

Summer School on Climate Impacts
Modelling for Developing Countries:
Water, Agriculture and Health

(9 September 2011)

Session IV: Water

Towards a pan-African flood alert system?

Vera Thiemig
*Land Management and Natural Hazards Unit
Institute for Environment and Sustainability*

Session IV: Water

Towards a pan-African flood alert system

Why a flood forecasting system for Africa?

Floods in Northern Hemisphere Africa 2007

- ~ 650,000 homes destroyed
- 1.5 million people affected
- 200 people drowned
- substantial economic losses

| Outline | |

| Discussion | |

Flood risk is likely to increase due to climate change and urban growth!

Benefits of a flood forecasting system:

- gain in response time
- **better planning and organizing** of prevention, protection and mitigation measures
- **aid for national authorities** and international organisations (World Food Programme & European Commission MIC)

Session IV: Water

Towards a pan-African flood alert system

How and by whom are floods in Africa managed today?

- sources: scientific literature + institutional websites + questionnaire
- questionnaire:
 - http://efas-is.jrc.ec.europa.eu/africa_questionnaire_en.php
 - content: area of activity, forecasting techniques, input data, lead-time, usage, collaboration / links, needs, etc.
 - ~ 500 were distributed to institutions that were suspected to deal with flood management in Africa (2/3 within Africa, 1/3 outside of Africa)
 - 65 questionnaires from **53 institutions** returned (49 African institutions)

Discussion

Session IV: Water

Towards a pan-African flood alert system

Main findings:

1. There are **many** institutional **flood forecasting initiatives ongoing** in Africa, but information are not easily accessible
2. There are **needs** for:

- a (complementary) flood forecasting and early warning system for medium-ranged forecasts
- technical expertise
- increased funds

Strength of the European Flood Alert System (EFAS)!

3. **Dissemination** of existing flood forecasts and **warnings** to end-users and the public could be **improved**

Session IV: Water

Towards a pan-African flood alert system

This presentation should give ...

- 1) an overview about the current status of flood forecasting in Africa
- 2) a rough idea about the European Flood Alert System (EFAS)
- 3) an example of an African application

Outline

Discussion

For whom is this PPP of interest?

People that are interested in flood forecasting or hydrological modelling

Session IV: Water

Towards a pan-African flood alert system

European Flood Alert System (EFAS)

- Land Management and Natural Hazard Unit, Joint Research Centre, EC
- developed since 2003; **pre-operational** since 2005
- currently 34 partner institutions (MoU)
- **probabilistic flood alert system**, for **large-scale river basins**, with **extended lead time** up to 10 days (lead times of most national systems: 2-3 days)
- **complementary system** to the already existing national ones

