Trieste - Italy  
25 May 2012

Given metric space  $X$ , a dynamical system  $T : X \rightarrow X$  and a real function (potential)  $f : X \rightarrow \mathbb{R}$ , the main problem in *Ergodic Optimization* is to guarantee the existence and to describe the support of the *maximizing measures* for the system, that is, to describe the set of measures satisfying:

$$\alpha(f) := \sup_{\mu \in \mathcal{M}_T} \int f d\mu$$

where  $\mathcal{M}_T$  denotes the set of the  $T$ -invariant borel probability measures.

Given metric space  $X$ , a dynamical system  $T : X \rightarrow X$  and a real function (potential)  $f : X \rightarrow \mathbb{R}$ , the main problem in *Ergodic Optimization* is to guarantee the existence and to describe the support of the *maximizing measures* for the system, that is, to describe the set of measures satisfying:

$$\alpha(f) := \sup_{\mu \in \mathcal{M}_T} \int f d\mu$$

where  $\mathcal{M}_T$  denotes the set of the  $T$ -invariant borel probability measures.

## Settings:

1.  $X$  compact or  $X$  non-compact (Polish Space) [our case].
2. The potential  $f : X \rightarrow \mathbb{R}$  always continuous or more (Lipschitz, Hölder, summable variation, Locally Hölder etc).
3.  $T$  is always continuous or more (expansive, hyperbolic, etc).

## Settings:

1.  $X$  compact or  $X$  non-compact (Polish Space) [our case].
2. The potential  $f : X \rightarrow \mathbb{R}$  always continuous or more (Lipschitz, Hölder, summable variation, Locally Hölder etc).
3.  $T$  is always continuous or more (expansive, hyperbolic, etc).

## Settings:

1.  $X$  compact or  $X$  non-compact (Polish Space) [our case].
2. The potential  $f : X \rightarrow \mathbb{R}$  always continuous or more (Lipschitz, Hölder, summable variation, Locally Hölder etc).
3.  $T$  is always continuous or more (expansive, hyperbolic, etc).

## Examples and results when $X$ is compact:

- Maximizing measures always exist.
  - When  $X$  is compact since the potential  $f$  is always assume continuous by compactness (of  $M_{\mathcal{T}}$ ) there exists a probability measure  $m$  in  $M_{\mathcal{T}}$  such that
$$\alpha(f) := \sup_{\mu \in \mathcal{M}_{\mathcal{T}}} \int f d\mu = \int f dm$$

The problem in this context it is to characterize the support of this measures.

## Examples and results when $X$ is compact:

- Maximizing measures always exist.
  - When  $X$  is compact since the potential  $f$  is always assume continuous by compactness (of  $M_{\mathcal{T}}$ ) there exists a probability measure  $m$  in  $M_{\mathcal{T}}$  such that
$$\alpha(f) := \sup_{\mu \in \mathcal{M}_{\mathcal{T}}} \int f d\mu = \int f dm$$

The problem in this context it is to characterize the support of this measures.

## Examples and results when $X$ is compact:

- Maximizing measures always exist.
  - When  $X$  is compact since the potential  $f$  is always assume continuous by compactness (of  $M_{\mathcal{T}}$ ) there exists a probability measure  $m$  in  $M_{\mathcal{T}}$  such that
$$\alpha(f) := \sup_{\mu \in \mathcal{M}_{\mathcal{T}}} \int f d\mu = \int f dm$$

The problem in this context it is to characterize the support of this measures.

## Examples:

1.  $X = S^1$ ,  $T(x) = 2x \bmod 1$ .

2.  $X = \Sigma = \{1, \dots, k\}^{\mathbb{N}}$  (full shift),  $T = \sigma$  (shift map).

Theorem: (T. Bousch and O. Jenkinson (2002), Bousch (2001))

Generically (in the potential  $f$ ) in  $C(X)$  the maximizing measure is unique and fully supported.

Examples:

1.  $X = S^1$ ,  $T(x) = 2x \text{ mod } 1$ .

2.  $X = \Sigma = \{1, \dots, k\}^{\mathbb{N}}$  (full shift),  $T = \sigma$  (shift map).

Theorem: (T. Bousch and O. Jenkinson (2002), Bousch (2001))

Generically (in the potential  $f$ ) in  $C(X)$  the maximizing measure is unique and fully supported.

## Main Conjecture

Roughly:

Generically in the space of Lipschitz potentials with  $X$  compact and  $T$  with suitable properties the maximizing measure is unique and supported in an periodic orbit.

Partial results: G. Contreras, A. Lopes and P. Thiullen (2001), T. Bousch (2000), A. Quas and J. Siefken (to Appear in ETDS).

Important Reference: O. Jenkinson - "Ergodic Optimization - DCDS 2006.

