Workshop on Aerosol Impact in the Environment: from Air Pollution to Climate Change

8 - 12 August 2011

Numerical modeling for air quality at regional scale: the aerosol challenge

D. Giaiotti ARPA FVG, Palmanova Italy

Numerical modeling for air quality at regional scale: the aerosol challenge.

by Giaiotti Dario B. & Stel Fulvio

Regional Agency for Environmental Protection of Friuli Venezia Giulia (ARPA FVG) Regional Center for Environmental Modeling (CRMA)

Trieste, August 11, 2011

Outline of the presentation

- Particulate matter: what and why; the synergy between regulations and science.
- Simulations should answer the relevant questions: what are such questions?
- Domains and numerical models: how to use the proper tool.
- Necessary inputs for particulate matter simulations at regional scale.
- Prognostic and diagnostic simulations: same tools, but different work flows.
- New computational approaches: GRID computing

Particulate matter for regional air quality simulations

The focus of air quality simulations at regional scale for aerosols is on **Particulate** Matter.

EEA definition (EEA Glossary http://www.eea.europa.eu)

Aerosol: "A collective name for fine solid or liquid particles added to the atmosphere by processes at the earth's surface."

Particulate Matter (PM): "Particulate matter includes dust, smoke, soot, pollen and soil particles."

<u>EPA definition</u> (EPA Glossary http://www.epa.gov/climatechange/glossary.html) **Aerosol**: "A collection of airborne solid or liquid particles, with a typical size between 0.01 and 10 micrometers (µm) and residing in the atmosphere for at least several hours." **Particulate Matter (PM)**: "Very small pieces of solid or liquid matter such as particles of soot,

dust, fumes, mists or aerosols."

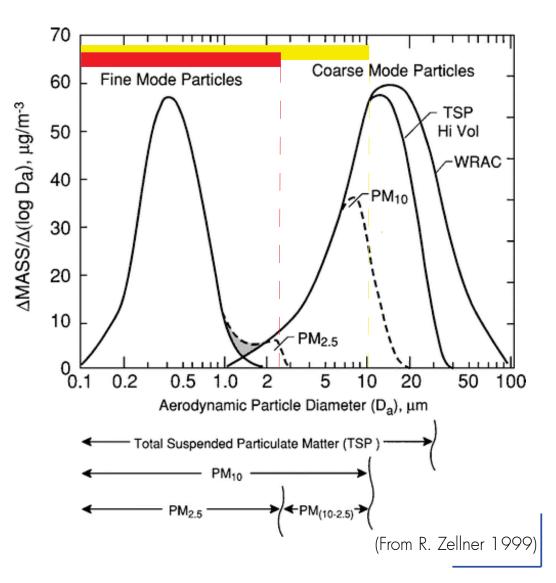

Particulate matter and the aerosol size spectra

The focus is on: **PM10** and **PM2.5** EC directive 50/2008 (article 2) gives the definitions:

PM10 shall mean particulate matter which passes through a size-selective inlet as defined in the reference method for the sampling and measurement of PM10, EN 12341, with a 50 % efficiency **cut-off at 10 µm** aerodynamic diameter.

PM2.5 shall mean particulate matter which passes through a size-selective inlet as defined in the reference method for the sampling and measurement of PM2.5, EN 14907, with a 50 % efficiency **cut-off at 2.5 μm** aerodynamic diameter.

[2008/50/EC is a directive of the European Parliament and of the Council of the European Union]

Why the focus on PM10 and PM2.5

The EC and national laws recognize PM10 and PM2.5 have impacts on human health. This comes from scientific evidences.

