random Microseed Matrix-Screening

D'Arcy et al. Acta Cryst. (2007). D63. 'An automated microseed matrix-screening method for protein crystallization'

1. Add seed crystals to a random screen

2. Suspend crushed crystals in the reservoir solution that gave the hits used ("hit solution")

3. Automate!

To get:

(1) more hits

(2) better crystals

(3) the right number of crystals (e.g. for soaking)

Douglas Instruments

random Microseed Matrix-Screening (rMMS)

Douglas Instruments

“rMMS”
D’Arcy et al. Acta Cryst. (2007). D63. 'An automated microseed matrix-screening method for protein crystallization’

How to make the seed stock

See www.douglas.co.uk/mms.com or sheet

1. Break crystals with a probe
2. Place contents of well in 50 µl of reservoir solution
3. Vortex with Hampton “Seed Bead”
4. Make a dilution series immediately
5. Freeze

Look after your seeds!

Microseeding

Douglas Instruments

Opticryst – a consortium of European institutions and companies aiming to improve crystal optimization. 2007 – 2010.

We decided to look into microseeding, especially the stability of seeds.

Microseeding

Douglas Instruments

Opticryst – a consortium of European institutions and companies aiming to improve crystal optimization. 2007 – 2010.

Stefan set up 30,000 drops and estimated the number of crystals In 15,000 drops!

random Microseed Matrix-Screening

Our questions:	*Take-home practical suggestions:*
(1) How can we get as many hits as possible?	
(2) How stable are the seed stocks?	
(3) Is "preseeding" the protein stock helpful?	
(4) How can we avoid salt crystals?	
(5) How can we get more diverse crystals?	
(6) How can we stabilize protein complexes, including heavy atom, small molecule and peptide derivatives ?	
(7) Can we harvest seed crystals from microfluidic devices?	
(8) What can you do if you have no crystals?	

Douglas Instruments

Protein	Source	Concentration
Glucose Isomerase	Hampton Research	33 mg/ml
Hemoglobin	Sigma Aldrich	60 mg/ml
Thaumatin	Sigma Aldrich	30 mg/ml
Thermolysin	Sigma Aldrich	15 mg/ml
Trypsin	Sigma Aldrich	30 mg/ml
Xylanase	Macro Crystal	36 mg/ml

“Receptive” conditions

Conditions where:

(1) crystals don’t grow without seeds in four drops, but

(2) crystals grow in at least three out of four drops with seeds.

Do any other precipitants work better than the Hit Solution for suspending seed crystals?

Focusing on "pregnant" conditions

	Regular screens (x2)	Seeds in Hit Sol. 10nl	Seeds in isopro 10nl	Seeds in PEG 600 10nl	Seeds in am.sul 10nl	Seeds in 50:50 am.su, Hit 10nl	Seeds in NaCl 10nl	Seeds in 50:50 NaCl, Hit 10nl	Seeds in prot. 10nl	Screen with Hit Sol. 10nl	Screen with PEG 600 10nl	Screen with am.sul. 10nl	Screen with NaCl 10nl	Screen with Hit Sol. 100nl

Douglas Instruments

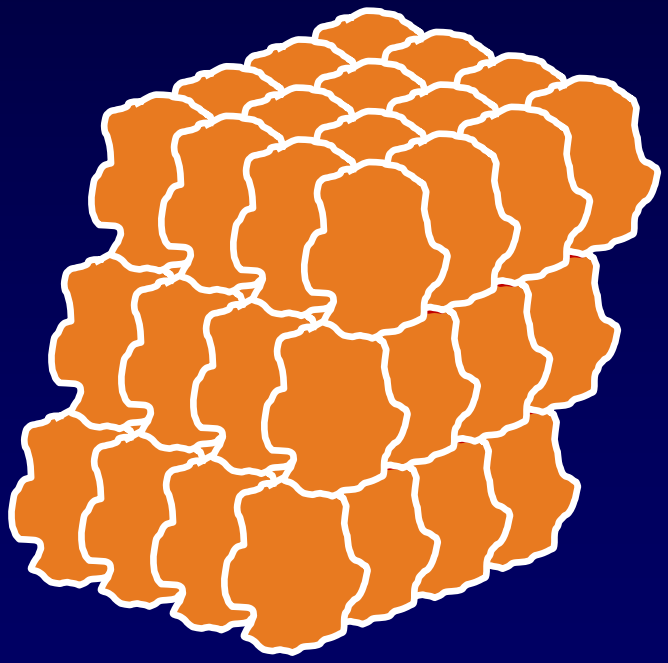
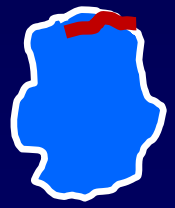
Suggested by Lesley Haire, National Institute for Medical Research

Cross-seeding

A natural approach, especially when you are adding something small e.g. a peptide or nucleic acid



