Introduction to optical fabrication. II

Oscar E. Martínez

Introduction

- Optical lithography: Ways to break the diffraction barrier
 - $\downarrow \lambda$ (projection, interferencial, ablation)
 - Non linear (multiphoton, near field)
- SPAG – Surface Percolation and Growth
- Protein patterning
- Nano Printing Nano Particles

OUR SCHEME

- SURFACE PERCOLATION AND GROWTH
 - ONLY ONE LASER
 - ONLY ONE PHOTON

Experimental setup

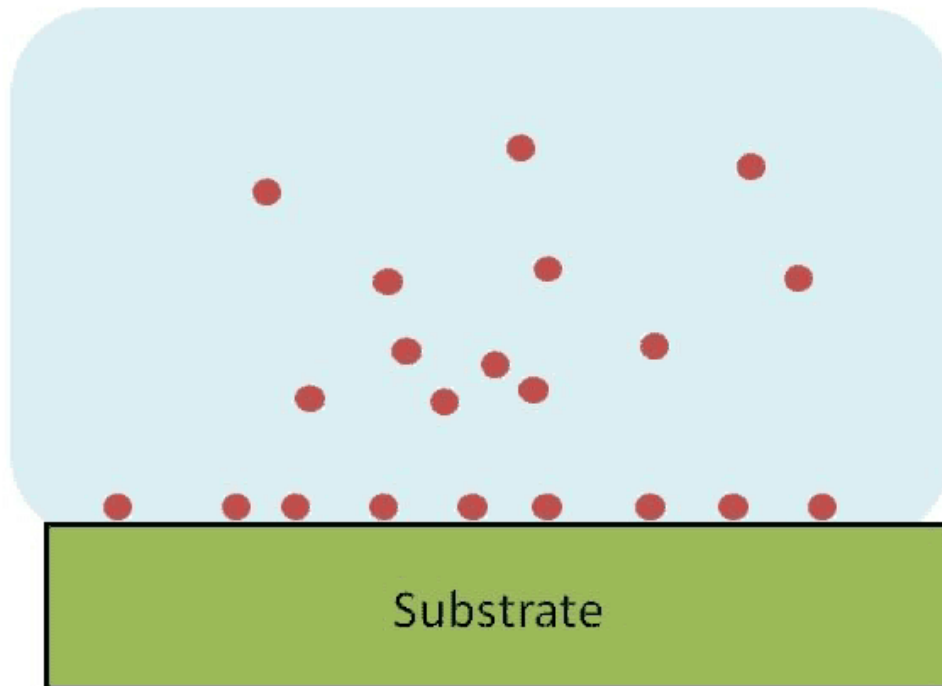

- Parameters

- dye
- wavelength
- Dye concentration
- Laser power
- Exposure time

Polymerization

- Inicial preparation

● Dye molecule

Adhesive + Dye

- Adhesive

- Photocurable with UV
- Refractive index $n=1.54$
- Non toxic
- Solvent resistant
- Loz cost \$24/oz

- Dye

- Interacts with the adhesive to start polymerization
- Tested dyes
 - **ADS675MT**
 - ADS740MP
 - ADS760MP
 - ADS775PI
 - **NileBlue perchlorate**
 - LDS821
 - HITC