EC " ... establishes the need to reduce pollution to levels which minimise <u>harmful effects on human</u> <u>health</u>, paying particular attention to sensitive populations, and <u>the environment as a whole</u>, to <u>improve the monitoring and assessment</u> of air quality including the deposition of pollutants and to provide information to the public." [1]

The EC directive 50/2008 confirms the need to limit PM10 concentration and it highlights the PM2.5 impacts on human health:

"Fine particulate matter (PM2.5) is responsible for significant negative impacts on human health. Further, there is as yet no identifiable threshold below which PM2.5 would not pose a risk. As such, this pollutant should not be regulated in the same way as other air pollutants." [1]

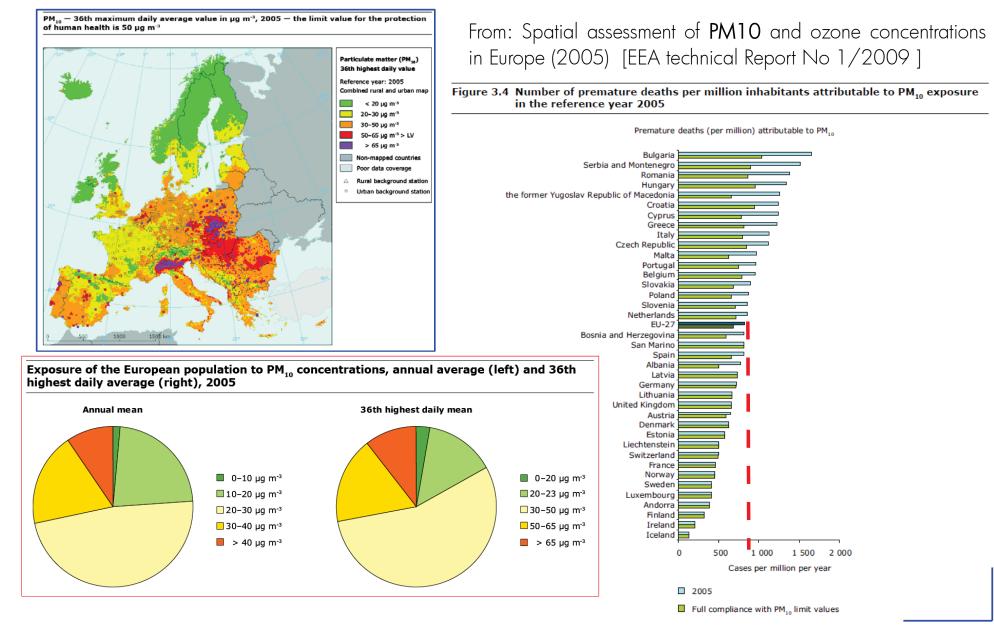

HUMAN HEALTH	Limit or target ^(t) value						Assessment threshold values	
Pollutant	Averaging period	Value	Maximum number of	Margin of tolerance	Date applicable	Upper	Lower	
PM ₁₀	Day Year	50 μgm ⁻³ 40 μgm ⁻³	35 0	50% 20%	2010 2010	35 μgm ⁻³ 28 μgm ⁻³	25 μgm ⁻³ 20 μgm ⁻³	
PM _{2.5}	Year	25 μgm ⁻³ 25 μgm ^{-3 (t)}	0 0	20% in 2008 to 0% in 2015	2015 2010	17 μgm-3	12 μgm- ³	

[1] Incipit of the 2008/50/EC which is a directive of the European Parliament and of the Council of the European Union

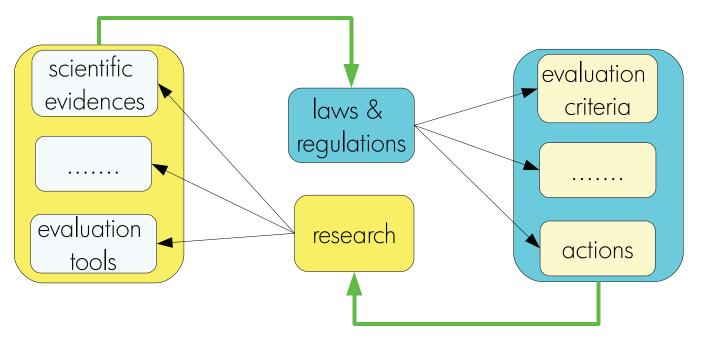

The scientific evidences of PM10 and PM2.5 impacts on human health.

The synergy between regulations and science

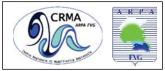

Nowadays model simulations are considered reliable evaluation tools as measurements.