Uncomplexed protein crystals

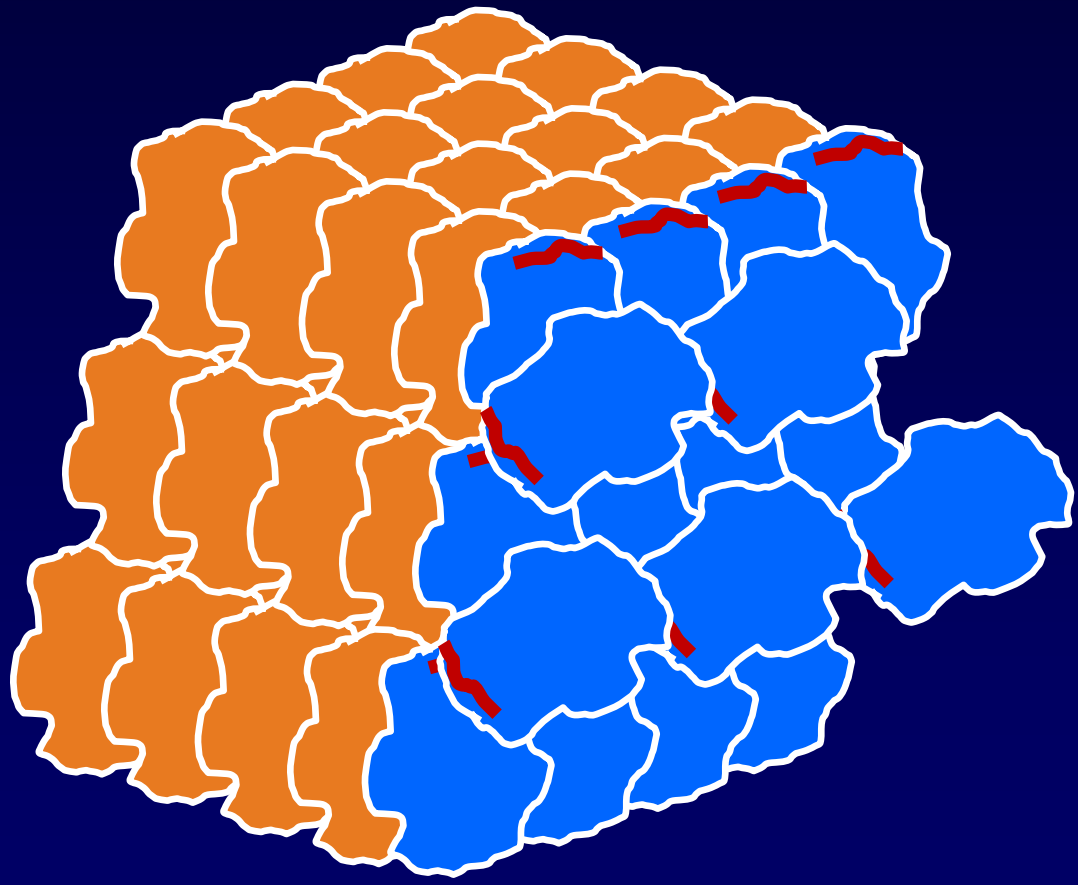


Complex

Douglas Instruments

Cross-seeding

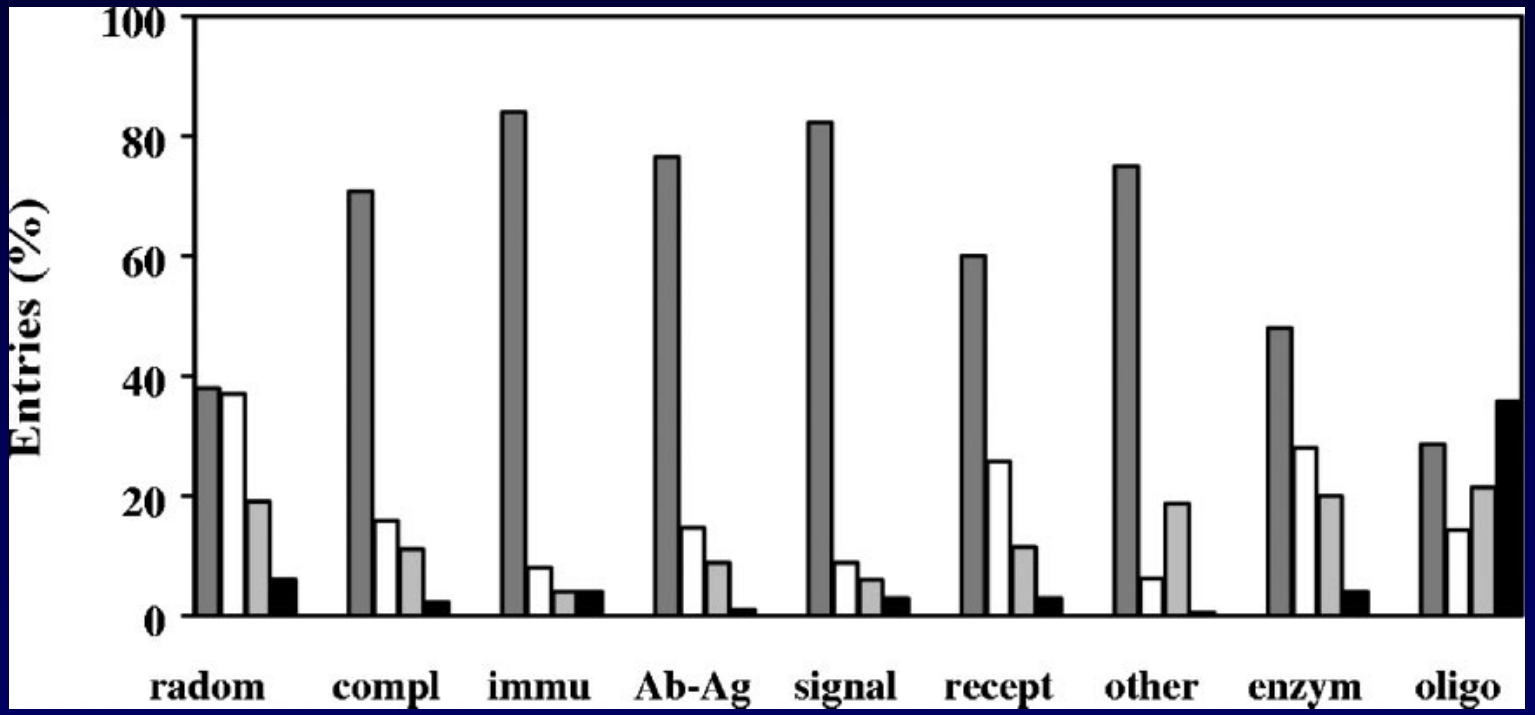
You don’t have to match the unit cell, only one of the structural planes of the crystals



Douglas Instruments

Crystallizing complexes

Radaev and Sun. Crystallization of protein-protein complexes.
J. Appl. Cryst. (2002). 35, 674-676



- PEG / (NH4)2SO4 / other salts / organic solvents (including 2-propanol, MPD, ethanol)

Random samples, all protein-protein complexes included in this survey, immune complexes, antibody-antigen complexes, signal transduction complexes, receptor and ligand complexes, miscellaneous protein-protein complexes, enzyme related complexes, oligomeric protein complexes

What can we replace the Hit Solution with?

	Regular screens (x2)	Seeds in Hit Sol. 10nl	Seeds in isopro 10nl	Seeds in PEG 600 10nl	Seeds in am.sul 10nl	Seeds in 50:50 am.su, Hit 10nl	Seeds in NaCl 10nl	Seeds in 50:50 NaCl, Hit 10nl	Seeds in prot. 10nl	Screen with Hit Sol. 10nl	Screen with PEG 600 10nl	Screen with am.sul. 10nl	Screen with NaCl 10nl	Screen with Hit Sol. 100nl

(4) How can we avoid salt crystals?	*Please read the paper!*
(5) How can we get more diverse crystals?	*Please read the paper!*
(6) How can we stabilize protein complexes, including heavy atom, small molecule and peptide derivatives ?	*Avoid high salt in your seed stock; remove ingredients .... test by incubation for 1 day*
(7) Can we harvest seed crystals from microfluidic devices?	*Please read the paper!*
(8) What can you do if you have no crystals?	*Please read the paper!*

