

Summer School on Climate Impacts  
Modelling for Developing Countries:  
Water, Agriculture and Health

(5 September 2011)

Session II: Weather data input for impact modelling

# Comparison of high-resolution satellite-based precipitation products over Africa

## Session II: Weather data input for impact modelling

Comparison of high resolution satellite-based precipitation products over Africa

### Outline

#### Introduction

- importance & truth
- objectives

#### Data

- SRFE
- measurements

#### Target area

#### Methods

- rainfall characteristics
- analysis:
  - point-to-pixel
  - average-point-to-pixel
  - large scale

#### Results

- error statistic
- quantile distribution
- monthly evaluation
- event-based evaluation
- spatial distribution

#### Summary

#### Recommendation

#### Discussion

## Precipitation = key steering factor of many socio-economic activities

- rainfed agriculture → nourishment
- floods → drowning
- droughts → starvation

### Aim

decrease socio-economic and human losses  
(facilitate planning of prevention, protection and mitigation measures)

### Approach

development / use of impact models, e.g.

- agricultural models
- flood or drought forecast models

### Dilemma

model performance relies on accuracy of precipitation information

**Which precipitation data should we use to feed our models?**

## Session II: Weather data input for impact modelling

Comparison of high resolution satellite-based precipitation products over Africa

### Precipitation information

**traditionally** rain gauge observations

- 😊 long historical records
- 😊 easy format
- 😞 insufficient network density
- 😞 point data
- 😞 missing values
- 😞 questionable reliability of records
- 😞 delay in reporting time
- 😞 limited accessibility of available data

➤ Many disadvantages! Is there an alternative?

**recently** satellite-based rainfall estimates (SRFE)

- 😊 quasi-global coverage
- 😊 high temporal and spatial resolution
- 😊 increasingly available
- 😊 accessible in near real-time
- 😞 complicated format

➤ Looks more promising. But **how reliable are they?**

#### Outline

##### Introduction

- importance & truth
- objectives

##### Data

- SRFE
- measurements

##### Target area

##### Methods

- rainfall characteristics
- analysis:
  - point-to-pixel
  - average-point-to-pixel
  - large scale

##### Results

- error statistic
- quantile distribution
- monthly evaluation
- event-based evaluation
- spatial distribution

##### Summary

##### Recommendation

##### Discussion

## Session II: Weather data input for impact modelling

Comparison of high resolution satellite-based precipitation products over Africa

### This presentation should give ...

- 1) an overview about available high resolution SRFE products
- 2) an indication about which product is the closest to ground observations
  - a) for certain areas (geographical location, climatologic conditions, topographic realities)
  - b) on a pan-African scale

### For whom is this PPP of interest?

- 1) People that need to select a precipitation data set for their application and don't know the strength and weaknesses of the individual SRFE products
- 2) People that use one of these SRFE products and would like to know more about them

#### Outline

##### Introduction

- importance & truth
- objectives

##### Data

- SRFE
- measurements

##### Target area

##### Methods

- rainfall characteristics
- analysis:
  - point-to-pixel
  - average-point-to-pixel
  - large scale

##### Results

- error statistic
- quantile distribution
- monthly evaluation
- event-based evaluation
- spatial distribution

##### Summary

##### Recommendation

##### Discussion

## Session II: Weather data input for impact modelling

Comparison of high resolution satellite-based precipitation products over Africa

### Which satellite-based rainfall estimates (SRFE) should be validated?

#### Outline

##### Introduction

- importance & truth
- objectives

##### Data

- SRFE
- measurements

##### Target area

##### Methods

- rainfall characteristics
- analysis:
  - point-to-pixel
  - average-point-to-pixel
  - large scale

##### Results

- error statistic
- quantile distribution
- monthly evaluation
- event-based evaluation
- spatial distribution