Outline

Introduction

Discussion

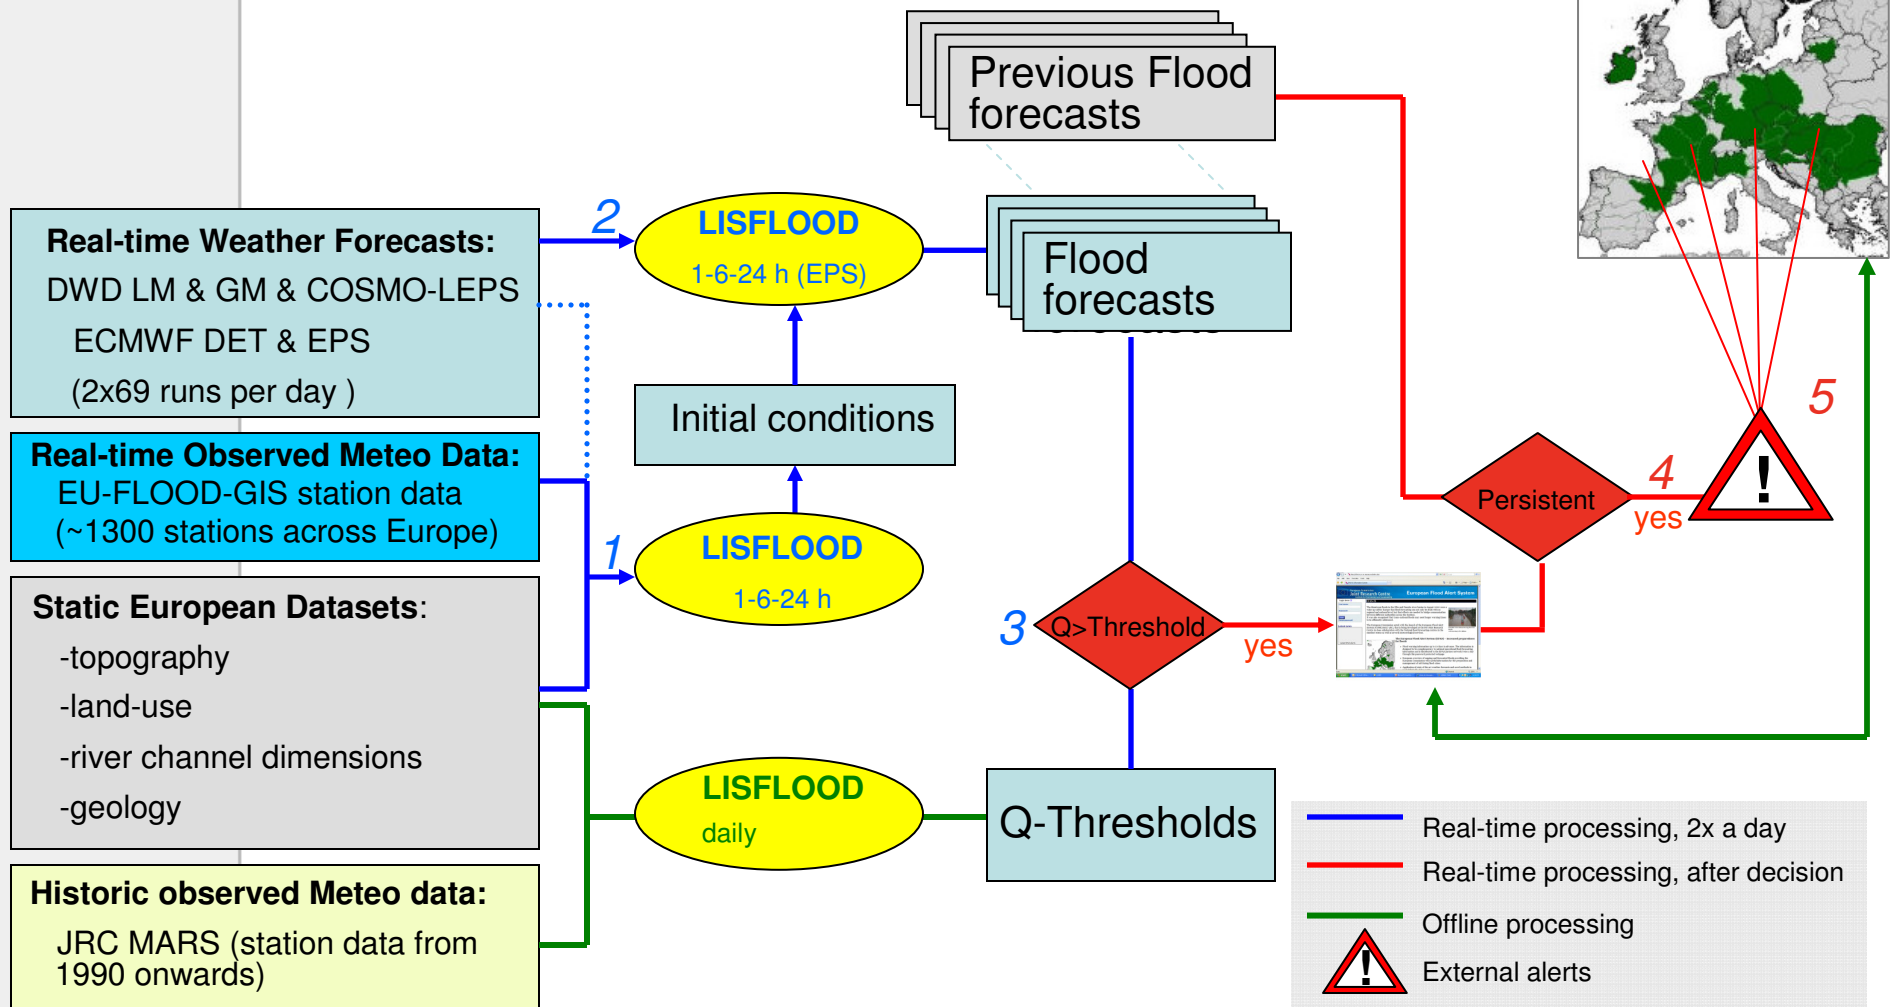

Session IV: Water

Towards a pan-African flood alert system

How does the European Flood Alert System (EFAS) work?