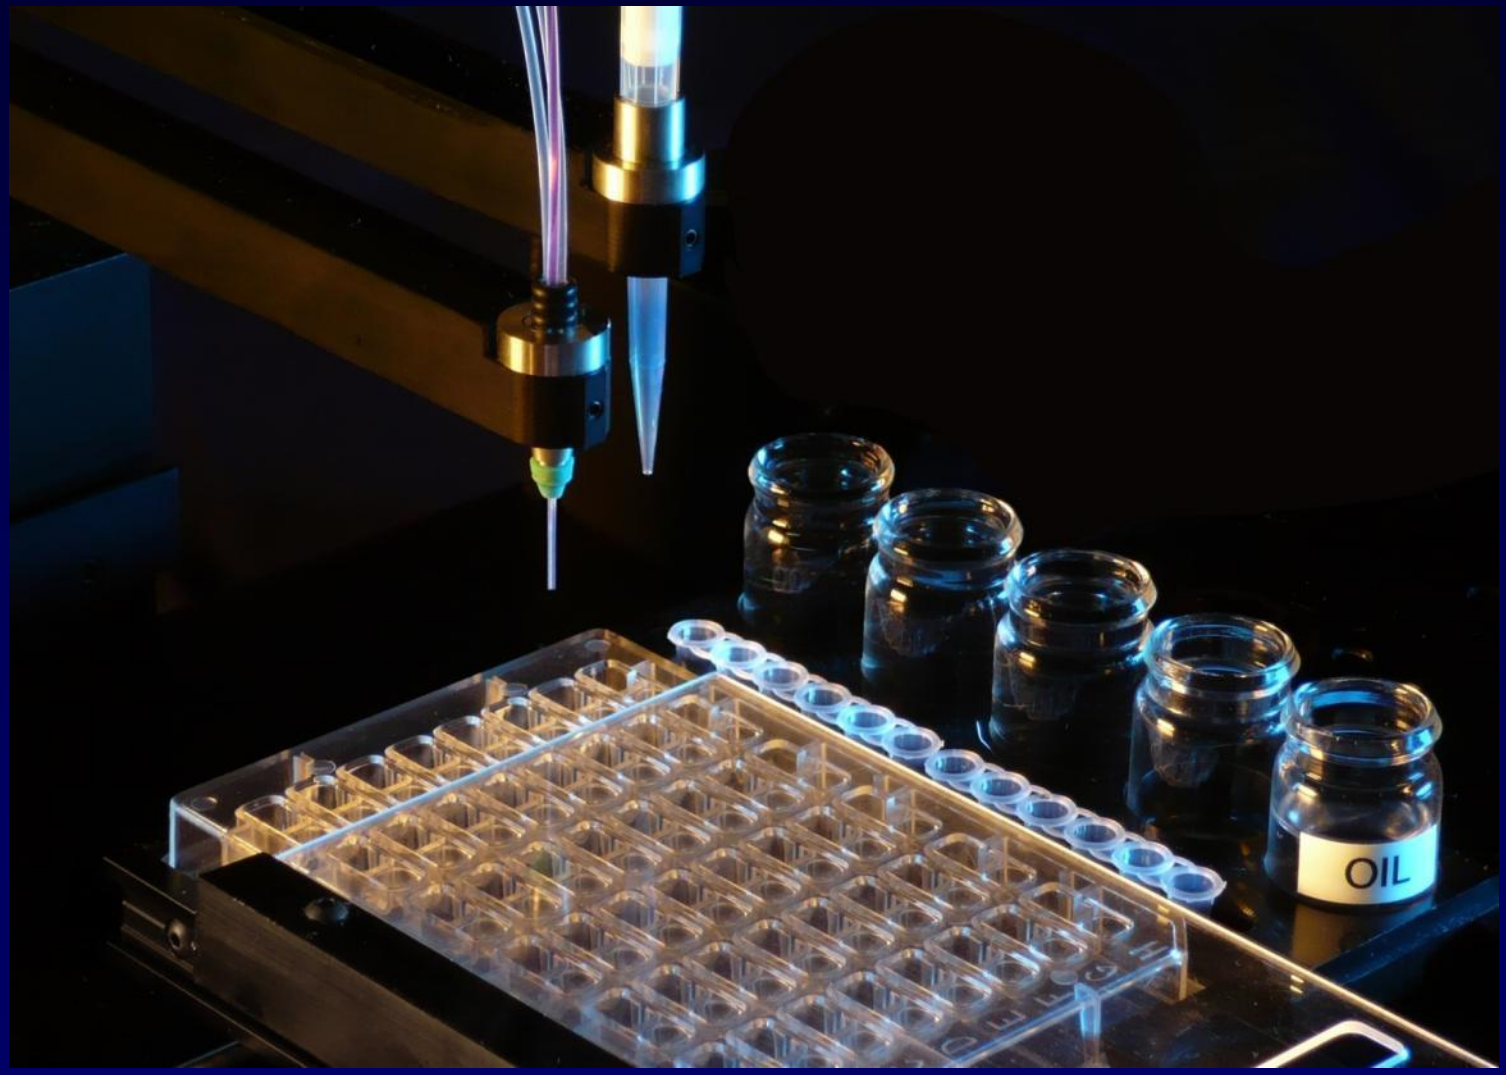
Douglas Instruments

Soaking experiments

You need a good supply of wells with about 5 crystals per drop

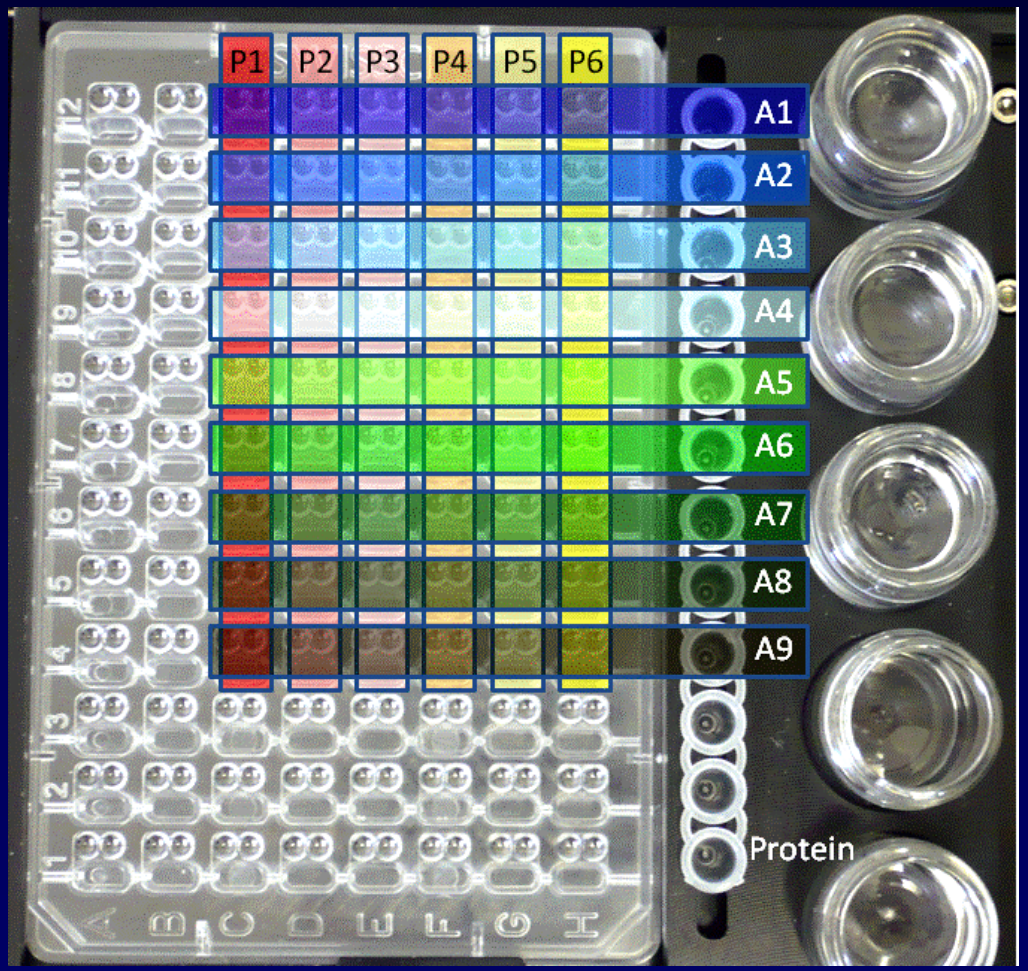
Seeding with diluted seed stock is “the only reliable way” to achieve this

New “combinatorial” experimental design



Douglas Instruments

New “combinatorial” experimental design

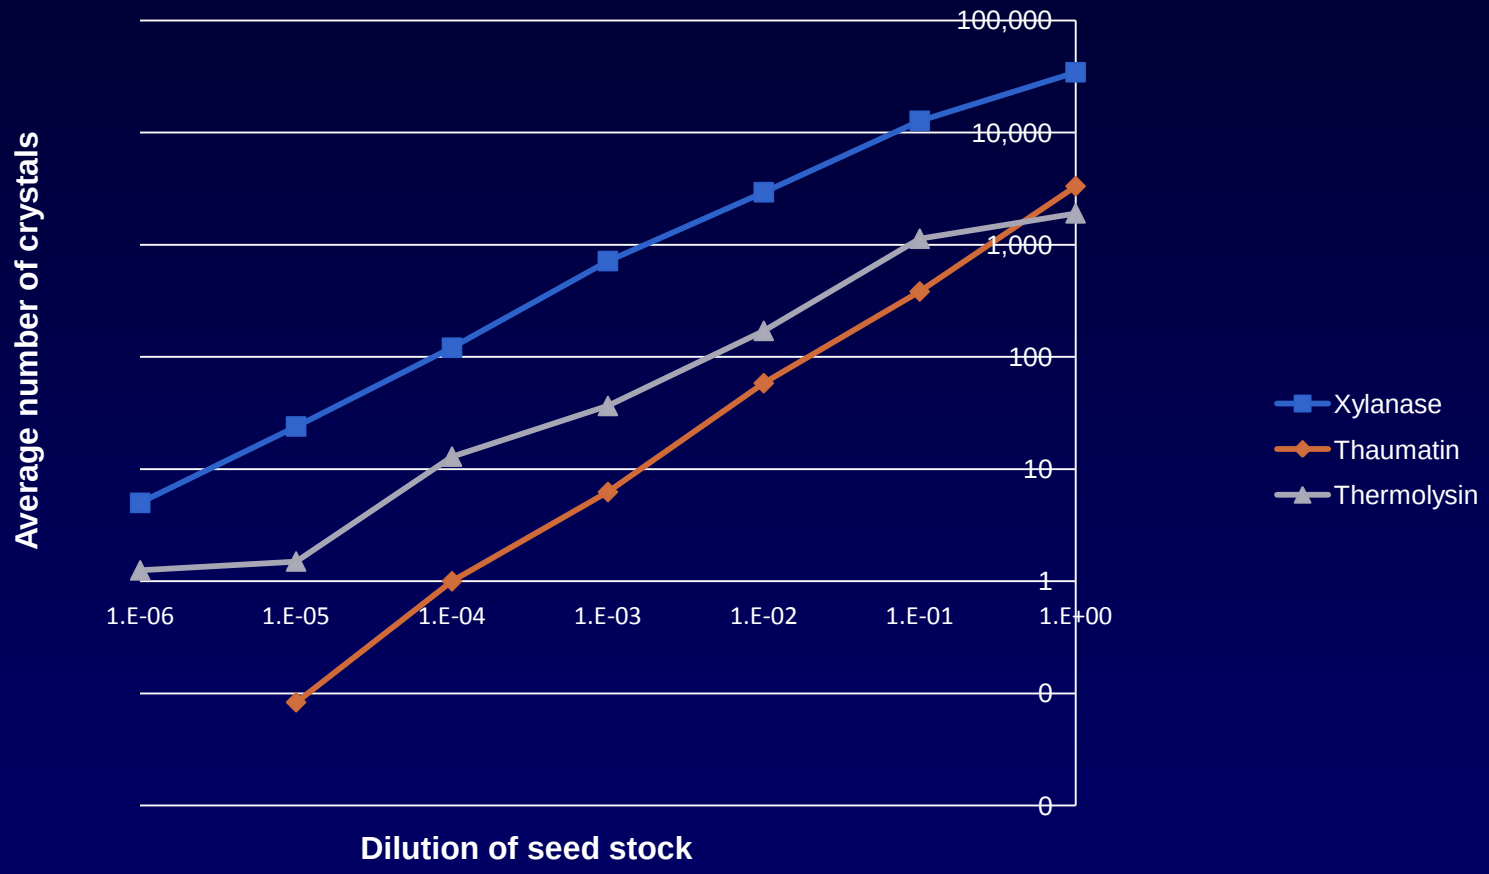


Microseeding:

A1: 100% seed stock
A2: 25% seed stock
A3: 6.3% seed stock
A4: 1.6% seed stock
A5: 0.4% seed stock
A6: 0.1% seed stock
A7: 0.02% seed stock
A8: 0.006% seed stock
A9: 0.002% seed stock

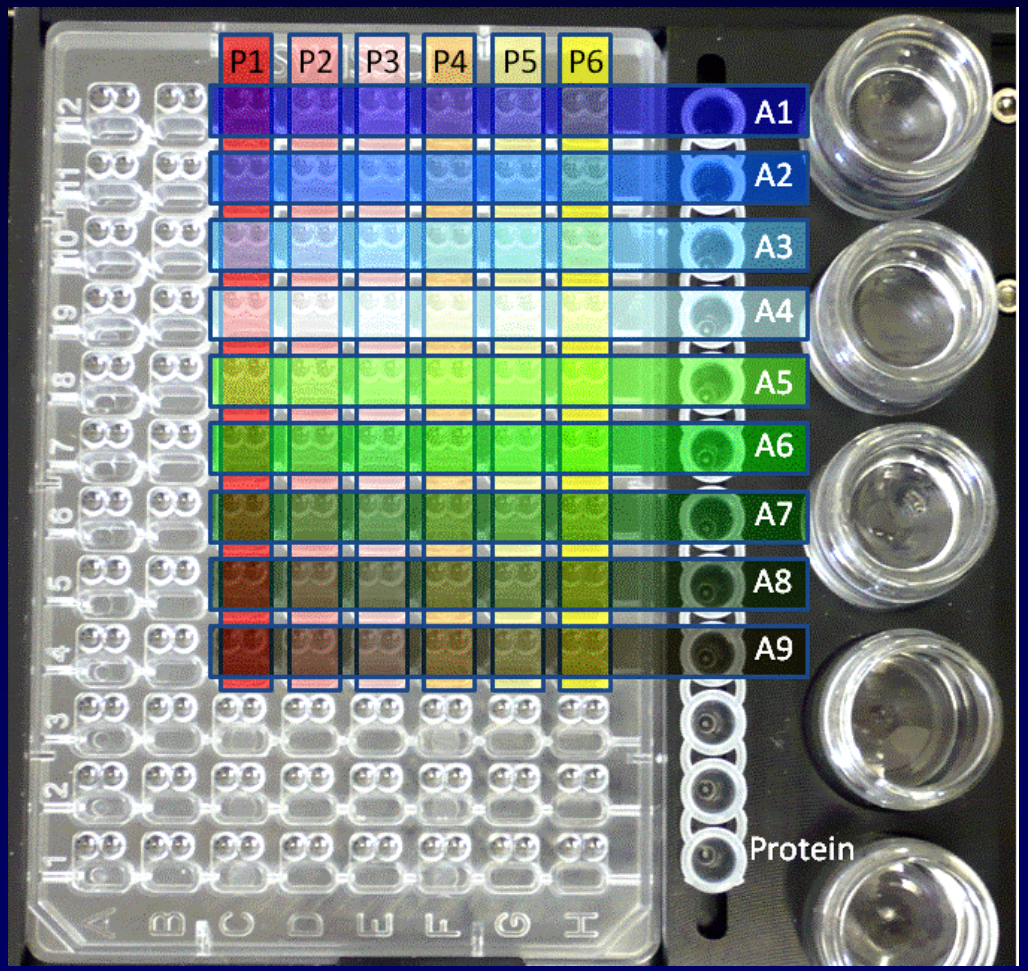
Douglas Instruments

New “combinatorial” experimental design



Douglas Instruments

New “combinatorial” experimental design



Or test up to 12
inhibitors or ligands

Douglas Instruments

Douglas Instruments

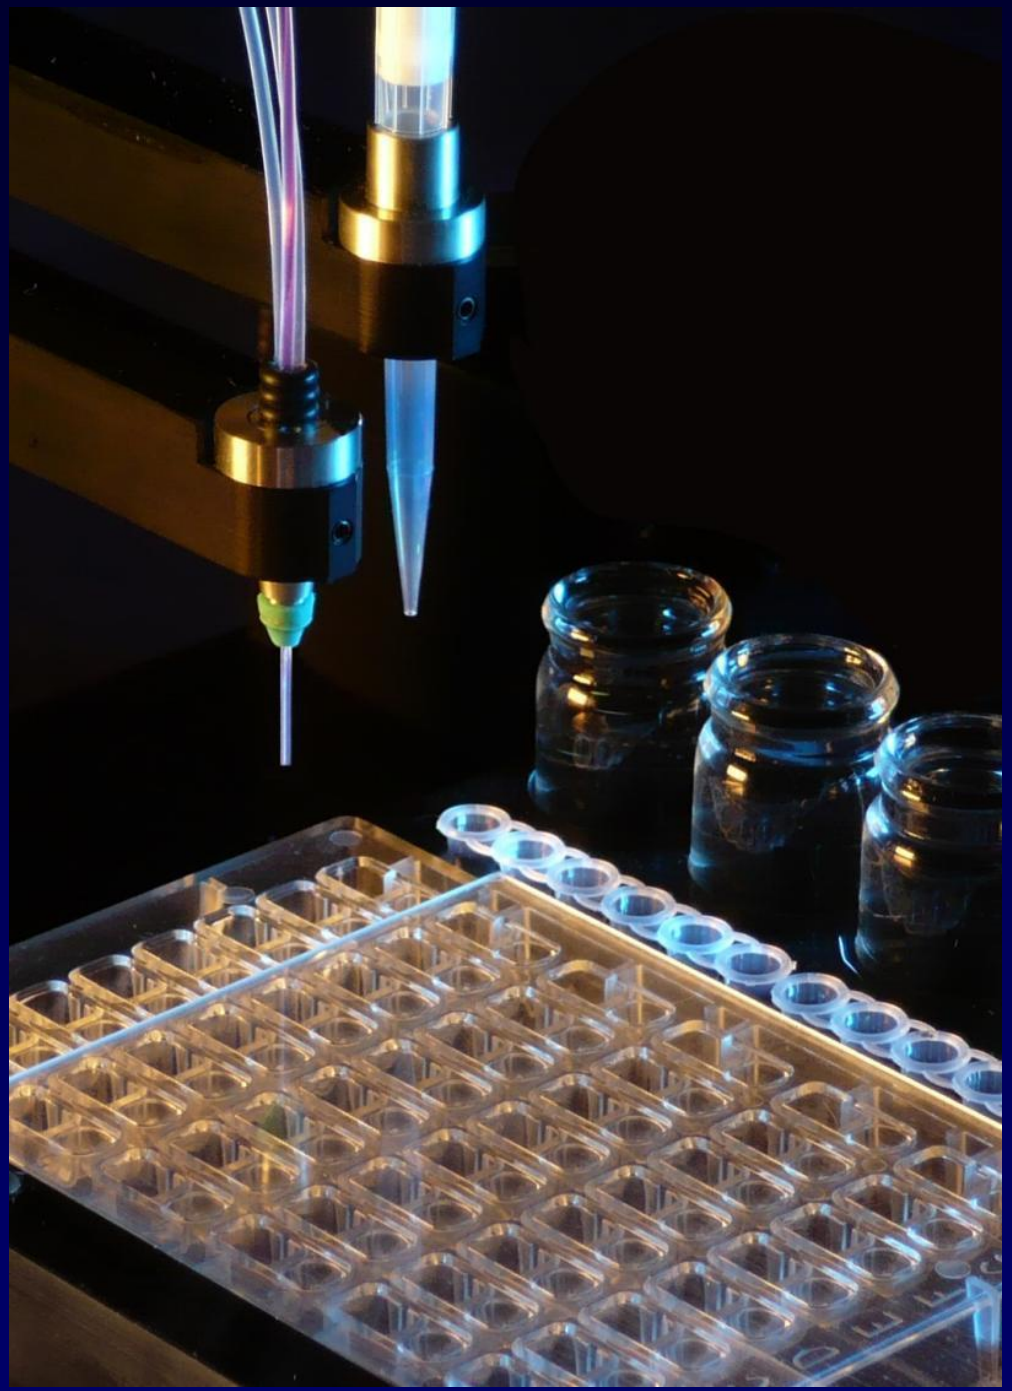
Thank you for listening!