Polymerization

- Initial stage

Polimerización

- Surface percolation

Polimerización

- Adsorption of new molecules

Polimerización

- Growth

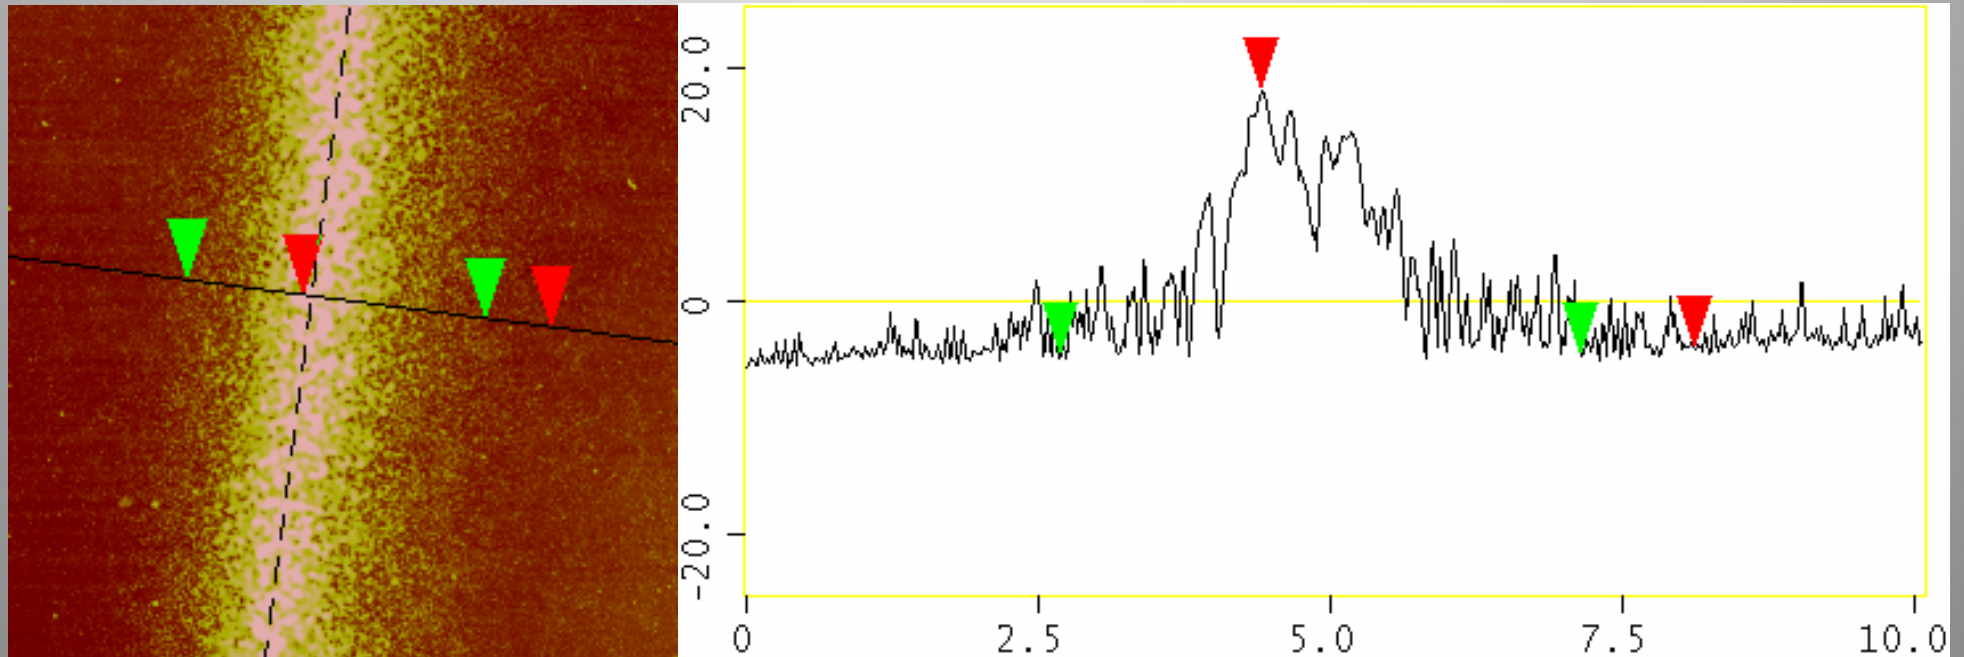

Polimerización

- Volume percolation

Results

- Surface Percolation

$$dh/dt = v \Phi_p \sigma I(t) \rho$$

Results