Session IV: Water

Towards a pan-African flood alert system

Does EFAS have an potential for African basins?

- (1) probabilistic flood warning system for **large-scale** river basins
- (2) can cope with a **limited** amount of input **data**
- (3) **increases** the **lead times** to up to 15 days
- (4) clear, concise and unambiguous visualization and decision support **products**
- (5) expert **knowledge** + commitment of **partners / contacts**

| Discussion |

- Ghana, Burkina Faso, Togo
- 394,000 km²
- altitude ranges from 600 m to sea level
- **climate:**
 - north: dry (Sahelian influenced), 300 – 500 mm, short uni-modal rainfall pattern
 - south: wet (oceanic influenced), 1200-1500 mm; long, slightly bi-modal pattern

Session IV: Water

Towards a pan-African flood alert system

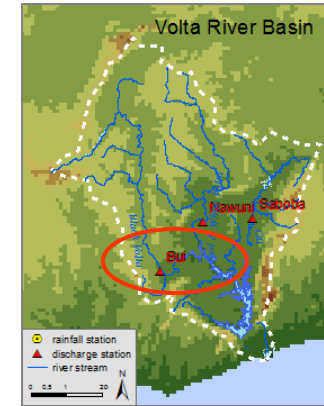

Which data are used?

Meteorological data

- CMORPH (2003-2010)
- ERA-interim (1989-2009)
- GSMaP-MKV (2003-2009)
- GPROF (1998-2010)
- PERSIANN (2000-2010)
- PERSIANN-CCS (2006-2010)
- RFE 2.0 (2001-2010)
- TRMM-TMP 3B42 (1998-2010)
- EPS (Events: 1999, 2003, 2007, 2008)

near-real-time SRF for calibration and validation

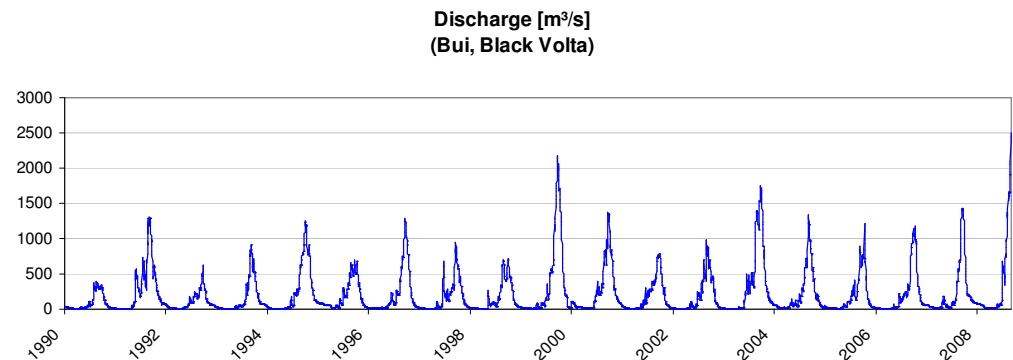

meteorological forecasts for hydrological hindcasting

Hydrological data

- Bui (Black Volta)
- Nawuni (Red & White Volta)
- Saboba (Oti)

Many static data

(such as land cover, soil information, ...)

Outline

Introduction

Discussion

Session IV: Water

Towards a pan-African flood alert system

How was the study executed?