## Our Setting: non-compact Markov shifts

Given an infinite matrix  $\mathbf{A} : \mathbb{N} \times \mathbb{N} \rightarrow \{0, 1\}$ , we call by  $\Sigma_{\mathbf{A}}(\mathbb{N})$  the subset of  $\Sigma(\mathbb{N}) := \mathbb{N}^{\mathbb{N}}$  of allowable sequences, that is:

$$\Sigma_{\mathbf{A}}(\mathbb{N}) := \{x \in \Sigma(\mathbb{N}), \mathbf{A}(x_i, x_{i+1}) = 1 \forall i \geq 0\}.$$

Fixed  $\lambda \in (0, 1)$ , we define a metric on  $\Sigma_{\mathbf{A}}(\mathbb{N})$  by  $d(x, y) = \lambda^k$ , where  $k$  is the first coordinate where  $x_k \neq y_k$ . (Polish Space)

The matrix  $\mathbf{A}$  is *finitely primitive*, when there exist a finite subset  $\mathbb{F} \subseteq \mathbb{N}$  and an integer  $K_0 \geq 0$  such that, for any pair of symbols  $i, j \in \mathbb{N}$ , one can find  $l_1, l_2, \dots, l_{K_0} \in \mathbb{F}$  satisfying

$$\mathbf{A}(i, l_1)\mathbf{A}(l_1, l_2) \cdots \mathbf{A}(l_{K_0}, j) = 1.$$

## Our Setting: non-compact Markov shifts

Given an infinite matrix  $\mathbf{A} : \mathbb{N} \times \mathbb{N} \rightarrow \{0, 1\}$ , we call by  $\Sigma_{\mathbf{A}}(\mathbb{N})$  the subset of  $\Sigma(\mathbb{N}) := \mathbb{N}^{\mathbb{N}}$  of allowable sequences, that is:

$$\Sigma_{\mathbf{A}}(\mathbb{N}) := \{x \in \Sigma(\mathbb{N}), \mathbf{A}(x_i, x_{i+1}) = 1 \forall i \geq 0\}.$$

Fixed  $\lambda \in (0, 1)$ , we define a metric on  $\Sigma_{\mathbf{A}}(\mathbb{N})$  by  $d(x, y) = \lambda^k$ , where  $k$  is the first coordinate where  $x_k \neq y_k$ . (Polish Space)

The matrix  $\mathbf{A}$  is *finitely primitive*, when there exist a finite subset  $\mathbb{F} \subseteq \mathbb{N}$  and an integer  $K_0 \geq 0$  such that, for any pair of symbols  $i, j \in \mathbb{N}$ , one can find  $l_1, l_2, \dots, l_{K_0} \in \mathbb{F}$  satisfying

$$\mathbf{A}(i, l_1)\mathbf{A}(l_1, l_2) \cdots \mathbf{A}(l_{K_0}, j) = 1.$$

## Our Setting: non-compact Markov shifts

Given an infinite matrix  $\mathbf{A} : \mathbb{N} \times \mathbb{N} \rightarrow \{0, 1\}$ , we call by  $\Sigma_{\mathbf{A}}(\mathbb{N})$  the subset of  $\Sigma(\mathbb{N}) := \mathbb{N}^{\mathbb{N}}$  of allowable sequences, that is:

$$\Sigma_{\mathbf{A}}(\mathbb{N}) := \{x \in \Sigma(\mathbb{N}), \mathbf{A}(x_i, x_{i+1}) = 1 \forall i \geq 0\}.$$

Fixed  $\lambda \in (0, 1)$ , we define a metric on  $\Sigma_{\mathbf{A}}(\mathbb{N})$  by  $d(x, y) = \lambda^k$ , where  $k$  is the first coordinate where  $x_k \neq y_k$ . (Polish Space)

The matrix  $\mathbf{A}$  is *finitely primitive*, when there exist a finite subset  $\mathbb{F} \subseteq \mathbb{N}$  and an integer  $K_0 \geq 0$  such that, for any pair of symbols  $i, j \in \mathbb{N}$ , one can find  $l_1, l_2, \dots, l_{K_0} \in \mathbb{F}$  satisfying

$$\mathbf{A}(i, l_1)\mathbf{A}(l_1, l_2) \cdots \mathbf{A}(l_{K_0}, j) = 1.$$

$\pi : \Sigma_{\mathbf{A}}(\mathbb{N}) \rightarrow \mathbb{N}$  is the projection of the first coordinate, that is  $\pi(x) = \pi(x_0 x_1 x_2 \dots) = x_0$ .