Microseed it!

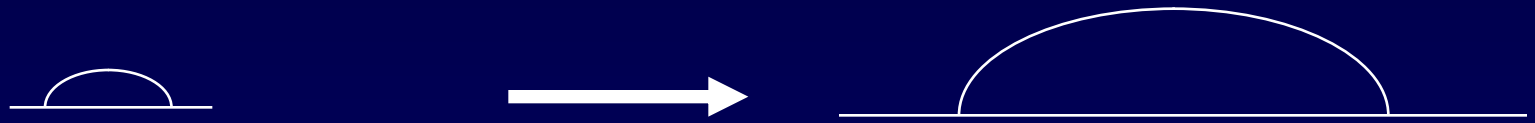
1. Scaling up
2. Microseeding with membrane proteins
3. Reshuffling ingredients

Patrick Shaw Stewart

Douglas Instruments Ltd

Douglas Instruments

Scaling up



100 + 100 nl

1 + 1 µl

Douglas Instruments

Scaling up

100 + 100 nl

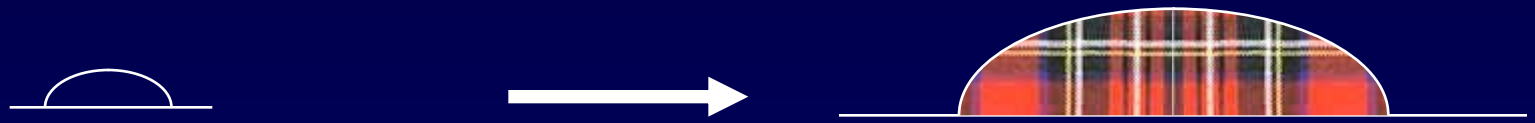
1 + 1 µl

Tartan indicates precipitation

(my family is Scottish)

Douglas Instruments

Scaling up

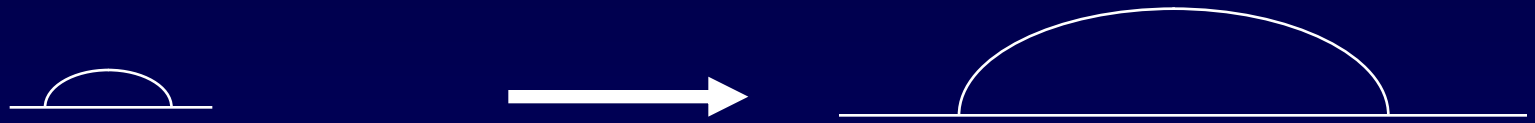


High surface to volume ratio

Low surface to volume ratio

- More protein is lost at the air/liquid interface
- Equilibration is faster

Scaling up

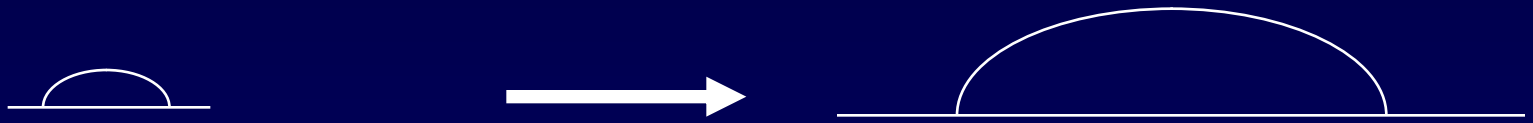


Try 200 nl (protein) +
100 nl (reservoir solution)

Scales up to 1 + 1 µl
(Heather Ringrose, Pfizer)

Douglas Instruments

Scaling up



100 nl (protein) + 100 nl (reservoir solution)

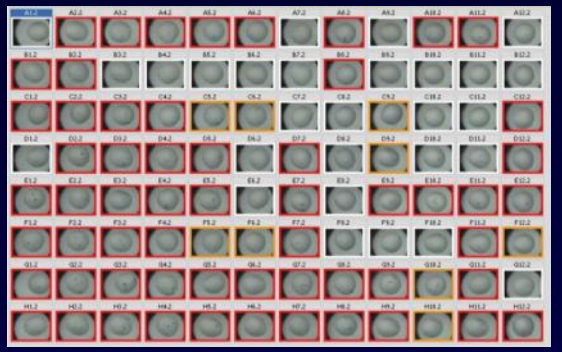
Scales up to 0.5 + 1 µl (Heather Ringrose, Pfizer)

Equilibrates faster

Increase the salt by 50 – 100%

Protein crystallization

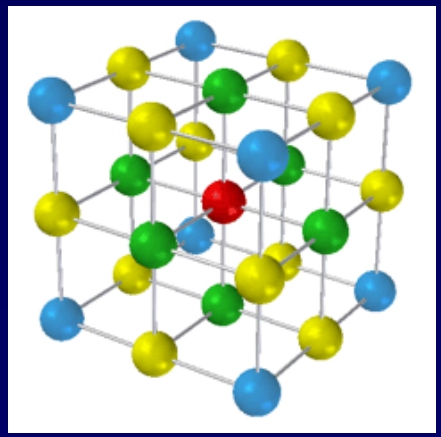
Step 1: screening with random solutions that have given crystals before x 96



Step 1.5: random microseeding

Easy!

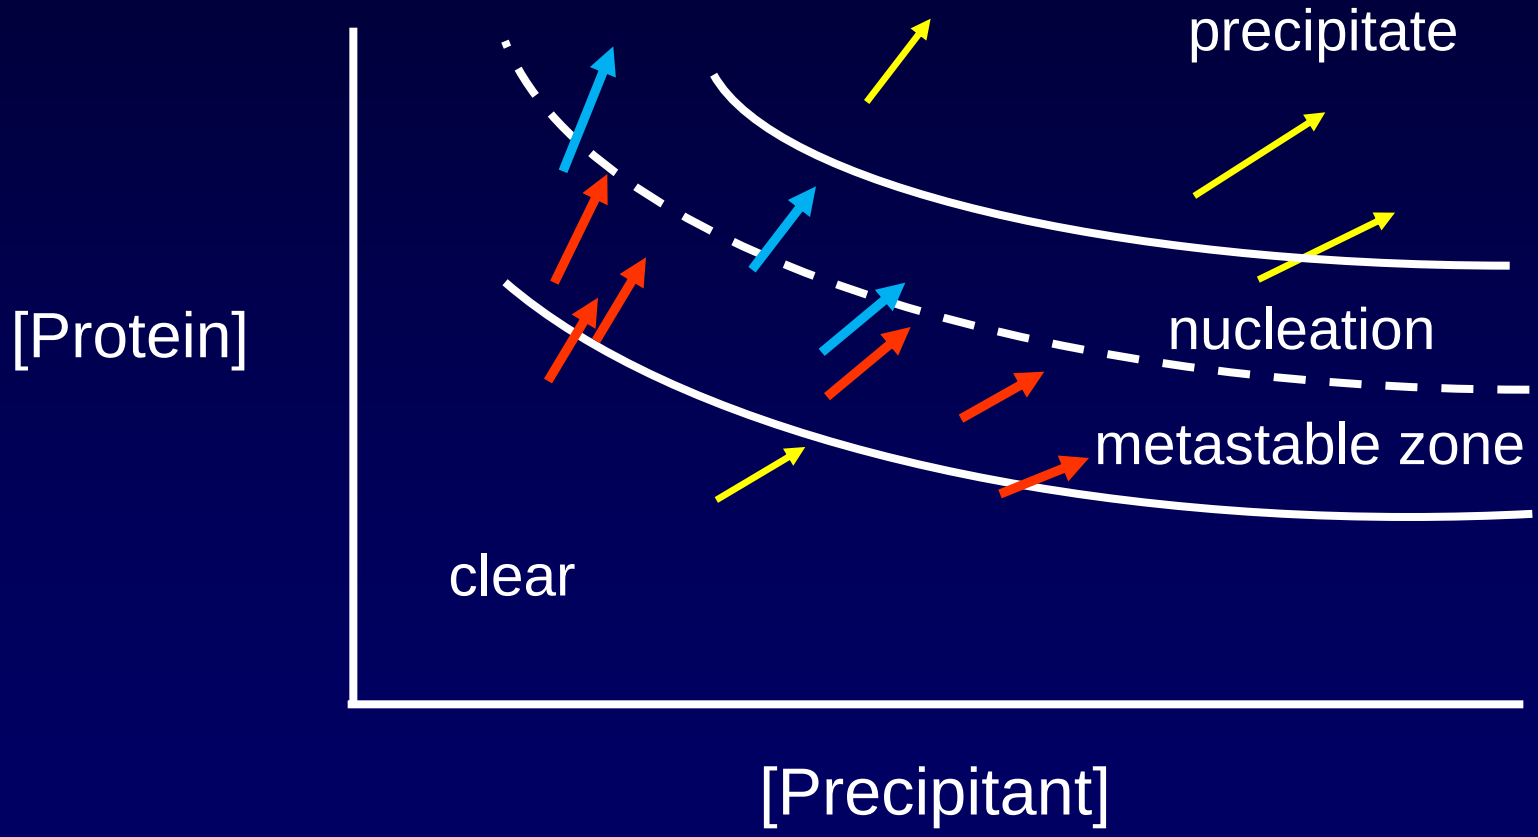
Step 2: optimization by making small changes