"Where possible modelling techniques should be applied to enable point data to be interpreted in terms of geographical distribution of concentration. This could serve as a basis for calculating the collective exposure of the population living in the area." [1]

"The results of modelling and/or indicative measurement shall be taken into account for the assessment of air quality with respect to the limit values." [1]

[1] In the 2008/50/EC which is a directive of the European Parliament and of the Council of the European Union

The proper simulations for particulate questions at regional scale

It is necessary to project and execute numerical simulations suitable to answer the given questions, keeping in mind the limits of the models and the inputs.

How to chose the right tool?

FAIRMODE (http://fairmode.ew.eea.europa.eu/) is an initiative involving a lot of research and environmental institutions allover Europe and it is a very good reference source of information to learn how to chose the right tool (**numerical model**).

FAIRMODE aims:

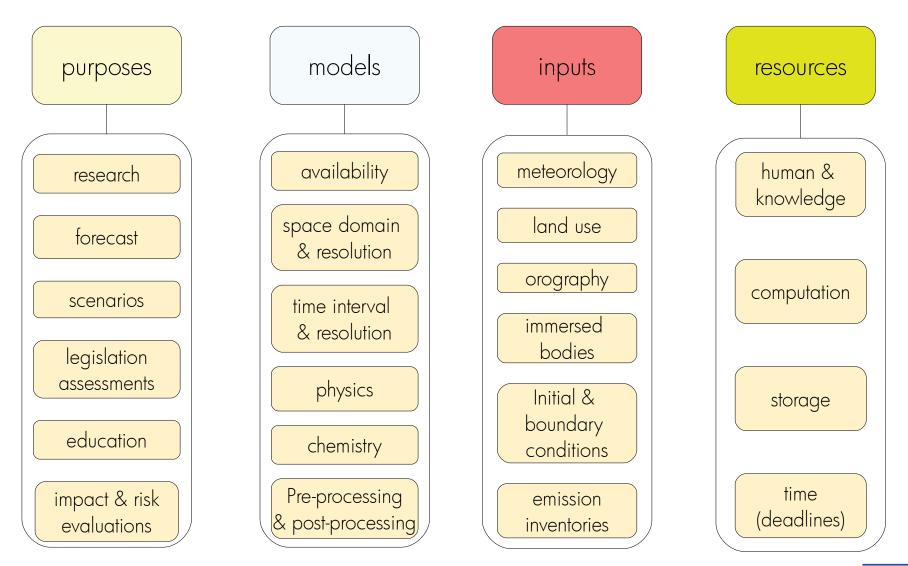

- to provide <u>guidance for the use</u> of air quality modeling in regard to the European Air Quality Directives: interpretation, reference and summary information <u>for both authorities and</u> <u>researchers</u>.
- to promote good practice in air quality modeling and assessment,
- to provide a central reference point and develop a harmonized understanding of model requirements in regard to the European Air Quality Directive.

Basic steps to project a suitable simulation for particulate matter at regional scale