Given a function  $f : \Sigma_{\mathbf{A}}(\mathbb{N}) \rightarrow \mathbb{R}$  the  $j$ -th variation of  $f$  is

$$V_j(f) := \sup\{f(x) - f(y) \mid \pi(\sigma^i(x)) = \pi(\sigma^i(y)) \text{ for } i = 0, \dots, j-1\},$$

We say that  $f$  has *bounded variation* (summable variation), when

$$V(f) := \sum_{j=1}^{\infty} V_j(f) < \infty$$

$f : \Sigma_{\mathbf{A}}(\mathbb{N}) \rightarrow \mathbb{R}$  is called *locally Hölder continuous* when there exists a constant  $H_f > 0$  such that, for all integer  $j \geq 1$ , we have

$$V_j(f) \leq H_f \lambda^j.$$

$\pi : \Sigma_{\mathbf{A}}(\mathbb{N}) \rightarrow \mathbb{N}$  is the projection of the first coordinate, that is  $\pi(x) = \pi(x_0x_1x_2\dots) = x_0$ .

Given a function  $f : \Sigma_{\mathbf{A}}(\mathbb{N}) \rightarrow \mathbb{R}$  the  $j$ -th variation of  $f$  is

$$V_j(f) := \sup\{f(x) - f(y) \mid \pi(\sigma^i(x)) = \pi(\sigma^i(y)) \text{ for } i = 0, \dots, j-1\},$$

We say that  $f$  has *bounded variation* (summable variation), when

$f : \Sigma_{\mathbf{A}}(\mathbb{N}) \rightarrow \mathbb{R}$  is called *locally Hölder continuous* when there exists a constant  $H_f > 0$  such that, for all integer  $j \geq 1$ , we have

$$V_j(f) \leq H_f \lambda^j.$$

$\pi : \Sigma_{\mathbf{A}}(\mathbb{N}) \rightarrow \mathbb{N}$  is the projection of the first coordinate, that is  $\pi(x) = \pi(x_0x_1x_2\dots) = x_0$ .

Given a function  $f : \Sigma_{\mathbf{A}}(\mathbb{N}) \rightarrow \mathbb{R}$  the  $j$ -th variation of  $f$  is

$$V_j(f) := \sup\{f(x) - f(y), \pi(\sigma^i(x)) = \pi(\sigma^i(y)) \text{ for } i = 0, \dots, j-1\},$$

We say that  $f$  has *bounded variation* (summable variation), when

$$V(f) := \sum_{j=1}^{\infty} V_j(f) < \infty$$

$f : \Sigma_{\mathbf{A}}(\mathbb{N}) \rightarrow \mathbb{R}$  is called *locally Hölder continuous* when there exists a constant  $H_f > 0$  such that, for all integer  $j \geq 1$ , we have

$$V_j(f) \leq H_f \lambda^j.$$

$\pi : \Sigma_{\mathbf{A}}(\mathbb{N}) \rightarrow \mathbb{N}$  is the projection of the first coordinate, that is  $\pi(x) = \pi(x_0x_1x_2\dots) = x_0$ .

Given a function  $f : \Sigma_{\mathbf{A}}(\mathbb{N}) \rightarrow \mathbb{R}$  the  $j$ -th variation of  $f$  is

$$V_j(f) := \sup\{f(x) - f(y), \pi(\sigma^i(x)) = \pi(\sigma^i(y)) \text{ for } i = 0, \dots, j-1\},$$

We say that  $f$  has *bounded variation* (summable variation), when

$$V(f) := \sum_{j=1}^{\infty} V_j(f) < \infty$$

$f : \Sigma_{\mathbf{A}}(\mathbb{N}) \rightarrow \mathbb{R}$  is called *locally Hölder continuous* when there exists a constant  $H_f > 0$  such that, for all integer  $j \geq 1$ , we have

$$V_j(f) \leq H_f \lambda^j.$$

We say that  $f$  *coercive* when

$$\limsup_{i \rightarrow \infty} f|_{[i]} = -\infty,$$

$[i] := \{x \in \Sigma_{\mathbf{A}}(\mathbb{N}), \pi(x) = i\}$  is the cylinder beginning with  $i$ .

This condition is satisfied when we have for example:

$$\sum_{i \in \mathbb{N}} \exp(\sup f|_{[i]}) < \infty.$$

The condition is usually imposed under the potential for the thermodynamic formalism, finite pressure etc

We say that  $f$  *coercive* when

$[i] := \{x \in \Sigma_{\mathbf{A}}(\mathbb{N}), \pi(x) = i\}$  is the cylinder beginning with  $i$ .

This condition is satisfied when we have for example:

$$\sum_{i \in \mathbb{N}} \exp(\sup f|_{[i]}) < \infty.$$

The condition is usually imposed under the potential for the thermodynamic formalism, finite pressure etc

When the matrix  $\mathbf{A}$  is finitely primitive and  $f$  satisfies the last condition:

Theorem (O. Jenkinson, R. D. Mauldin and M. Urbański 05')

The family of Gibbs measures  $(\mu_{\beta f})_{\beta \geq 1}$  has at list one weak accumulation point as  $\beta \rightarrow \infty$ . Any accumulation point  $\mu$  is a maximizing measure for  $f$ , and  $\lim_{\beta \rightarrow \infty} \int f d\mu_{\beta f} = \int f d\mu$ .