Modify your protein or make a new construct

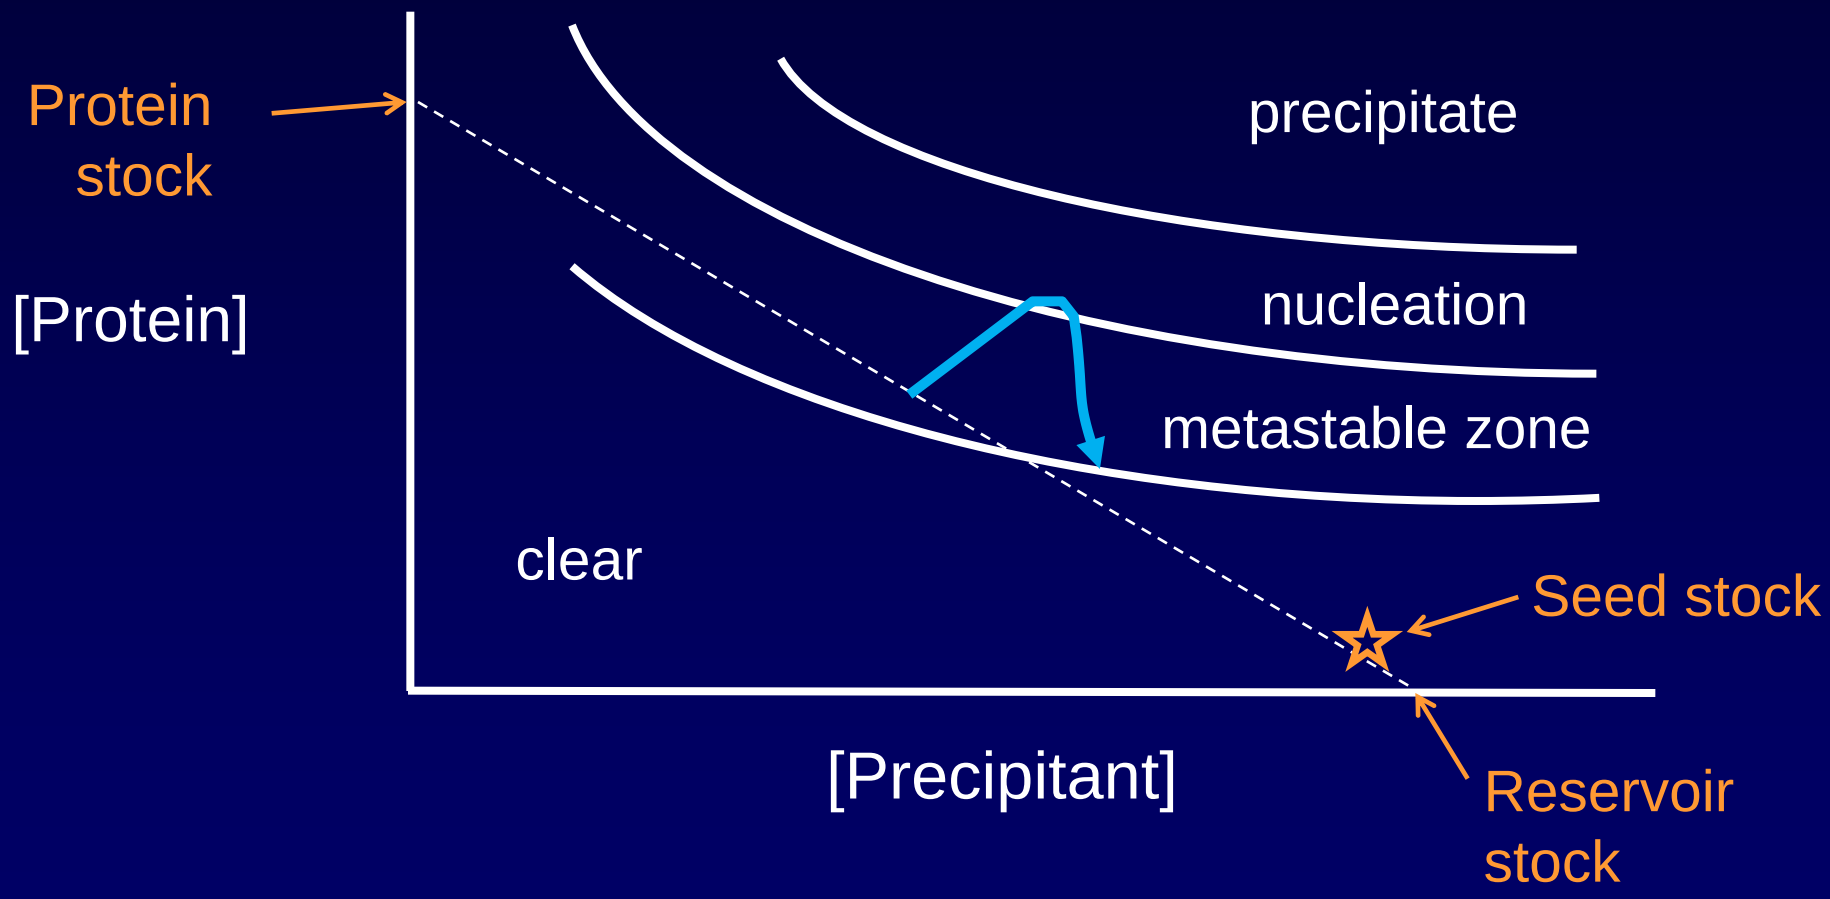
Douglas Instruments

Phase diagram of a protein



Douglas Instruments

Phase diagram of a protein



Douglas Instruments

rMMS with membrane proteins

Crystals of membrane proteins are often unstable

Remember that the reservoir normally has no detergent!

Harvest several large drops *without dilution*

1.5 µl is enough - if you have the right kind of robot!

See http://www.douglas.co.uk/MMS_proc.htm

Douglas Instruments

Matrix seeding volumes:

0.3 µl protein

+ 0.2 µl reservoir solution

+ 0.1 µl seed stock

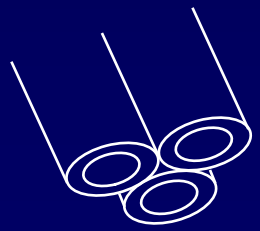
E.g. for membrane proteins:

0.3 µl protein

+ 0.29 µl reservoir solution

+ 0.01 µl seed stock

3-bore tip



Or: for membrane proteins:

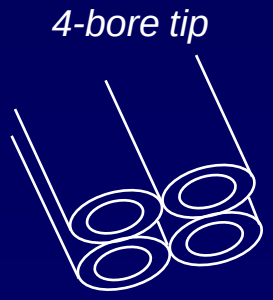
0.3 µl protein

+ 0.2 µl reservoir solution

+ 0.09 ul “hit solution” (additive)