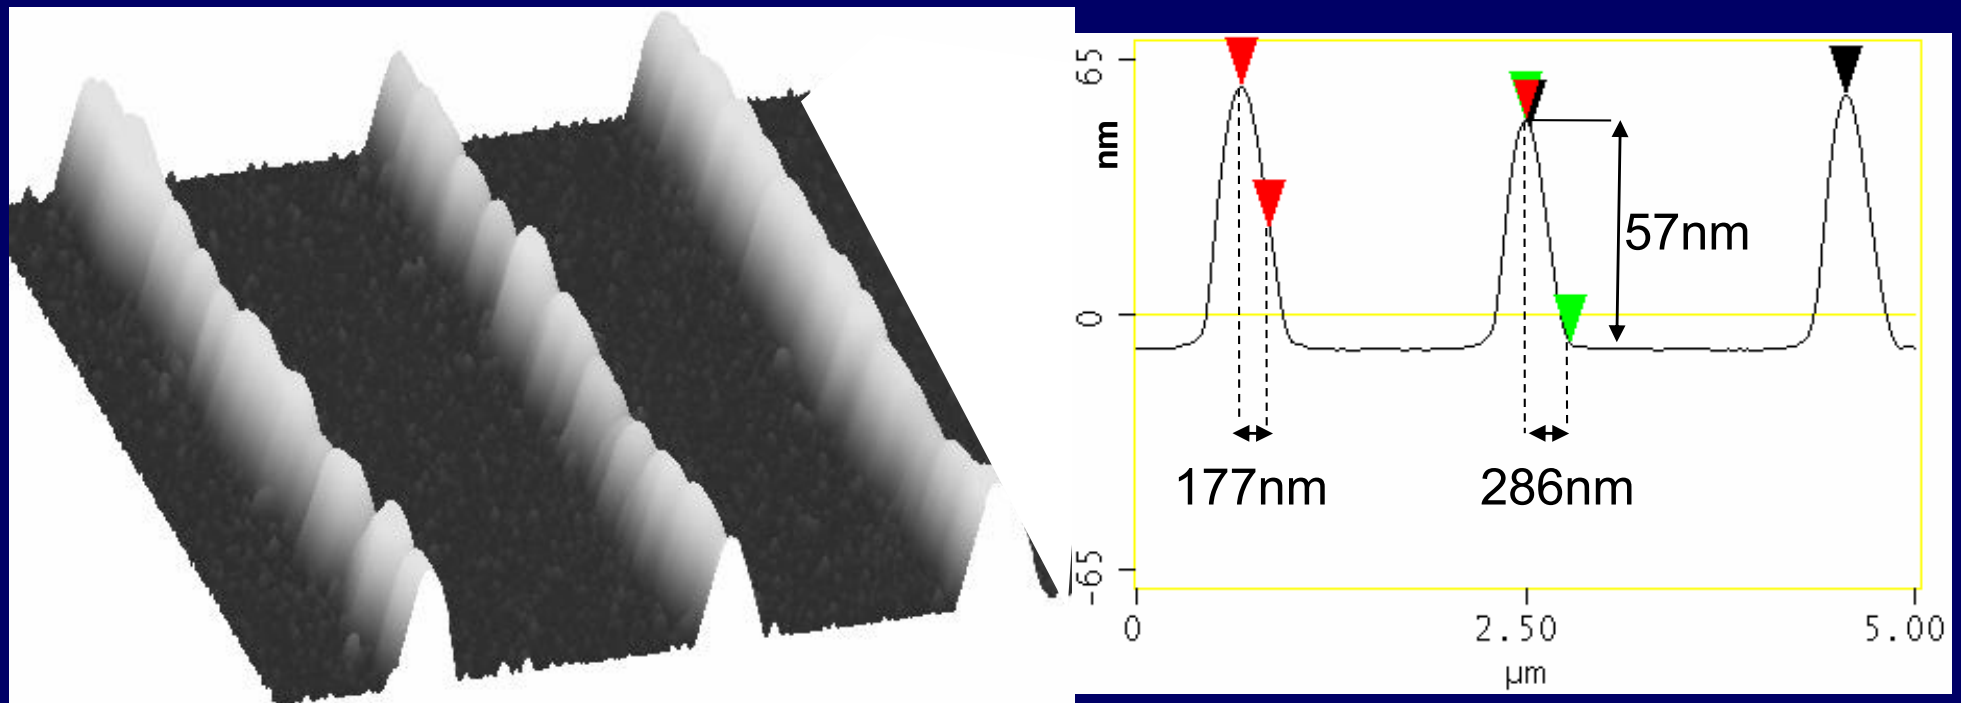

- Lines with NileBlue-NOA63 1mM

NA=0.9

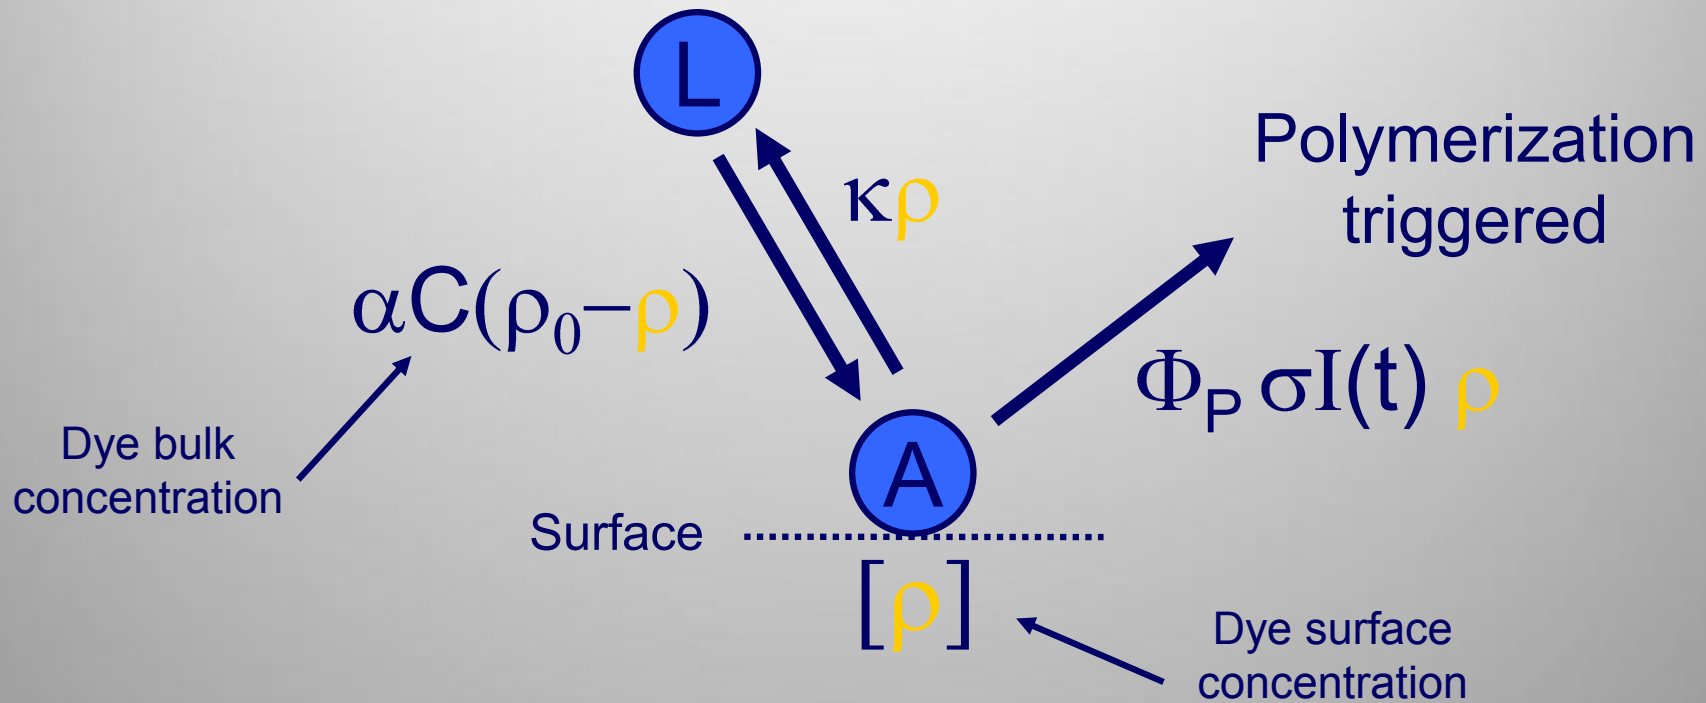

t=0.05s

P=550 μ W

F \sim 7,7 10^{22} phot cm $^{-2}$

Process Dynamics

$$\begin{cases} d\rho/dt = \alpha C(\rho_0 - \rho) - \kappa \rho - \Phi_P \sigma I(t) \rho \\ dh/dt = v \Phi_P \sigma I(t) \rho \end{cases}$$