Proof: Prohorov 's theorem and use that the measures  $\mu_{\beta f}$  are equilibrium states.

Theorem (I. D. Morris 07')

Assuming the conditions above we have that there exists a finite set  $\mathcal{A} \subset \mathbb{N}$  such that

$$\beta_f = \max_{\substack{\mu \in \mathcal{M}_\sigma \\ \text{supp } \mu \subseteq \Sigma_{\mathbf{A}}(\mathcal{A})}} \int f d\mu.$$

When the matrix  $\mathbf{A}$  is finitely primitive and  $f$  satisfies the last condition:

Theorem (O. Jenkinson, R. D. Mauldin and M. Urbański 05')

$$f + u - u \circ \sigma \leq m(f).$$

Given  $\mathbf{x} \in \Sigma_{\mathbf{A}}(\mathbb{N})$ , define

$$u(\mathbf{x}) := \sup \left\{ S_k(f - m(f))(\mathbf{y}) : k \geq 0, \mathbf{y} \in \Sigma_{\mathbf{A}}(\mathbb{N}), \sigma^k(\mathbf{y}) = \mathbf{x} \right\}.$$

## Proposition

Let  $\Sigma_{\mathbf{A}}(\mathbb{N})$  be a finitely primitive Markov subshift on a countable alphabet. Suppose  $u \in C^0(\Sigma_{\mathbf{A}}(\mathbb{N}))$  is a bounded sub-action for a bounded above and coercive potential  $f \in C^0(\Sigma_{\mathbf{A}}(\mathbb{N}))$ . If  $\mu \in \mathcal{M}_{\sigma}$  is an  $f$ -maximizing probability, then  $\mu$  is supported in a Markov subshift on a finite alphabet.

Let  $\mu \in \mathcal{M}_{\sigma}$  be an  $f$ -maximizing probability. Since  $u \in C^0(\Sigma)$  is a sub-action for the potential  $f$ , we have

$$f + u - u \circ \sigma - m(f) \leq 0 \quad \text{and} \quad \int (f + u - u \circ \sigma - m(f)) d\mu = 0.$$

Therefore, the support of  $\mu$  is a subset of the closed set  $(f + u - u \circ \sigma - m(f))^{-1}(0)$ .

## Proposition

Let  $\Sigma_{\mathbf{A}}(\mathbb{N})$  be a finitely primitive Markov subshift on a countable alphabet. Suppose  $u \in C^0(\Sigma_{\mathbf{A}}(\mathbb{N}))$  is a bounded sub-action for a bounded above and coercive potential  $f \in C^0(\Sigma_{\mathbf{A}}(\mathbb{N}))$ . If  $\mu \in \mathcal{M}_{\sigma}$  is an  $f$ -maximizing probability, then  $\mu$  is supported in a Markov subshift on a finite alphabet.

Let  $\mu \in \mathcal{M}_{\sigma}$  be an  $f$ -maximizing probability. Since  $u \in C^0(\Sigma)$  is a sub-action for the potential  $f$ , we have

$$f + u - u \circ \sigma - m(f) \leq 0 \quad \text{and} \quad \int (f + u - u \circ \sigma - m(f)) d\mu = 0.$$

Therefore, the support of  $\mu$  is a subset of the closed set  $(f + u - u \circ \sigma - m(f))^{-1}(0)$ .

## Proposition

*Let  $\Sigma_{\mathbf{A}}(\mathbb{N})$  be a finitely primitive Markov subshift on a countable alphabet. Suppose  $u \in C^0(\Sigma_{\mathbf{A}}(\mathbb{N}))$  is a bounded sub-action for a bounded above and coercive potential  $f \in C^0(\Sigma_{\mathbf{A}}(\mathbb{N}))$ . If  $\mu \in \mathcal{M}_{\sigma}$  is an  $f$ -maximizing probability, then  $\mu$  is supported in a Markov subshift on a finite alphabet.*

Let  $\mu \in \mathcal{M}_{\sigma}$  be an  $f$ -maximizing probability. Since  $u \in C^0(\Sigma)$  is a sub-action for the potential  $f$ , we have

$$f + u - u \circ \sigma - m(f) \leq 0 \quad \text{and} \quad \int (f + u - u \circ \sigma - m(f)) d\mu = 0.$$

Therefore, the support of  $\mu$  is a subset of the closed set  $(f + u - u \circ \sigma - m(f))^{-1}(0)$ .

Let  $\eta > 0$  be a real constant. As  $f$  is coercive and  $u$  is bounded, there exists  $\mathcal{I} \in \mathbb{Z}_+$  such that

$$\sup_{i > \mathcal{I}} (f + u - u \circ \sigma - m(f))|_{[i]} < -\eta.$$

In particular,  $\mu(\cup_{i > \mathcal{I}} [i]) = 0$  and then  $\text{supp}(\mu) \subset \cup_{i \leq \mathcal{I}} [i]$ .

