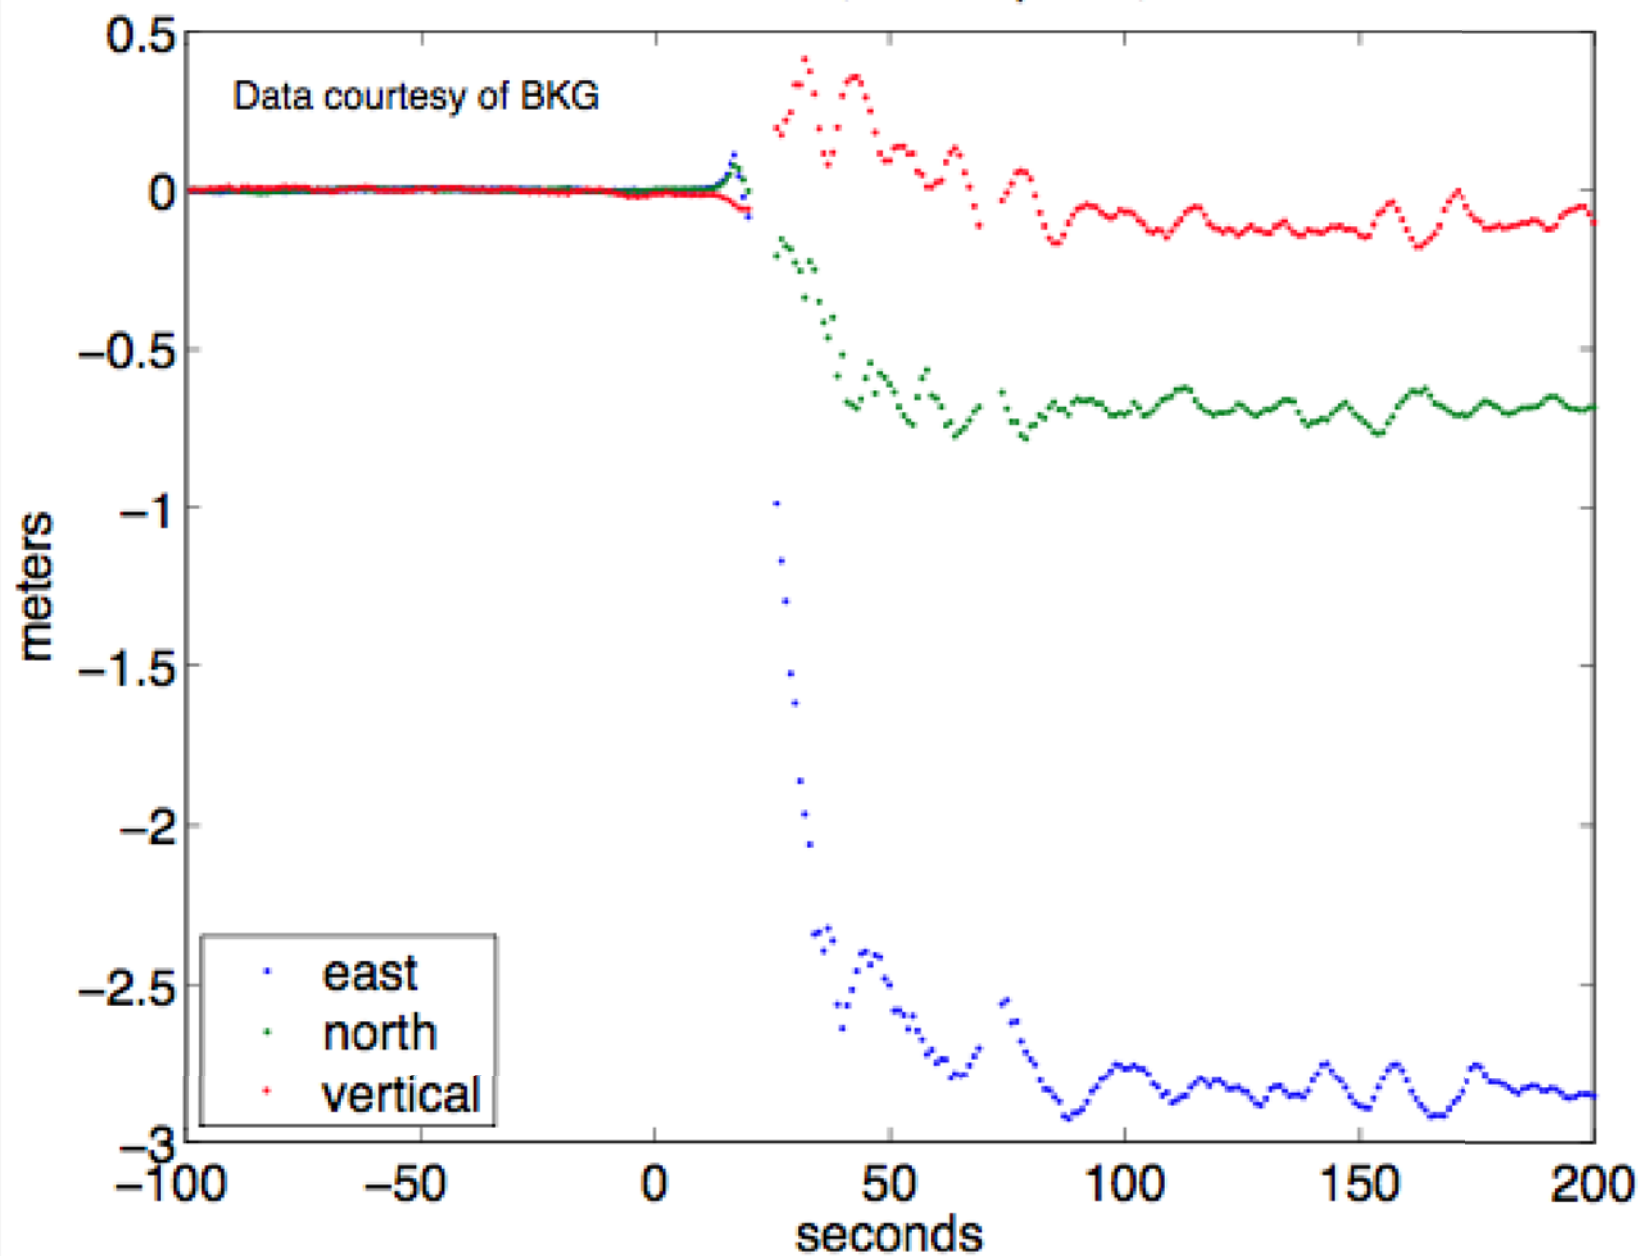

How much did the Earth deform during the recent earthquake in Chile?

1-Hz GPS Site, Concepcion, Chile

Launched and Planned Radar Satellites

The Future

Sentinel-1 (ESA, GMES)

- Funded, Launch 2012

The Future

NASA:

- Funding not yet confirmed
- Proposed launch 2010-2013

The Future

“InSAR everywhere,
all the time”

The alternative to satellite monitoring