$C = 50\mu\text{M}$

$$\Phi_P = \frac{1}{\sigma I \tau} \approx (7 \pm 2) 10^{-7}$$

C = 100 μ M

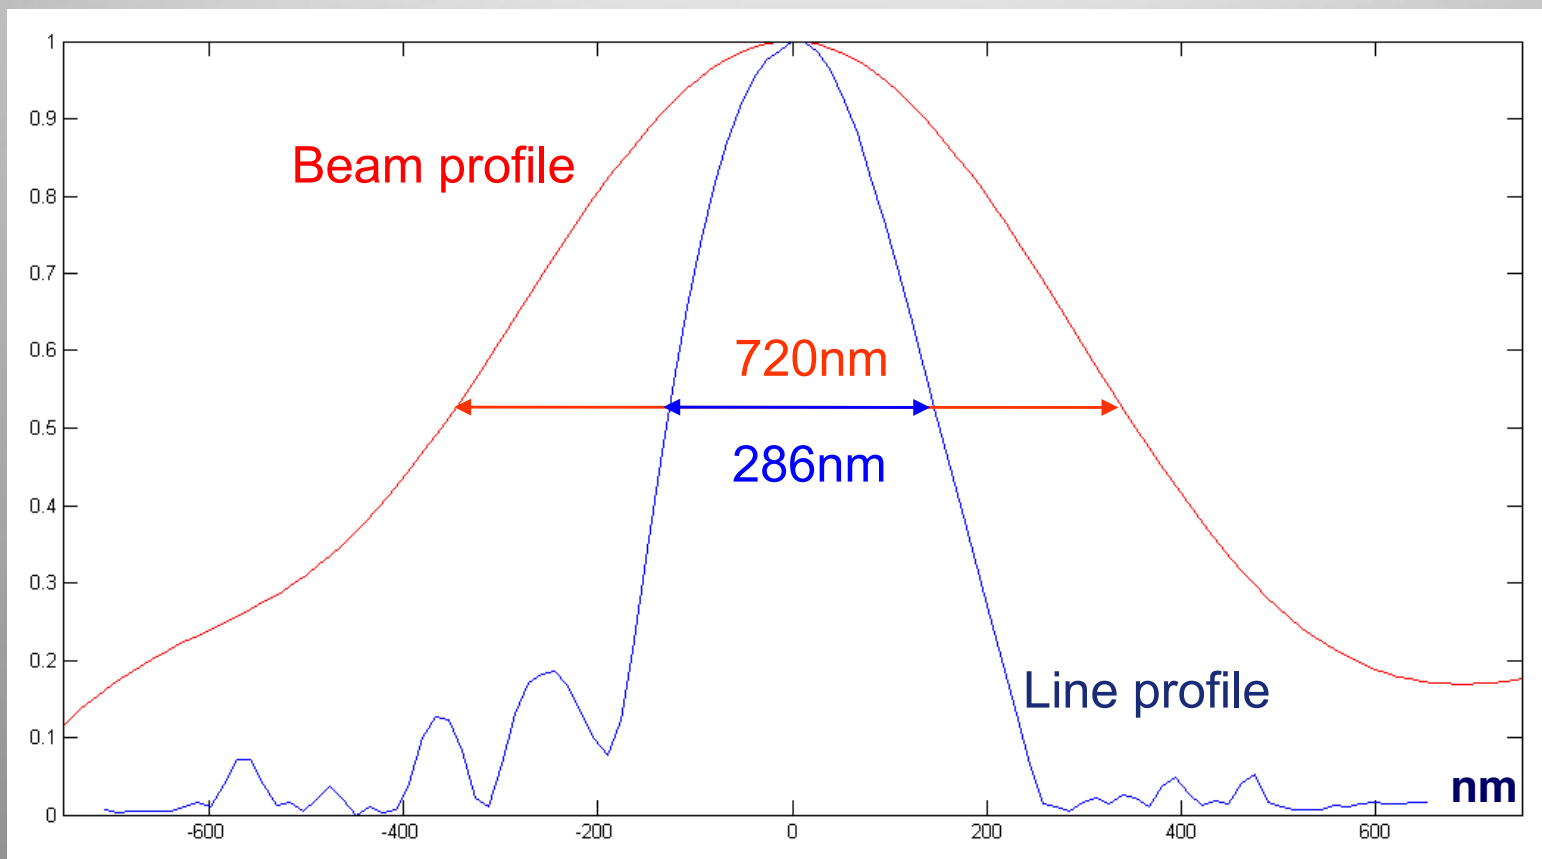

$$h(t) = m(t - t_0) + h_0 - m\tau \left(1 - e^{-\frac{t-t_0}{\tau}} \right)$$

Results

$$720\text{nm}/285\text{nm} = 2.5$$