There are four main aspects to be considered to project a useful simulation

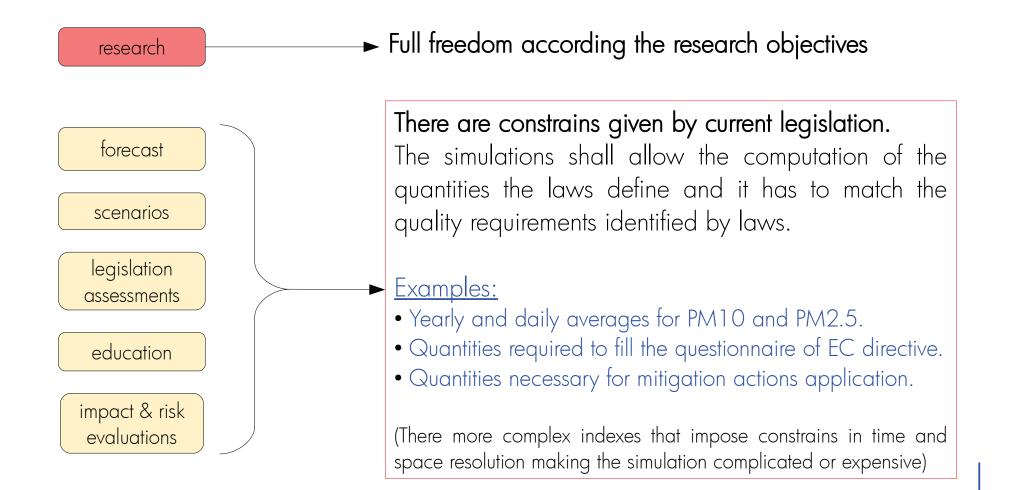

Main aspect of the purposes class

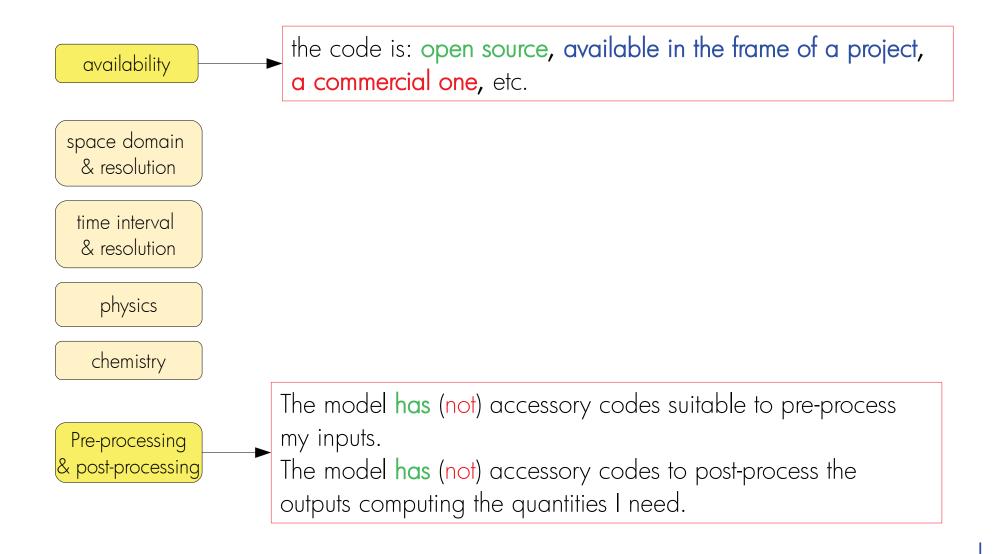

There is an essential distinction among all the purposes for an air quality simulation:

Models: availability, pre-processing and post-processing

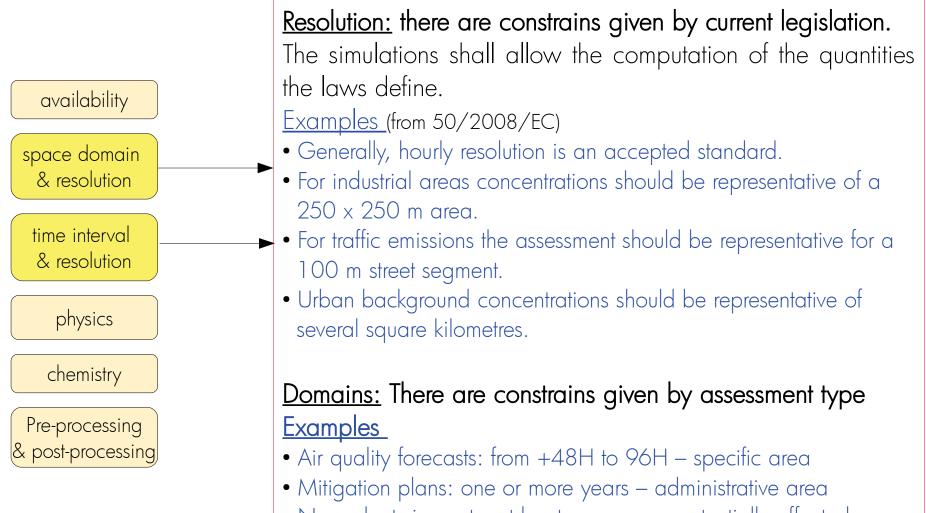

Models: phys & chem		Area of assessment					
	Description	Local/hotspot (1 – 1000 m)	Urban/agglomerate (1 – 300 km)	Regional (25 – 10 000 km)			
availability	Model type	Gaussian and non-Gaussian parameterised models Statistical models Obstacle resolving fluid dynamical models Lagrangian particle models	Gaussian and non-Gaussian parameterised models Eulerian chemical transport models Lagrangian particle models	Eulerian chemical transport models Lagrangian chemical models			
space domain & resolution time interval	Meteorology	Local meteorological measurements Obstacle resolving fluid dynamical models Diagnostic wind field models	Mesoscale meteorological models Localised meteorological measurements Diagnostic wind field models	Synoptic/mesoscale meteorological models			
& resolution	Chemistry	Parameterised or none	Ranging from none to comprehensive, depending on application	Comprehensive			
physics	Emission modelling	Bottom up traffic emissions Source specific emissions	Bottom up and/or top down emission modelling Emission process models	Top down emission modelling Emission process models			
	Compound	Local/hotspot	Urban/agglomerate	Regional/continental			
Pre-processing & post-processing Source: FAIRMODE " Guidance	PM ₁₀	No chemical processes	Deposition Secondary inorganic particle formation	Deposition Primary (combustion) particles Secondary inorganic and organic particle formation Suspended dust Sea salt			
on the use of models for the European Air Quality Directive, ETC/ACC", Bruce Denby, 2010	PM _{2.5}	No chemical processes	Deposition Secondary inorganic particle formation	Deposition Secondary inorganic and organic particle formation			

Models: domains and resolutions for space and time

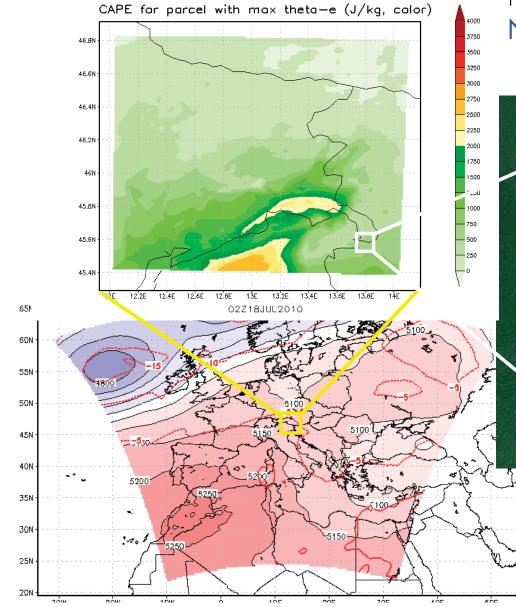

• New plants impacts: at least one year – potentially affected area

> 4550 4500

Examples of domains

From continental scale down to local scale Nesting is a common practice

Available guidance tools for numerical models selections

A comprehensive listing of air quality models used in Europe can be found at:

- EIONET Model Documentation System http://air-climate.eionet.europa.eu/databases/MDS/index_html
- COST728

http://www.mi.uni-hamburg.de/Model-Inventory.6295.0.html?&no_cache=1

Emission modelling tools list and description can be found in:

• EMEP/EEA air pollutant emission inventory guidebook

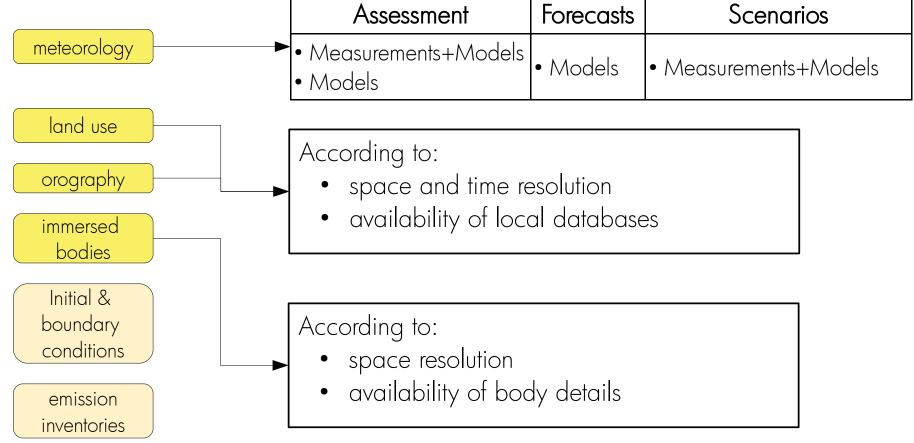

http://www.eea.europa.eu/publications/emep-eea-emission-inventory-guidebook-2009

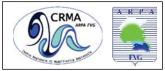

Inputs: meteorology, land use, orography and immersed bodies

The choice has to be made according to:

- models features and sensibilities
- simulation type
- regulation constrains

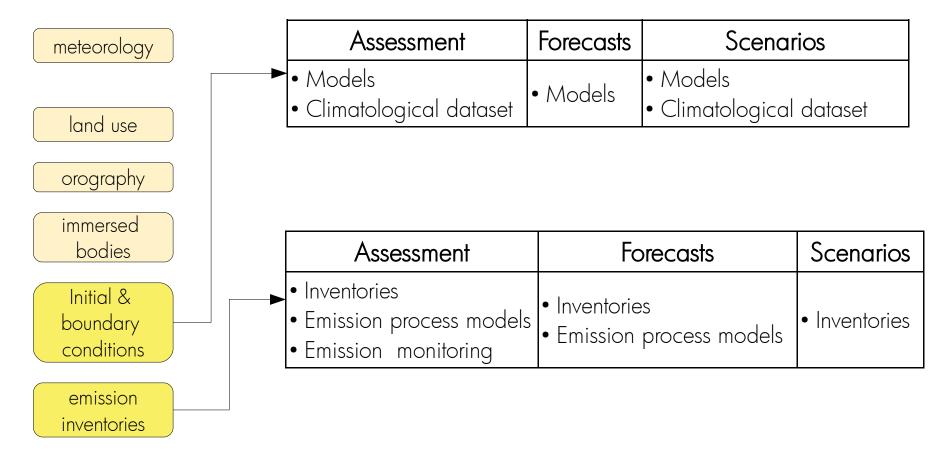

Inputs: initial, boundary conditions and emission sources

The choice has to be made according to:

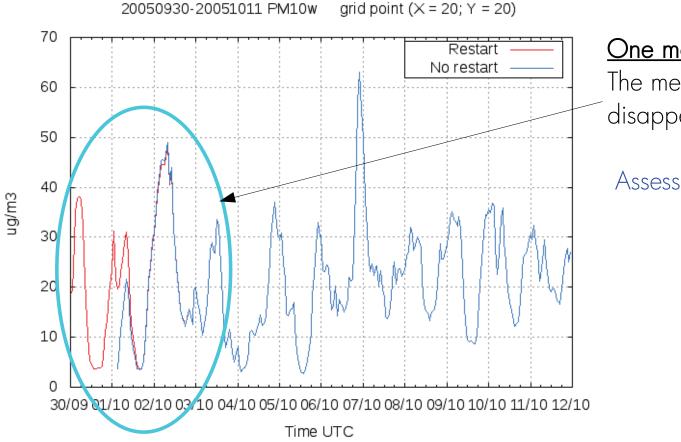

- models features and sensibilities
- simulation type
- regulation constrains

Example of initial conditions influences on Friuli Venezia Giulia domain

- Eulerian chemical transport model (FARM ®Arianet) domain 160 km × 160 km resolution 4 km
- Regional scale emission inventory
- Climatological boundary conditions