##### Summary

##### Recommendation

##### Discussion

#### Basic requirements:

- provided timely
- high temporal ( $\leq$  daily) and spatial ( $\leq 0.25^\circ$ ) resolution
- free of charge
- easily accessibility
- consistent (not many missing values)

| Product      | Provider              | Spatial coverage     | Temporal coverage | Spatial resolution | Temporal resolution |
|--------------|-----------------------|----------------------|-------------------|--------------------|---------------------|
| CMORPH       | NOAA-CPC              | 60°N-S, globally     | since 06.12.2002  | 0.25°              | 3 h                 |
| ERA-interim  | ECMWF                 | global               | 1989 - 2009       | ~ 79 km            | 6 h                 |
| GPROF v6     | NASA                  | globally             | Since 01.01.1998  | 0.25°              | 24 h                |
| GSMaP-MVK    | JAXA/EORC             | 60°N-S, globally     | 2003 - 2008       | 0.1°               | 1 h                 |
| PERSIANN     | University of Arizona | 60°N-S, globally     | Since 01.03.2000  | 0.25°              | 6 h                 |
| PERSIANN-CCS | University of Arizona | 50°N-S, globally     | Since 01.03.2000  | 0.04°              | 0.5 h               |
| RFE 2.0      | NOAA-CPC              | 40°N-S, 20° W - 55°E | Since 01.01.2001  | 0.1°               | 24 h                |
| TRMM 3B42 v6 | NASA                  | 50°N-S, globally     | Since 01.01.1998  | 0.25°              | 3 h                 |

## Session II: Weather data input for impact modelling

Comparison of high resolution satellite-based precipitation products over Africa

### Ground truth data

#### Outline

##### Introduction

- importance & truth
- objectives

##### Data

- SRFE
- measurements

##### Target area

##### Methods

- rainfall characteristics
- analysis:
  - point-to-pixel
  - average-point-to-pixel
  - large scale

##### Results

- error statistic
- quantile distribution
- monthly evaluation
- event-based evaluation
- spatial distribution

##### Summary

##### Recommendation

##### Discussion

### rain gauge observations

- 93 national stations (GTS stations excluded)
- daily records
- data from 2000 - 2005

### CRU TS 3.1

- interpolated monthly observations
- grid data (0.5°)
- released by British Atmospheric Data Centre
- publicly available: <http://www.cru.uea.ac.uk>

## Session II: Weather data input for impact modelling

Comparison of high resolution satellite-based precipitation products over Africa

### Over which areas should we validate?

#### Outline

##### Introduction

- importance & truth
- objectives

##### Data

- SRFE
- measurements

##### Target area

##### Methods

- rainfall characteristics
- analysis:
  - point-to-pixel
  - average-point-to-pixel
  - large scale

##### Results

- error statistic
- quantile distribution
- monthly evaluation
- event-based evaluation
- spatial distribution

##### Summary

##### Recommendation

##### Discussion

#### Focus:

- river-basin scale
- different climatologic regimes
- Different topographic realities

#### Limitations:

- accessibility of data
- amount, quality and distribution of available data

#### Zambezi

- tropical wet and dry
- one rain season
- 1200 mm/a (northern part)
- 38 stations

#### Volta

- mostly: tropical wet and dry
- one rain season (inland), two (at coastal zone)
- 300 (north), 1200 mm/a (south)
- 29 stations

#### Juba-Shabelle

- mostly: semi-arid to arid
- two rain seasons
- 500 mm/a
- 12 stations

#### Baro-Akobo

- highland climate
- one rain season
- 1800 mm/a
- 13 stations

## Session II: Weather data input for impact modelling

Comparison of high resolution satellite-based precipitation products over Africa

### What characteristics do we want to validate?

| Outline                                                                                                                                                                                                                      |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Introduction <ul style="list-style-type: none"> <li>importance &amp; truth</li> <li>objectives</li> </ul>                                                                                                                    |
| Data <ul style="list-style-type: none"> <li>SRFE</li> <li>measurements</li> </ul>                                                                                                                                            |
| Target area                                                                                                                                                                                                                  |
| Methods <ul style="list-style-type: none"> <li>rainfall characteristics</li> <li>analysis: <ul style="list-style-type: none"> <li>point-to-pixel</li> <li>average-point-to-pixel</li> <li>large scale</li> </ul> </li> </ul> |
| Results <ul style="list-style-type: none"> <li>error statistic</li> <li>quantile distribution</li> <li>monthly evaluation</li> <li>event-based evaluation</li> <li>spatial distribution</li> </ul>                           |
| Summary                                                                                                                                                                                                                      |
| Recommendation                                                                                                                                                                                                               |
| Discussion                                                                                                                                                                                                                   |

## Session II: Weather data input for impact modelling

Comparison of high resolution satellite-based precipitation products over Africa

### Outline

#### Introduction

- importance & truth
- objectives

#### Data

- SRFE
- measurements

#### Target area

#### Methods

- rainfall characteristics
- analysis:
  - point-to-pixel
  - average-point-to-pixel
  - large scale

#### Results

- error statistic
- quantile distribution
- monthly evaluation
- event-based evaluation
- spatial distribution

#### Summary

#### Recommendation

#### Discussion

### How do we want to validate them?

With a [point-to-pixel analysis](#)?