+ 0.01 µl seed stock

4-bore tip



Douglas Instruments

Membrane proteins

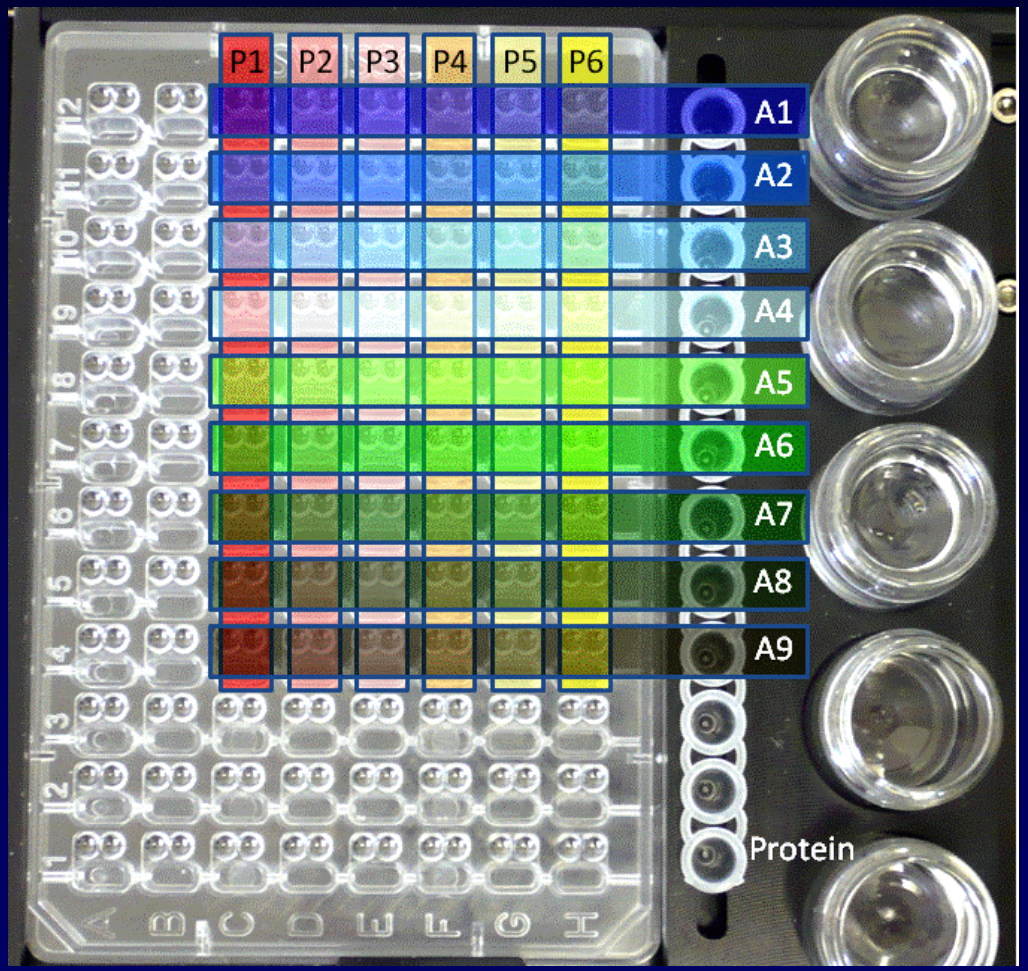
Collaboration with MPL at Diamond

1. Several proteins showed no improvement
2. One protein showed a different crystal form in the same conditions
3. One protein showed greatly improved diffraction

Christina Oswald showed that microseeding (more than) doubled the number of hits for a well-known membrane protein

Douglas Instruments

New “combinatorial” experimental design



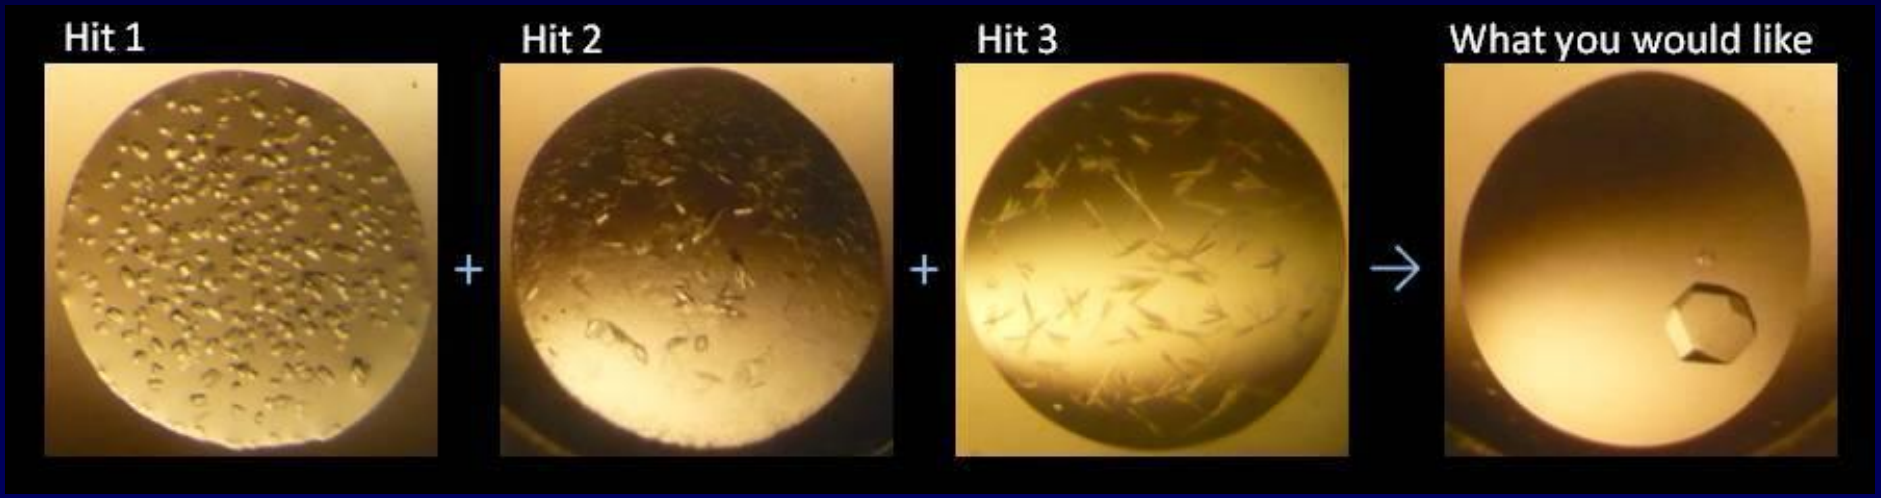
Microseeding:

A1: 100% seed stock
A2: 25% seed stock
A3: 6.3% seed stock
A4: 1.6% seed stock
A5: 0.4% seed stock
A6: 0.1% seed stock
A7: 0.02% seed stock
A8: 0.006% seed stock
A9: 0.002% seed stock