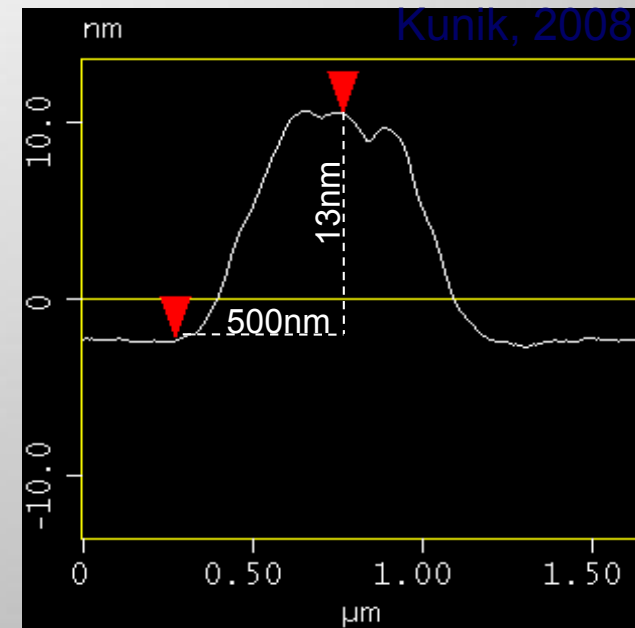

- Line profile vs Pump beam profile

The lateral diffraction barrier can be broken

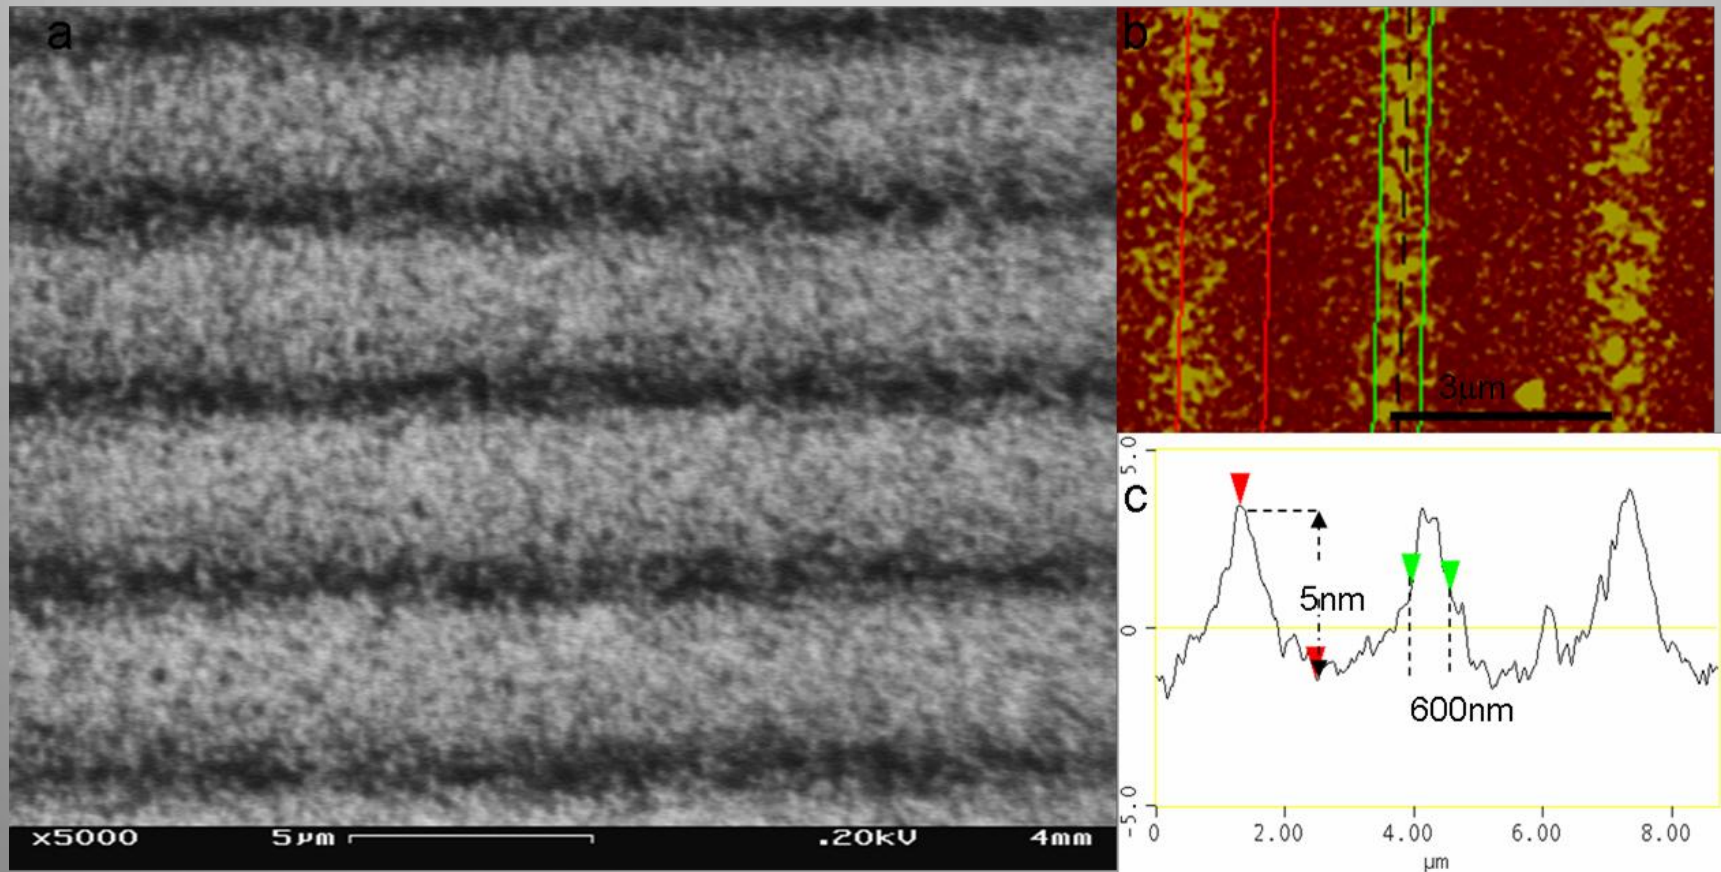

Applications

- Fluorescent structures with $h < 15\text{nm}$

Applications

- Growth on gold substrate (Au ~ 30nm)