<u>One month simulation</u>

The memory of initial conditions disappear in about 12 hours

Assessment mode simulation

Example of boundary conditions influences on Friuli Venezia Giulia domain

Boundary conditions sensitivity experiment

- Eulerian chemical transport model (FARM ®Arianet) domain 160 km × 160 km resolution 4 km
- Regional scale emission inventory (INEMAR ARPA FVG) high space and time resolution
- Simulated boundary condition continental model (FARM ®Arianet)
- No initial conditions
- Air quality forecasts mode simulation
- Meteorological input WRF (http://www.wrf-model.org)
- Off line mode

Results

For small domains, boundary conditions are extremely relevant to achieve reliable particulate matter simulations

FARM is an Eulerian grid model for dispersion, transformation and deposition of reactive pollutants (photochemistry and aerosols) It is derived from **STEM** prof. G.R. Carmichael *et al.*, CGRER (Center for Global and Regional Environmental Research), University of Iowa, USA – Available under contract from ARIANET company - Italy

Air quality scenario for mitigation actions – traffic on all roads removed

PM10 mean field

FARM Output: date=20051001-20051031, tempo 000

PM10 mean field

FARM Output: date=20051001-20051031, tempo 000

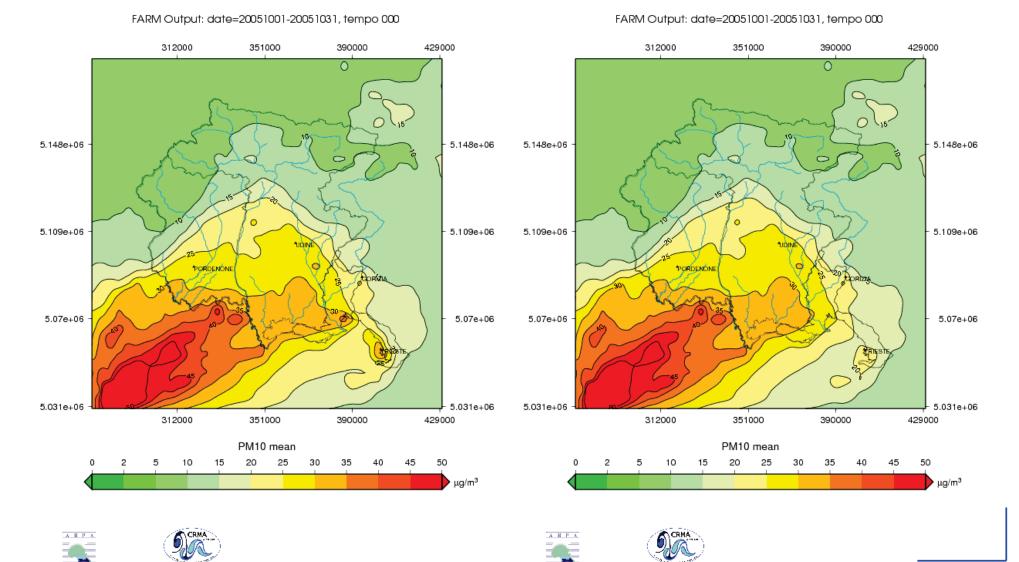

Air quality scenario for mitigation actions – without harbors emissions

PM10 mean field

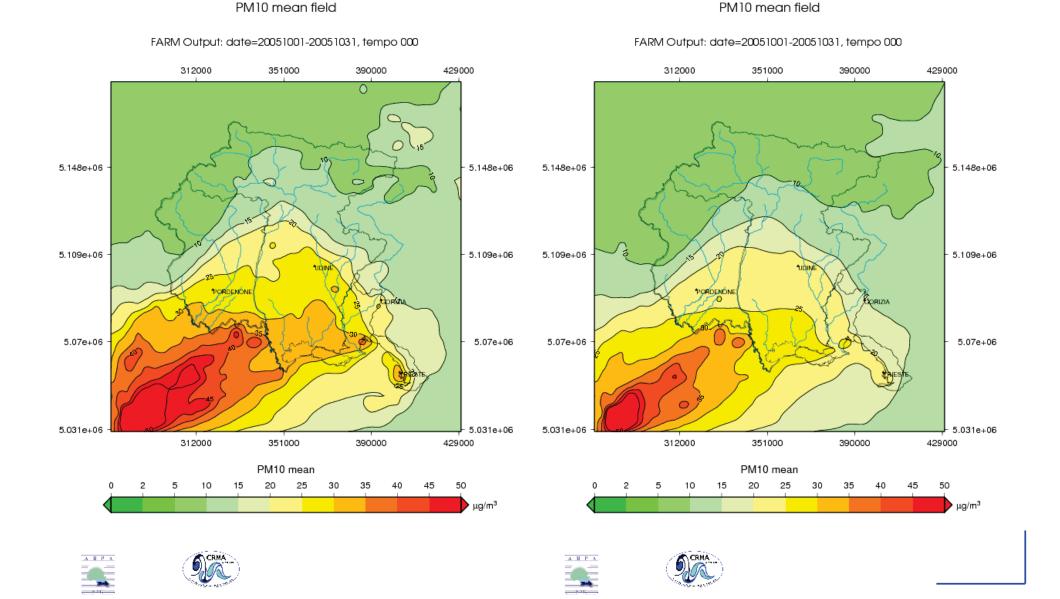

PM10 mean field

Air quality scenario for mitigation actions – primary particulate emissions removed

New computational approach – GRID computing