Since  $\text{supp}(\mu)$  is a  $\sigma$ -invariant set

$$\text{supp}(\mu) \subset \cap_{k \geq 0} \sigma^{-k} \left( \cup_{i \leq \mathcal{I}} [i] \right) = \Sigma_{\mathbf{A}}(\mathcal{I}).$$

Let  $\eta > 0$  be a real constant. As  $f$  is coercive and  $u$  is bounded, there exists  $\mathcal{I} \in \mathbb{Z}_+$  such that

$$\sup_{i > \mathcal{I}} (f + u - u \circ \sigma - m(f))|_{[i]} < -\eta.$$

In particular,  $\mu(\cup_{i > \mathcal{I}} [i]) = 0$  and then  $\text{supp}(\mu) \subset \cup_{i \leq \mathcal{I}} [i]$ .

Since  $\text{supp}(\mu)$  is a  $\sigma$ -invariant set

$$\text{supp}(\mu) \subset \bigcap_{k \geq 0} \sigma^{-k} \left( \cup_{i \leq \mathcal{I}} [i] \right) = \Sigma_{\mathbf{A}}(\mathcal{I}).$$

Let  $\eta > 0$  be a real constant. As  $f$  is coercive and  $u$  is bounded, there exists  $\mathcal{I} \in \mathbb{Z}_+$  such that

$$\sup_{i > \mathcal{I}} (f + u - u \circ \sigma - m(f))|_{[i]} < -\eta.$$

In particular,  $\mu(\cup_{i > \mathcal{I}} [i]) = 0$  and then  $\text{supp}(\mu) \subset \cup_{i \leq \mathcal{I}} [i]$ .

Since  $\text{supp}(\mu)$  is a  $\sigma$ -invariant set

$$\text{supp}(\mu) \subset \cap_{k \geq 0} \sigma^{-k} \left( \cup_{i \leq \mathcal{I}} [i] \right) = \Sigma_{\mathbf{A}}(\mathcal{I}).$$

R. Bissacot and E. Garibaldi (Bull. Braz. Math. Soc. 2010)

## Theorem

Suppose  $\Sigma_{\mathbf{A}}(\mathbb{N})$  is shift with  $\mathbf{A}$  finitely primitive. Let  $f : \Sigma_{\mathbf{A}}(\mathbb{N}) \rightarrow \mathbb{R}$  be a bounded above, coercive and locally Hölder continuous potential satisfying  $\inf_{i \in \mathbb{F}} f|_{[i]} > -\infty$ . Then, there exists an integer  $\mathcal{I} > I_{\mathbb{F}}$  such that

$$m(f) = \max_{\substack{\mu \in \mathcal{M}_{\sigma} \\ \text{supp } \mu \subseteq \Sigma_{\mathbf{A}}(\mathcal{I})}} \int f \, d\mu.$$

In particular, maximizing measures do exist. Furthermore, there exists a compact  $\sigma$ -invariant set  $\Omega \subseteq \Sigma_{\mathbf{A}}(\mathcal{I})$  such that  $\mu \in \mathcal{M}_{\sigma}$  is  $f$ -maximizing if, and only if,  $\mu$  is supported in  $\Omega$ .

Key Fact: The invariant measures supported in periodic orbits are dense on the set of ergodic measures. (Parthasarathy- 1961)

Including some results with weaker hypothesis. Bounded Variation instead of locally Hölder continuous, for example.

# Connection with phase transitions

## Renewal shifts

Example: Let  $A = (a_{ij})_{i,j \in \mathbb{N}}$  be the transition matrix such that there exists an increasing sequence of naturals  $(d_i)_{i \in \mathbb{N}}$  for which

$$a_{11} = a_{i+1,i} = a_{1,d_i} = 1, \quad \forall i \in \mathbb{N}$$

and the others coefficients are zero.

## Theorem (O. Sarig - 2001)

Let  $\Sigma$  be a Renewal Shift and  $f$  a locally Hölder potential such that  $\sup f < \infty$ . Then there exists a constant  $t_c \in (0, \infty]$  such that

- For  $0 < t < t_c$  there exists an equilibrium probability measure  $\mu_t$  corresponding to  $tf$ . For  $t > t_c$  there is no equilibrium probability measures corresponding to  $tf$ ;
- $P(tf)$  is real analytic on  $(0, t_c)$  and linear on  $(t_c, \infty)$ . At  $t_c$ , it is continuous but not analytic.

## Theorem (G. Iommi - 2007)

Let  $\Sigma$  be a Renewal Shift and  $f$  a locally Hölder potential such that  $\sup f < \infty$ . Then

- For  $t_c = \infty$ , then there exists maximizing measures  $\mu_t$  for  $tf$ .
- If  $t_c < \infty$ , then there are no maximizing measures for  $f$  and  $M = \alpha(f)$ , where  $M$  is the slope linear part of the pressure  $P(tf)$ .