Applications

- Neuron growth on fluorescent grid

Costantino et al, 2005

- Grid made on a commercial confocal microscope

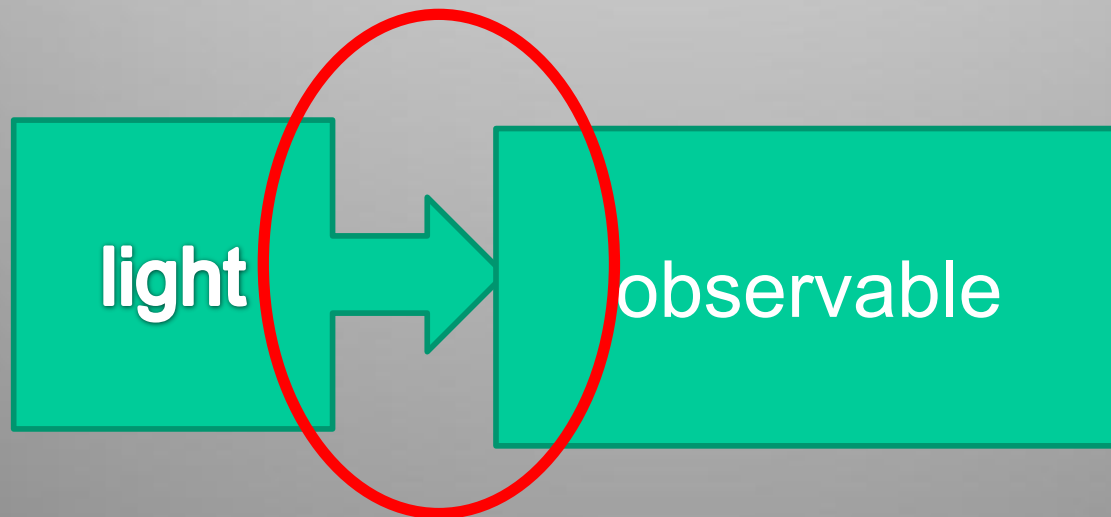

Kunik, 2008

Applications

- And also...

Diffraction limit

Diffraction limit

Diffraction limit

profile	h	b	w
1	24.1	109	154
2	23.1	105	148

Conclusions

SPAG places the nonlinearity at the growth mechanism, not the light-matter interaction.

Diffraction (linear response) is no longer a limit.

10nm axial resolution in growth

2.5 times smaller than beam size in lateral dimensions.