- (1) **uncalibrated test run**
→ first impression on model behaviour for this catchment
- (2) **simple sensitivity analysis**
→ identify sensitive parameters for model calibration
- (3) **automatic calibration** (2004 – 2007)
→ adjustment of the model
 - Shuffle Complex Evolution algorithm (SCE-UA)
 - Shape (r) & quantity (NSEff)
 - visual and statistical comparison (correlation, CRPS, spread-skill relationship, rank histogram, ROC)
- (4) **validation** (2002-2003)
→ verify the performance of the model after calibration
- (5) **thresholds**
→ derive warning levels (for low, medium, high and severe flood)
- (6) **hindcasting**
→ test how good the system would predict floods

Outline

2. calibrated →

3. validated →

| Goodness of fit parameters | RFE | | |
|----------------------------|--------------|------------|-----------|
| | uncalibrated | calibrated | validated |
| RMSE [-] | 227 | 86 | 216 |
| Nash-Sutcliff [-] | 0.63 | 0.92 | 0.7 |
| correlation [-] | 0.76 | 0.96 | 0.9 |

Session IV: Water

Towards a pan-African flood alert system

How to derive thresholds?

| EFAS threshold | Colour | Hazard description |
|-------------------|--|---|
| S (severe) | ■ | Very high probability of flooding, potentially severe flooding expected |
| H (high) | ■ | High possibility of flooding, bankfull conditions or higher expected. |
| M (medium) | ■ | Water levels high but no flooding expected. |
| L (low) | ■ | Water levels higher than normal but no flooding expected. |

translated into return periods:

severe = 20
high = 5
medium = 2
low = 1

Discussion

Bui, Black Volta (long-term simulation using RFE 2.0)

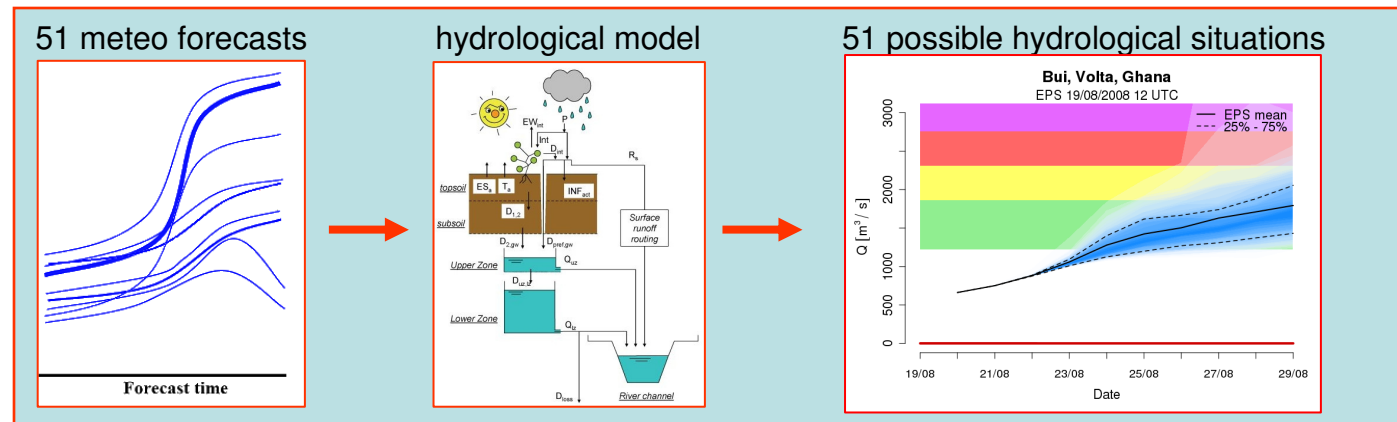

Session IV: Water

Towards a pan-African flood alert system

Why are we calculating hindcasts?

- **hindcasting = retrospective analysis** of the hydrological situation
- to determine the **potentials of the hydrological model** to produce flood forecasts
- **procedure:**

→ EFAS-methodology has potential to process flood forecasts for African basins

Session IV: Water

Towards a pan-African flood alert system

1. Questionnaire has revealed that there are a **significant number of flood forecasting initiatives ongoing in Africa**, but information are not easily accessible.

2. **EFAS-methodologies** have shown a **potential to process medium-ranged flood forecasts for African basins** with a high accuracy in terms of timing and magnitude

in Juba-Shabelle:

- flood events have been detected successfully in more than 85 % of all cases
- Average lead-time: 6-8 days (for floods exceeding the high alert threshold)

in Volta:

- even the quantity is well predicted

3. **The JRC is working towards a Pan-African Flood Alert System**

- more case studies are planned in different river basins
- hydrological model is being adjusted