We say that  $\mathbf{A}$  is *irreducible* when for any  $(i, j) \in \mathbb{N}^2$  there exists a natural number  $k(i, j)$  and a word  $y_1 y_2 \dots y_k$  such that  $iy_1 y_2 \dots y_k j$  is an allowable word:  $\mathbf{A}(i, y_1) = 1$ ,  $\mathbf{A}(y_i, y_{i+1}) = 1$  for  $i = 1, \dots, k-1$  and  $\mathbf{A}(y_k, j) = 1$ .

## Theorem (R. Bissacot and R. Freire - arxiv )

Let  $\sigma$  be the shift on  $\Sigma_{\mathbf{A}}(\mathbb{N})$  with  $\mathbf{A}$  irreducible and let be  $f : \Sigma_{\mathbf{A}}(\mathbb{N}) \rightarrow \mathbb{R}$  be a function with bounded variation and coercive. Then, there is a finite set  $\mathcal{A} \subset \mathbb{N}$  such that  $\mathbf{A}|_{\mathcal{A} \times \mathcal{A}}$  is irreducible and

$$\alpha(f) = \sup_{\mu \in \mathcal{M}_{\sigma}(\Sigma_{\mathbf{A}}(\mathcal{A}))} \int f \, d\mu.$$

Furthermore, if  $\nu$  is a maximizing measure, then

$$\text{supp } \nu \subset \mathcal{M}_{\sigma}(\Sigma_{\mathbf{A}}(\mathcal{A})).$$

## Theorem

Let  $\Sigma$  be a subshift on  $\Sigma_{\mathbf{A}}(\mathbb{N})$  with  $\mathbf{A}$  irreducible,  $f : \Sigma_{\mathbf{A}}(\mathbb{N}) \rightarrow \mathbb{R}$  be a function with bounded variation. Given  $\epsilon > 0$  assume there are naturals  $l_2 > l_1 > 0$  such that

$$\sup f|_{[j]} < \alpha(f) - \epsilon \quad \forall j \geq l_1,$$

and

$$\sup f|_{[j]} < \min\{C_1, C_2\} \quad \forall j \geq l_2,$$

where  $C_1$  and  $C_2$  are constants (depending on  $l_1$ ).

$$C_1 = - (P_0 |\min f|_{\Sigma_{\mathbf{A}}(\mathcal{A}_1)}| + (P_0 - 1)|m(f)| + 2V(f)) ,$$

$$C_2 = m(f) - \epsilon - V(f).$$

Then, there is a finite set  $\mathcal{A} \subset \mathbb{N}$  such that  $\mathbf{A}|_{\mathcal{A} \times \mathcal{A}}$  is irreducible and

$$\alpha(f) = \sup_{\mu \in \mathcal{M}_\sigma(\Sigma_{\mathbf{A}}(\mathcal{A}))} \int f \, d\mu.$$

Furthermore, if  $\nu$  is a maximizing measure, then

$$\text{supp } \nu \subset \mathcal{M}_\sigma(\Sigma_{\mathbf{A}}(\mathcal{A})).$$

If we consider the alphabet  $\mathcal{I}_1 := \{0, 1, \dots, l_1 - 1\}$  we still have a problem that maybe there are no allowable sequences only with such symbols and, besides, the shift does not need to be irreducible when restrict to such sequences. So we complete  $\mathcal{I}_1$  to a finite alphabet  $\mathcal{A}_1$  in the following manner:

We choose, for each pair  $i, j$  in  $\mathcal{I}_1$ , one word  $w = w(i, j)$  connecting  $i$  to  $j$ . Notice there is such a word since  $\mathbf{A}$  is irreducible. We denote by  $P_0$  the length of the longest of such connecting words.

Then, there is a finite set  $\mathcal{A} \subset \mathbb{N}$  such that  $\mathbf{A}|_{\mathcal{A} \times \mathcal{A}}$  is irreducible and

$$\alpha(f) = \sup_{\mu \in \mathcal{M}_\sigma(\Sigma_{\mathbf{A}}(\mathcal{A}))} \int f d\mu.$$

Furthermore, if  $\nu$  is a maximizing measure, then

$$\text{supp } \nu \subset \mathcal{M}_\sigma(\Sigma_{\mathbf{A}}(\mathcal{A})).$$

If we consider the alphabet  $\mathcal{I}_1 := \{0, 1, \dots, l_1 - 1\}$  we still have a problem that maybe there are no allowable sequences only with such symbols and, besides, the shift does not need to be irreducible when restrict to such sequences. So we complete  $\mathcal{I}_1$  to a finite alphabet  $\mathcal{A}_1$  in the following manner:

Key Fact (again): The invariant measures supported in periodic orbits are dense on the set of ergodic measures.

$$\alpha(f) = \sup_{\mu \in \mathcal{M}_{\sigma\text{-Per}}(\Sigma_{\mathbf{A}}(\mathbb{N}))} \int f \, d\mu.$$

Proof:

The Ergodic Decomposition theorem implies that

$$\alpha(f) = \sup_{\mu \in \mathcal{M}_{\sigma\text{-erg}}(\Sigma_{\mathbf{A}}(\mathbb{N}))} \int f \, d\mu,$$

where  $\mathcal{M}_{\sigma\text{-erg}}(\Sigma_{\mathbf{A}}(\mathbb{N}))$  is the set of ergodic invariant probability measures and use the density of invariant measures supported in periodic orbits on the set of ergodic measures.