Heavy consuming simulations and complex work flows can be distributed on computational GRIDS

<u>Advantages</u>: larger computational resources, data storage and work flow facilities <u>Requirements</u>: e-infrastructure (user support and knowledge)

Example from project MADBAG: Monitoraggio Ambientale Distribuito BAsato su Grid

Grid computing is a form of distributed computing where a "virtual super computer" is built by many distributed computing and storage resources, integrated via a network middleware in order to optimize resource load and usage and provide higher throughput. GRIDCC and DORII add to Grid computing the capability to integrate distributed instruments and databases.

New computational approach – MADBAG project and GRID computing for AQ

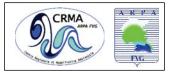

Project MADBAG: Monitoraggio Ambientale Distribuito BAsato su Grid

- Regional Project (Friuli Venezia Giulia)
- Partners: Sincrotrone Trieste (coordinator), ARPA-FVG, UNITS

Objectives:

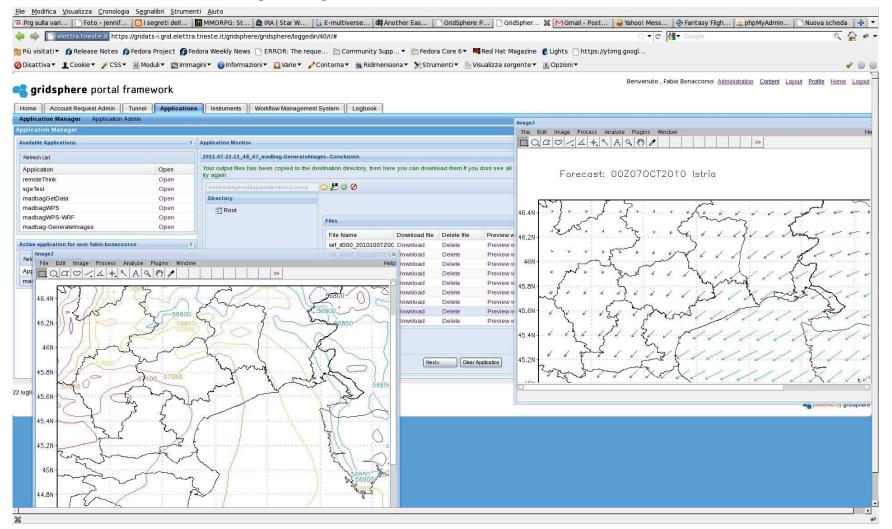

- Development of a distributed research infrastructure for environmental monitoring and capable of integrating meteo data, air quality data, databases of pollution sources and advanced computing resources.
- Provide the researchers with a powerful instrument to perform scenario analysis both on meteo and on air quality.

Air quality forecasts on GRID: the MADBAG project experience

A virtual control room allows to generate and monitor the complete simulation from the beginning to the end (based on web)

Thanks