Laser Assisted Protein Adsorption by Photobleaching

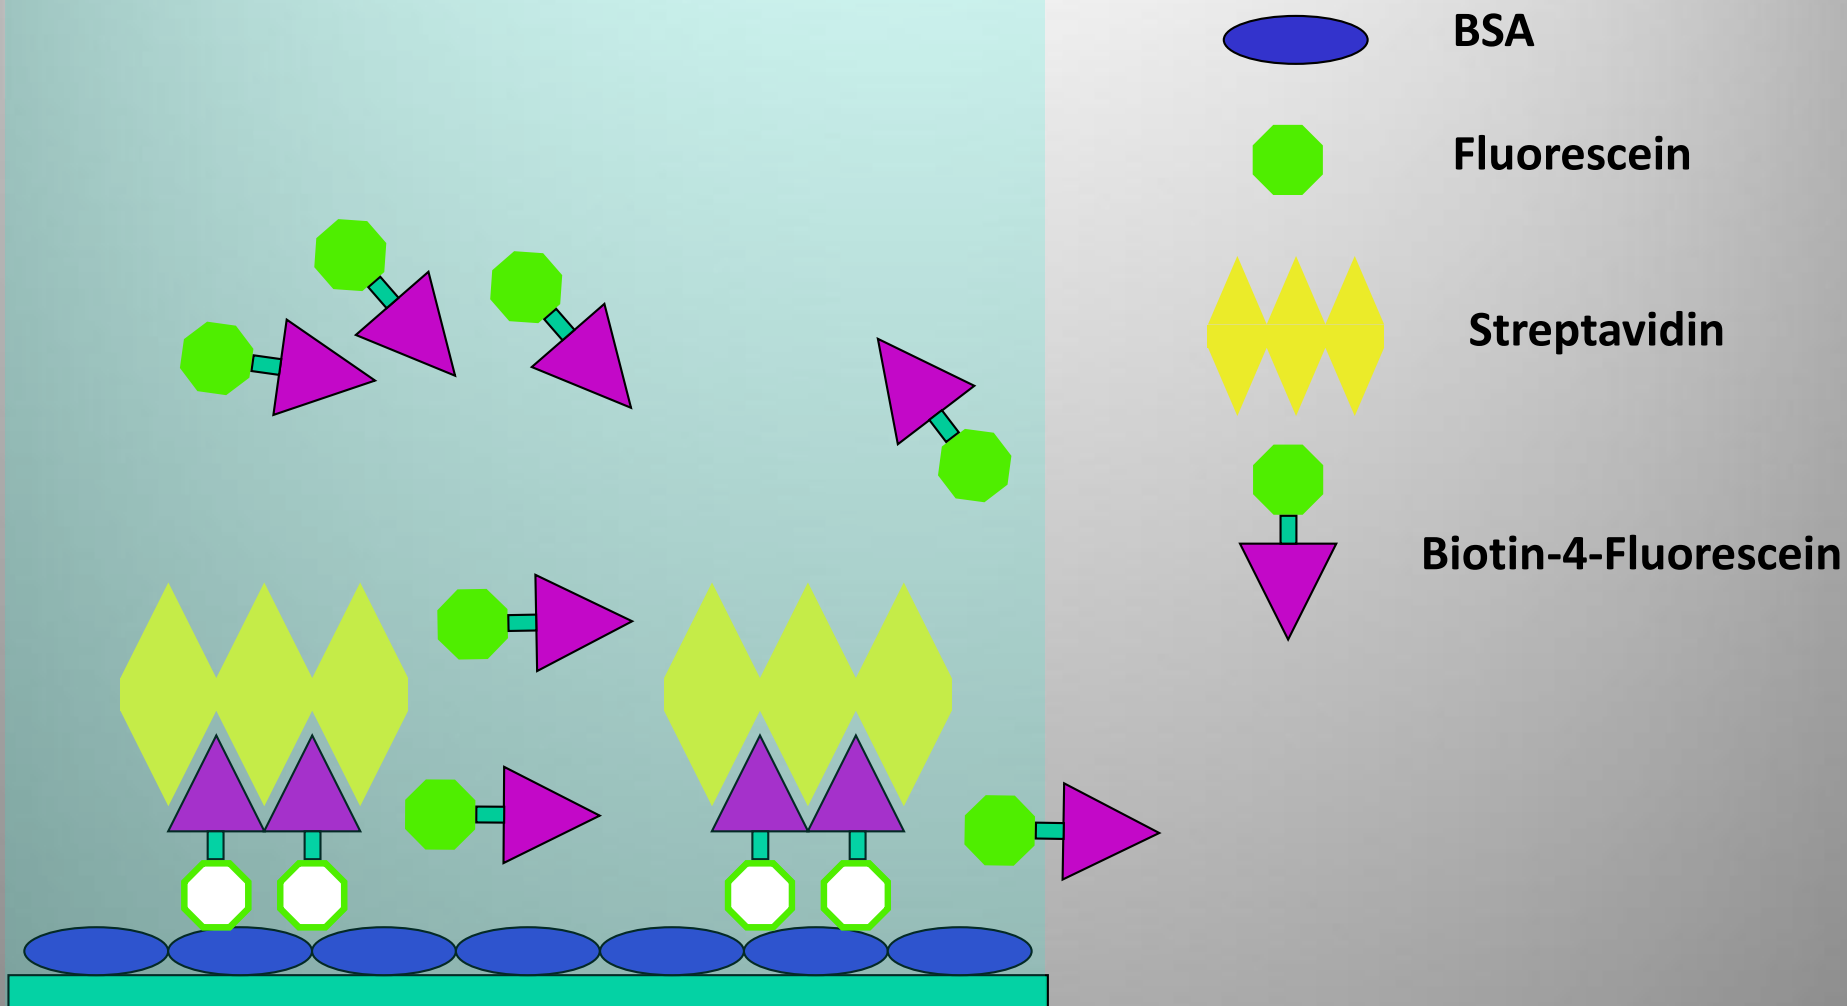

Gradient

Any Shape

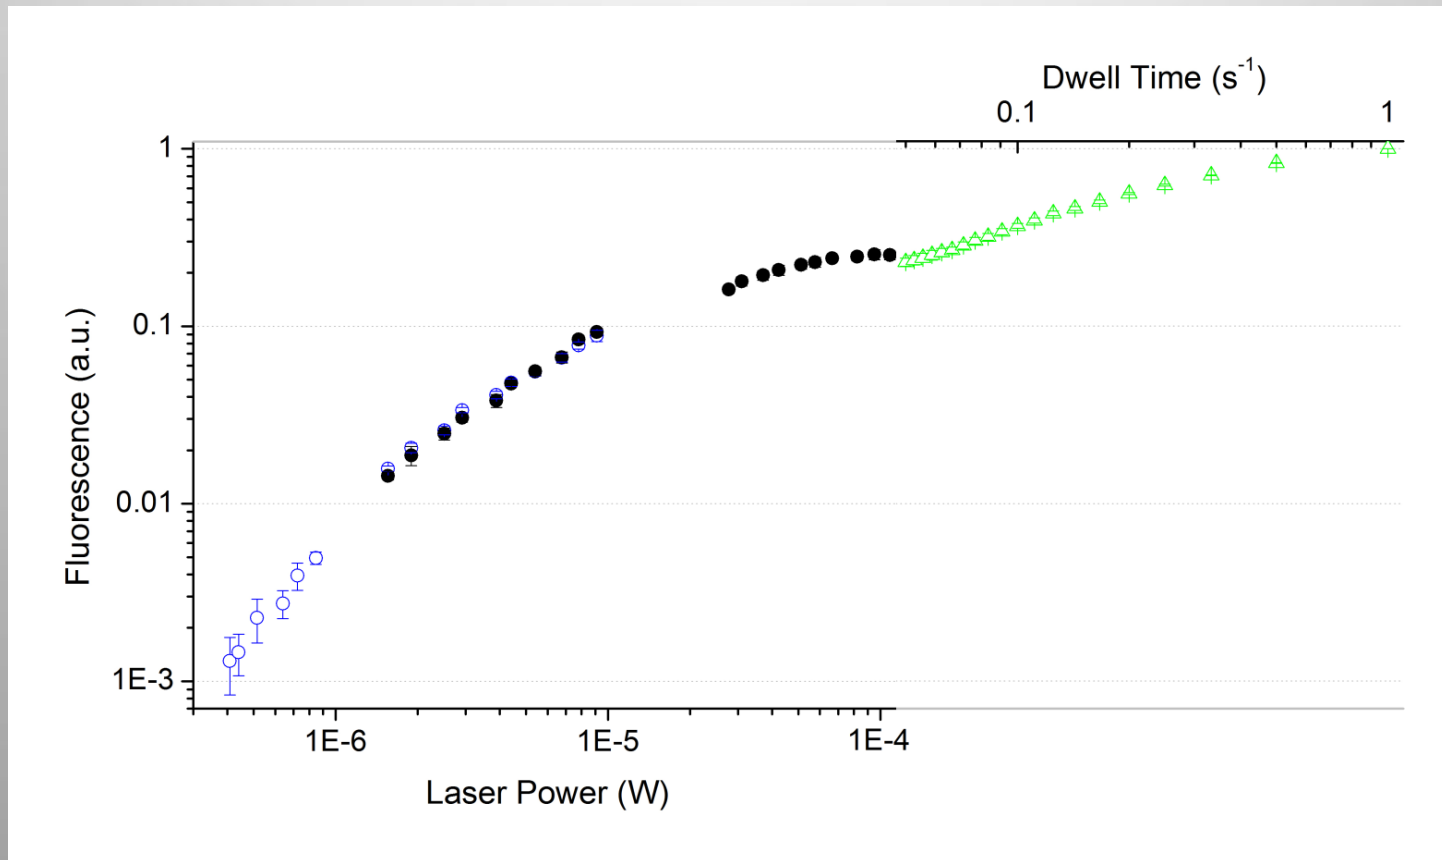

Laser Assisted Protein Adsorption by Photobleaching

Characterisation of LAPAP

Dwell Time and Laser Power

20 μm

Functionality

Biotinylated antibody and its antigen

Biotinylated peptide

Functionality

- 1) 400 gradients : 200 IKVAV peptide and 200 control (biotin-4-fluorescein)
- 2) Cultured DRG on these gradient for 24 to 36 hours
- 3) Imaged all the gradients
- 4) Images randomly numbered and analyzed by a blind observer