- If possible then not. Both have a different spatial representation, which would be derogatory to the skill of the satellite products

Solution: [average-points-to-pixel analysis](#)

- If 5 or more stations are within a  $2.5 \times 2.5^\circ$  cell, then the error of this average observation is negligible (less than 10 %) in comparison to the bias of the SRFE

Solution: [large-scale analysis with CRU](#)

## Session II: Weather data input for impact modelling

Comparison of high resolution satellite-based precipitation products over Africa

### Outline

#### Introduction

- importance & truth
- objectives

#### Data

- SRFE
- measurements

#### Target area

#### Methods

- rainfall characteristics
- analysis:
  - point-to-pixel
  - average-point-to-pixel
  - large scale

#### Results

- **error statistic**
- quantile distribution
- monthly evaluation
- event-based evaluation
- spatial distribution

#### Summary

#### Recommendation

#### Discussion

### Error statistic

- first impression:
  - for Zambezi and Volta RFE 2.0 and TRMM 3B42 are the best
  - for JS and BA CMORPH is the best

best score  
 2nd best score

|       |             | Zambezi |       |       |       |       | Volta |       |       |       |       | Juba-Shabelle |       | Baro-Akobo |       |
|-------|-------------|---------|-------|-------|-------|-------|-------|-------|-------|-------|-------|---------------|-------|------------|-------|
|       |             | Z-1     | Z-3   | Z-4   | Z-5   | Z-7   | V-1   | V-2   | V-3   | V-4   | V-6   | JS-1          | JS-3  | BA-1       | BA-2  |
| MAE   | ERA-interim | 2.8     | 3.0   | 2.2   | 2.5   | 2.2   | 2.2   | 1.8   | 2.8   | 3.4   | 4.1   | 1.2           | 20.1  | 4.3        | 4.5   |

## Session II: Weather data input for impact modelling

Comparison of high resolution satellite-based precipitation products over Africa

### Quantile distribution

- (1) a good agreement of the amount of low precipitation ( $< 15$  mm) values
- (2) increased amount of high precipitation values for GPROF and GSMaP-MVK
- (3) increased amount of lower small precipitation values while shifting towards underestimation of observed precipitation for high values for ERA-interim

#### Outline

##### Introduction

- importance & truth
- objectives

##### Data

- SRFE
- measurements

##### Target area

##### Methods

- rainfall characteristics
- analysis:
  - point-to-pixel
  - average-point-to-pixel
  - large scale

##### Results

- error statistic
- [quantile distribution](#)
- monthly evaluation
- event-based evaluation
- spatial distribution

##### Summary

##### Recommendation

##### Discussion

## Session II: Weather data input for impact modelling

Comparison of high resolution satellite-based precipitation products over Africa

### Outline

#### Introduction

- importance & truth
- objectives

#### Data

- SRFE
- measurements

#### Target area

#### Methods

- rainfall characteristics
- analysis:
  - point-to-pixel
  - average-point-to-pixel
  - large scale

#### Results

- error statistic
- quantile distribution
- [monthly evaluation](#)
- event-based evaluation
- spatial distribution

#### Summary

#### Recommendation

#### Discussion

### monthly box-plots

#### Zambezi

- large spread between the quartiles → high monthly variability
- median low → most month hold low precipitation
- positive skewness for CMORPH, PERSIANN and GPROF

#### Volta

- median confirms increase of precipitation from north to south
- TRMM 3B42 and PFE capture the spread well

#### Juba-Shabelle

- negligible differences between the SRFE
- narrow spread reflect arid conditions
- SRFE have skill in reproducing precipitation for this area on a monthly scale

#### Baro-Akobo

- large difference between north and south
- product-wise CMORPH seems to be most accurate

## Session II: Weather data input for impact modelling

Comparison of high resolution satellite-based precipitation products over Africa

### Average inter-annual variation

#### Outline

#### Introduction

- importance & truth
- objectives

#### Data

- SRFE
- measurements

#### Target area

#### Methods

- rainfall characteristics
- analysis:
  - point-to-pixel
  - average-point-to-pixel
  - large scale

#### Results

- error statistic
- quantile distribution
- monthly evaluation
- event-based evaluation
- spatial distribution