Douglas Instruments

New “combinatorial” experimental design

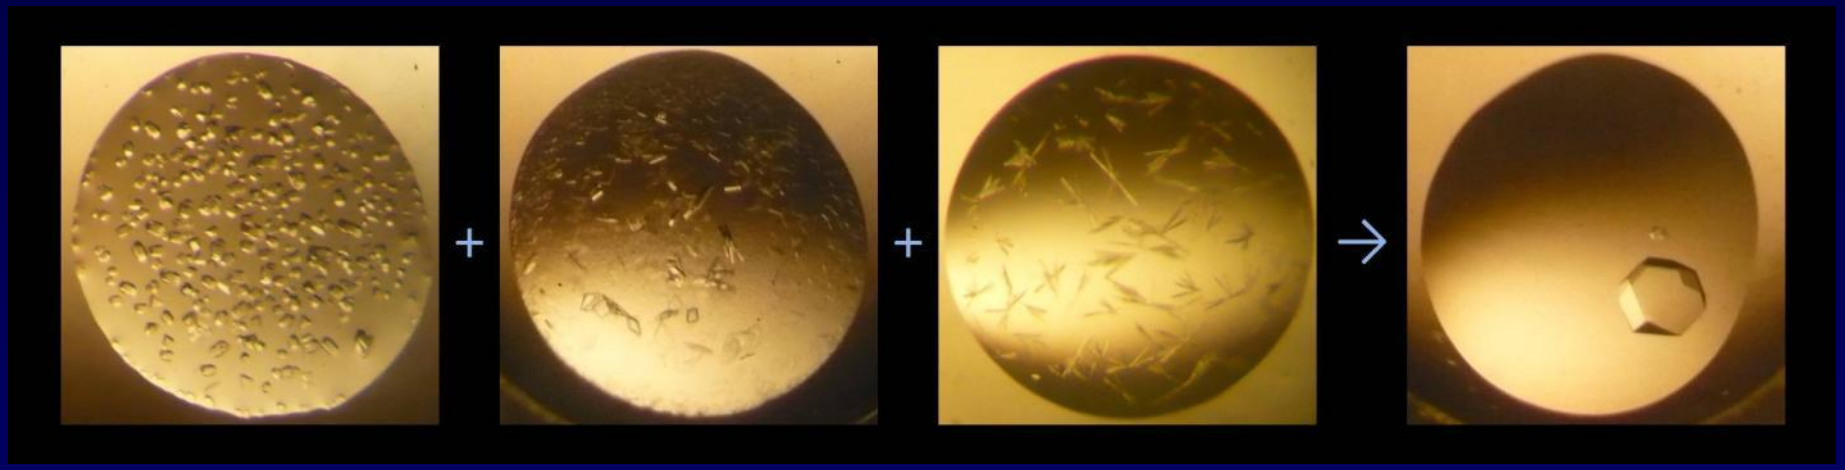
A third use -



Douglas Instruments

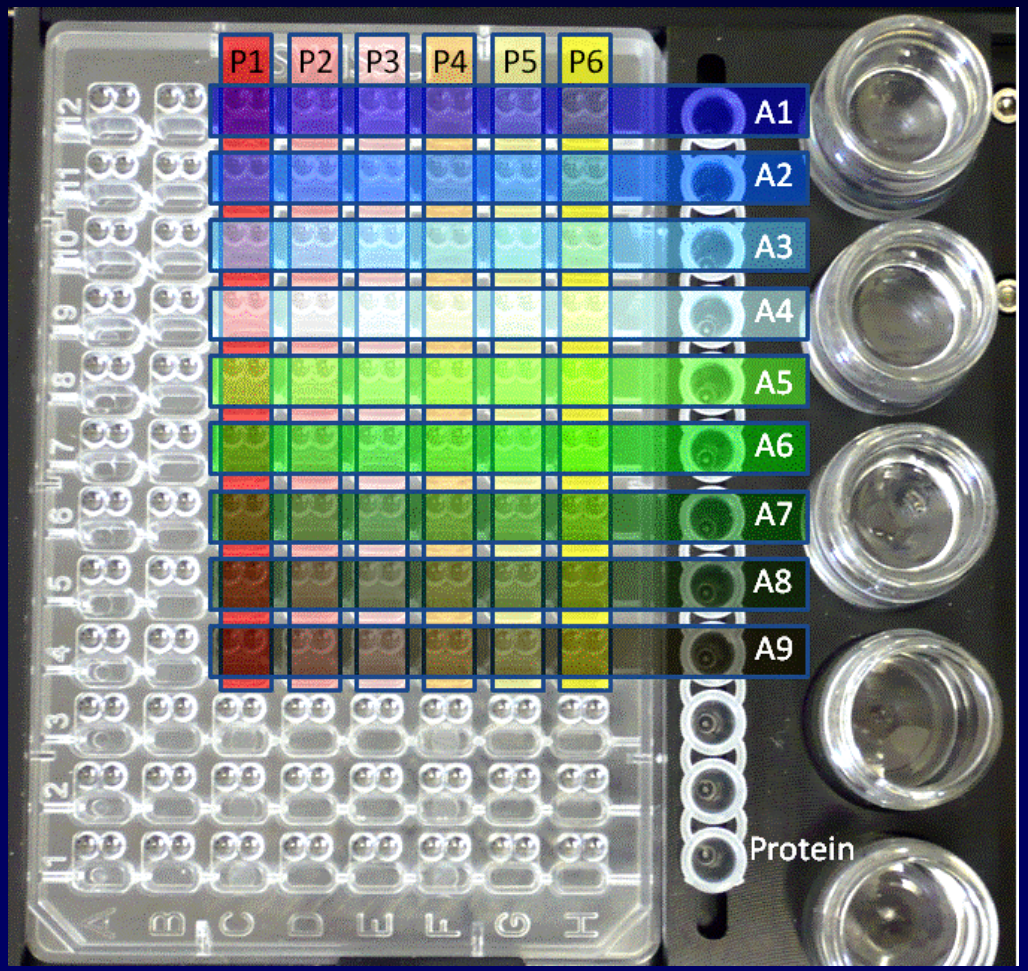
New “combinatorial” experimental design

1. PEG4000, MgCl2, citrate pH5
2. PEG600, CaCl2, TRIS pH8
3. NaCl, imidazole pH6



Douglas Instruments

New “combinatorial” experimental design



Original hits:

1. PEG4000, MgCl2, Citrate pH5
2. PEG600, CaCl2, TRIS pH8
3. NaCl, Imidazole pH6

P1, P2: PEG4000

P3, P4: PEG600

P5, P6: NaCl

A1: MgCl2

A2: MgCl2 + Citrate

A3: CaCl2 etc

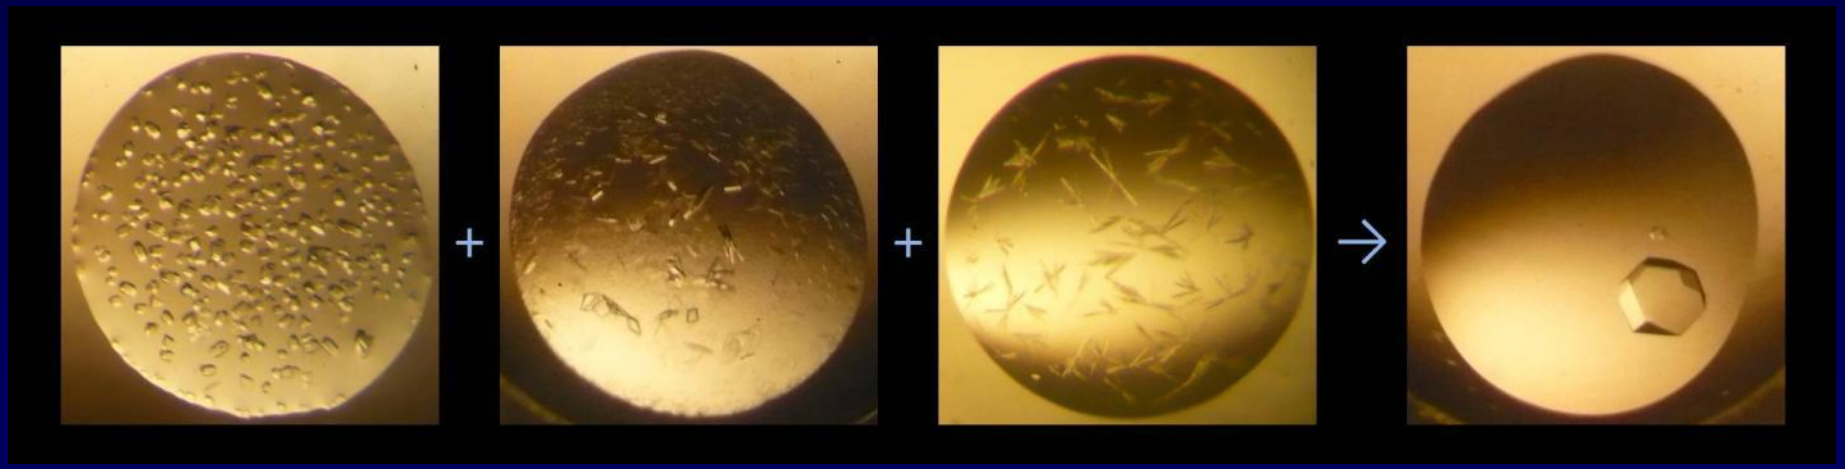
Ingredients can be reshuffled! This is equivalent to a “targeted screen”. Yellow indicates the best combination above.

Douglas Instruments

New “combinatorial” experimental design

1. PEG4000, MgCl2, citrate pH5
2. PEG600, CaCl2, TRIS pH8
3. NaCl, imidazole pH6

PEG 4000, CaCl2, imidazole pH6



Douglas Instruments

- Contact dispensing allows microseeding
- Almost no protein / seed is wasted
- Optimization
  - 2-d grid
  - (7-d Central Composite etc)
  - Combinatorial script

Douglas Instruments

rMMS: comments by Allan D'Arcy

1. Freeze your seed stock – then you can always reproduce your crystals (even years later)

2. rMMS greatly reduces the need for crystal optimization

3. So always do it – unless you can solve the structure with crystals taken straight from your initial screens

Douglas Instruments

Thank you for listening!

Microseeding paper:

Shaw Stewart et al., Cryst. Growth Des., 2011, 11 (8), p3432.