Key Fact (again): The invariant measures supported in periodic orbits are dense on the set of ergodic measures.

$$\alpha(f) = \sup_{\mu \in \mathcal{M}_{\sigma\text{-Per}}(\Sigma_{\mathbf{A}}(\mathbb{N}))} \int f \, d\mu.$$

Proof:

where  $\mathcal{M}_{\sigma\text{-erg}}(\Sigma_{\mathbf{A}}(\mathbb{N}))$  is the set of ergodic invariant probability measures and use the density of invariant measures supported in periodic orbits on the set of ergodic measures.

Key Fact (again): The invariant measures supported in periodic orbits are dense on the set of ergodic measures.

$$\alpha(f) = \sup_{\mu \in \mathcal{M}_{\sigma-Per}(\Sigma_{\mathbf{A}}(\mathbb{N}))} \int f d\mu.$$

Proof:

The Ergodic Decomposition theorem implies that

$$\alpha(f) = \sup_{\mu \in \mathcal{M}_{\sigma-erg}(\Sigma_{\mathbf{A}}(\mathbb{N}))} \int f d\mu,$$

where  $\mathcal{M}_{\sigma-erg}(\Sigma_{\mathbf{A}}(\mathbb{N}))$  is the set of ergodic invariant probability measures and use the density of invariant measures supported in periodic orbits on the set of ergodic measures.

## Naive idea:

Since the potential  $f$  decays to  $-\infty$  when the symbols grow, we can restrict ourselves to periodic orbits whose symbols are all small.

### Lemma

*Given  $\epsilon > 0$ , there is  $l_1 \in \mathbb{N}$  such that if  $x$  starts in  $i \geq l_1$  then  $\beta_m(x) := \frac{1}{m} S_m f(x) = \frac{1}{m} \sum_{j=0}^{m-1} f(\sigma^j(x)) < \alpha(f) - \epsilon$  for any  $m \in \mathbb{N}$ .*

In particular, if  $x \in \text{Per}(\sigma)$  we have  $\beta(x) < \alpha(f) - \epsilon$ .

### Lemma

*Given  $\epsilon > 0$ , there is  $l_1 \in \mathbb{N}$  such that if  $x$  starts in  $i \geq l_1$  then  $\beta_m(x) := \frac{1}{m} S_m f(x) = \frac{1}{m} \sum_{j=0}^{m-1} f(\sigma^j(x)) < \alpha(f) - \epsilon$  for any  $m \in \mathbb{N}$ .*

In particular, if  $x \in \text{Per}(\sigma)$  we have  $\beta(x) < \alpha(f) - \epsilon$ .

Proof: Since  $f$  is coercive, there is  $l_1 \in \mathbb{N}$  such that

$$\sup f|_{[j]} < \alpha(f) - \epsilon \quad \text{for all } j \geq l_1.$$

We have that

$$\beta_m(x) = \frac{1}{m} S_m f(x) = \frac{1}{m} \sum_{j=0}^{m-1} f(\sigma^j(x)) \leq \frac{1}{m} \sum_{j=0}^{m-1} \sup f|_{[\pi(\sigma^j(x))]},$$

since  $\pi(\sigma^j(x)) \geq i \geq l_1$  for all  $j = 0, \dots, m-1$ , we get

$$\beta_m(x) \leq \frac{1}{m} \sum_{j=0}^{m-1} \sup f|_{[\pi(\sigma^j(x))]} < \alpha(f) - \epsilon.$$

□

Proof: Since  $f$  is coercive, there is  $l_1 \in \mathbb{N}$  such that

$$\sup f|_{[j]} < \alpha(f) - \epsilon \quad \text{for all } j \geq l_1.$$

We have that

$$\beta_m(x) = \frac{1}{m} S_m f(x) = \frac{1}{m} \sum_{j=0}^{m-1} f(\sigma^j(x)) \leq \frac{1}{m} \sum_{j=0}^{m-1} \sup f|_{[\pi(\sigma^j(x))]},$$

since  $\pi(\sigma^j(x)) \geq i \geq l_1$  for all  $j = 0, \dots, m-1$ , we get

$$\beta_m(x) \leq \frac{1}{m} \sum_{j=0}^{m-1} \sup f|_{[\pi(\sigma^j(x))]} < \alpha(f) - \epsilon.$$