#### Summary

#### Recommendation

#### Discussion

- (1) better accuracy during the relative dry periods, large deviations during the wet months
- (2) PERSIANN, CMORPH, GSMaP-MVK and GPROF stick out with large, mostly positive, deviations
- (3) TRMM 3B42 and RFE 2.0 show the highest accuracy

## Session II: Weather data input for impact modelling

Comparison of high resolution satellite-based precipitation products over Africa

### highest annual rainfall events

good temporal fit of the peak precipitation

SRFE show no peak  
(less than 10 mm / event)

overestimation of  
rainy days per year

underestimation of  
rainy days per year

inability to reproduce the  
rainfall event quantitatively

#### Outline

##### Introduction

- importance & truth
- objectives

##### Data

- SRFE
- measurements

##### Target area

##### Methods

- rainfall characteristics
- analysis:
  - point-to-pixel
  - average-point-to-pixel
  - large scale

##### Results

- error statistic
- quantile distribution
- monthly evaluation
- **event-based evaluation**
- spatial distribution

##### Summary

##### Recommendation

##### Discussion

## Session II: Weather data input for impact modelling

Comparison of high resolution satellite-based precipitation products over Africa

### Spatial distribution

#### Outline

##### Introduction

- importance & truth
- objectives

##### Data

- SRFE
- measurements

##### Target area

##### Methods

- rainfall characteristics
- analysis:
  - point-to-pixel
  - average-point-to-pixel
  - large scale

##### Results

- error statistic
- quantile distribution
- monthly evaluation
- event-based evaluation
- [spatial distribution](#)

##### Summary

##### Recommendation

##### Discussion

- CRU data serves as reference (gridded observation)
- significant overestimation over the tropics (PERSIANN(-CCS), CMORPH, ERA-interim)
- RFE 2.0 and TRMM 3B42 are very close to the observation
- same tendencies for maximum monthly values

## Session II: Weather data input for impact modelling

Comparison of high resolution satellite-based precipitation products over Africa

### Outline

#### Introduction

- importance & truth
- objectives

#### Data

- SRFE
- measurements

#### Target area

#### Methods

- rainfall characteristics
- analysis:
  - point-to-pixel
  - average-point-to-pixel
  - large scale

#### Results

- error statistic
- quantile distribution
- monthly evaluation
- event-based evaluation
- spatial distribution

#### Summary

#### Recommendation

#### Discussion

### All products / in general

- 😊 very good reproduction of dry periods
- 😊 good reproduction of spatial pattern across the continent
- 😞 underestimate amount of heavy rainfall events
- 😞 largest deviations within the wet periods

### Product-wise

- 😞 • GPROF & GSMaP-MKV → daily rainfall variability wrongly reproduced: most days rain-free; low amount of rainy days hold extreme values
- ⋮
- PERSIANN(-CCS) → large overestimations (annual; over the tropical band)
- ⋮
- 😐 • ERA-interim → daily rainfall variability too flat (most days are rainy days, but the amount of rainfall is low: around 6-10 mm)
- ⋮
- CMORPH → captures rainfall over mountainous areas well; overestimation in low altitudes
- ⋮
- 😊 • RFE 2.0 & TRMM 3B42 → closest to observed (inter-annual variability, spatial distribution pattern, timing of heavy rainfall events)

## Session II: Weather data input for impact modelling

Comparison of high resolution satellite-based precipitation products over Africa

### Which data set to chose...

#### ... for certain areas?

- Mountainous regions:
  - CMORPH,
  - GPROF (for monthly applications)
- Arid to semiarid zone:
  - CMORPH,
  - RFE 2.0
- Tropical wet and dry:
  - RFE 2.0,
  - TRMM 3B42
- (Tropical wet:
  - RFE 2.0,
  - TRMM 3B42)

#### ... on a pan-African scale?

- RFE 2.0, TRMM 3B42

#### Outline

##### Introduction

- importance & truth
- objectives

##### Data

- SRFE
- measurements

##### Target area

##### Methods

- rainfall characteristics
- analysis:
  - point-to-pixel
  - average-point-to-pixel
  - large scale

##### Results

- error statistic
- quantile distribution
- monthly evaluation
- event-based evaluation
- spatial distribution

##### Summary

##### Recommendation

##### Discussion

## Session II: Weather data input for impact modelling

Comparison of high resolution satellite-based precipitation products over Africa

# Thank you for your attention!

### Outline