25 μ m

Functionality

Example of guided axon

SRARKQAAS**IKVAV**SARD

Two lasers

671nm

473nm

1. FITC goat
2. Rabbit anti
3. FITC goat

1. Cy5 goat anti-mouse
- Mouse anti-myc(9E10)
3. Cy5 goat anti-mouse

5μm

Subsequent illumination

1. FITC goat anti-mouse
2. Mouse anti-myc(9E10)
3. TRITC goat anti-mouse

1. FITC goat anti-rat
2. Rat anti-ter119
3. FITC goat anti-rat

1. FITC goat anti-rabbit
2. Rabbit anti-laminin
3. Cy5 goat anti-rabbit

Colloidal interactions

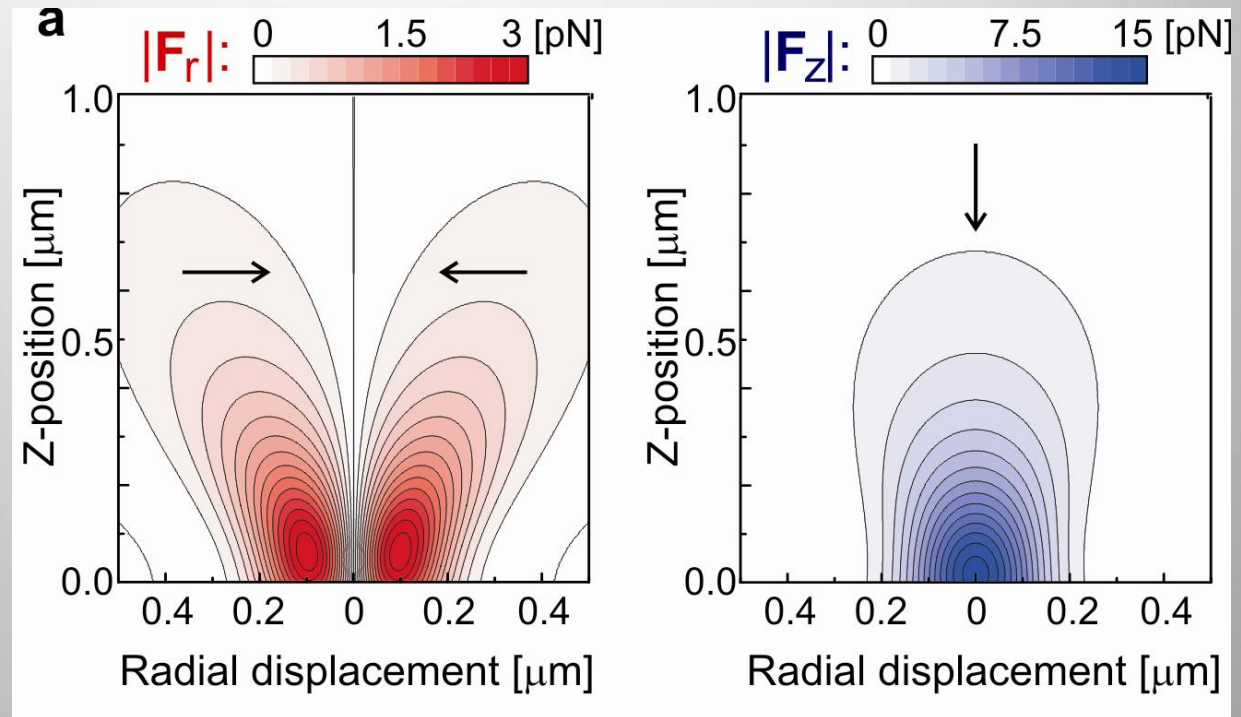

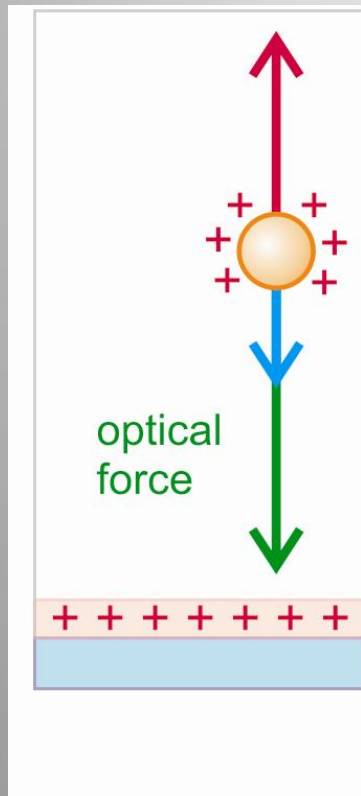

Laser printing single nanoparticles

Laser printing single nanoparticles

Printing accuracy

Printing accuracy:

- Beam size and intensity
- Brownian motion

Printing individual gold nanoparticles (Au NPs) using optical forces. (a) Calculated radial (left) and axial (right) optical forces acting on an Au NP with a diameter of 80 nm as a function of the position in a Gaussian focused beam (532 nm, 10 mW).

Printing accuracy

There is no fundamental limit!

- Increase solution viscosity
- Tighter focusing
- Microinjection

In addition:

- Orientation control by polarization