□

Proof: Since  $f$  is coercive, there is  $l_1 \in \mathbb{N}$  such that

$$\sup f|_{[j]} < \alpha(f) - \epsilon \quad \text{for all } j \geq l_1.$$

We have that

$$\beta_m(x) = \frac{1}{m} S_m f(x) = \frac{1}{m} \sum_{j=0}^{m-1} f(\sigma^j(x)) \leq \frac{1}{m} \sum_{j=0}^{m-1} \sup f|_{[\pi(\sigma^j(x))]},$$

since  $\pi(\sigma^j(x)) \geq i \geq l_1$  for all  $j = 0, \dots, m-1$ , we get

$$\beta_m(x) \leq \frac{1}{m} \sum_{j=0}^{m-1} \sup f|_{[\pi(\sigma^j(x))]} < \alpha(f) - \epsilon.$$

Let  $x \in \Sigma_{\mathbf{A}}(\mathbb{N})$  and  $w = x_\ell \dots x_{\ell+m}$  be a word appearing on  $x$ .

### Definition

- ① The average of the word  $w = x_\ell \dots x_{\ell+m}$  on the orbit  $x$  is

$$\kappa(\ell, m|x) = \kappa(w|x) := \frac{1}{m+1} \sum_{j=0}^m f(\sigma^{\ell+j}(x));$$

- ② if  $r < m$  we define

$$\kappa_r(\ell, m|x) := \frac{1}{r+2} \left[ f(\sigma^{\ell+m}(x)) + \sum_{j=0}^r f(\sigma^{\ell+j}(x)) \right].$$

### Fact 1:

Let  $x \in \Sigma_{\mathbf{A}}(\mathbb{N})$  be a periodic orbit for  $\sigma$  such that  $\beta(x) \geq \beta_f - \epsilon$  and  $x \notin \Sigma_{\mathbf{A}}(\mathcal{A}_2)$ .

Then, there is at least one word  $x_\ell \dots x_{\ell+m}$  appearing in  $x$  such that

- 1  $\kappa(\ell, m|x) \geq \beta(x)$ ;
- 2  $x_\ell < l_1$ ,  $x_{\ell+m} \geq l_2$ ; and
- 3  $x_{\ell+j} < l_2$  for all  $j \in \{0, \dots, m-1\}$ .

## Fact 2:

Let  $x_\ell \dots x_{\ell+m}$  be the word given by fact 1 and  $r < m$  be the greatest integer such that  $x_{\ell+r} \in \mathcal{I}_1$ . Then

$$\kappa(\ell, m|x) \leq \kappa_r(\ell, m|x).$$

The Theorem is consequence of the following result:

### Lemma

*Let  $x \in \Sigma_{\mathbf{A}}(\mathbb{N})$  be any periodic orbit for  $\sigma$  such that  $x \notin \Sigma_{\mathbf{A}}(\mathcal{A}_2)$  and  $\beta(x) \geq \alpha(f) - \epsilon$ . Then, there is a periodic orbit  $z \in \Sigma_{\mathbf{A}}(\mathcal{A}_2)$  such that  $\beta(z) > \beta(x)$ .*

## Theorem

Let  $\sigma$  be the full shift on  $\Sigma(\mathbb{R}^+)$  and  $f : \Sigma(\mathbb{R}^+) \rightarrow \mathbb{R}$  be a bounded above function with bounded variation. Given  $\epsilon > 0$  assume there are real numbers  $l_2 > l_1 > 0$  such that

$$\sup f|_{[j]} < \alpha(f) - \epsilon \quad \forall j \geq l_1,$$

for some  $\epsilon > 0$  fixed and

$$\sup f|_{[j]} < \min f|_{\Sigma([0, l_1])} - V(f) \quad \forall j \geq l_2.$$

Then, we have that

$$\alpha(f) = \sup_{\mu \in \mathcal{M}_\sigma(\Sigma([0, l_2]))} \int f \, d\mu.$$

Furthermore, if  $\nu$  is a maximizing measure, then

$$\text{supp } \nu \subset \mathcal{M}_\sigma(\Sigma([0, l_2])).$$

In the case that  $f$  is coercive, we have the following:

### Corollary

Let  $\sigma$  be the full shift on  $\Sigma(\mathbb{R}^+)$  and  $f : \Sigma(\mathbb{R}^+) \rightarrow \mathbb{R}$  be a bounded above function with bounded variation and coercive. Then, there is  $l > 0$  such that

$$\alpha(f) = \sup_{\mu \in \mathcal{M}_\sigma(\Sigma([0, l]))} \int f \, d\mu.$$

Furthermore, if  $\nu$  is a maximizing measure, then

$$\text{supp } \nu \subset \mathcal{M}_\sigma(\Sigma([0, l])).$$
