Remote

Satellites

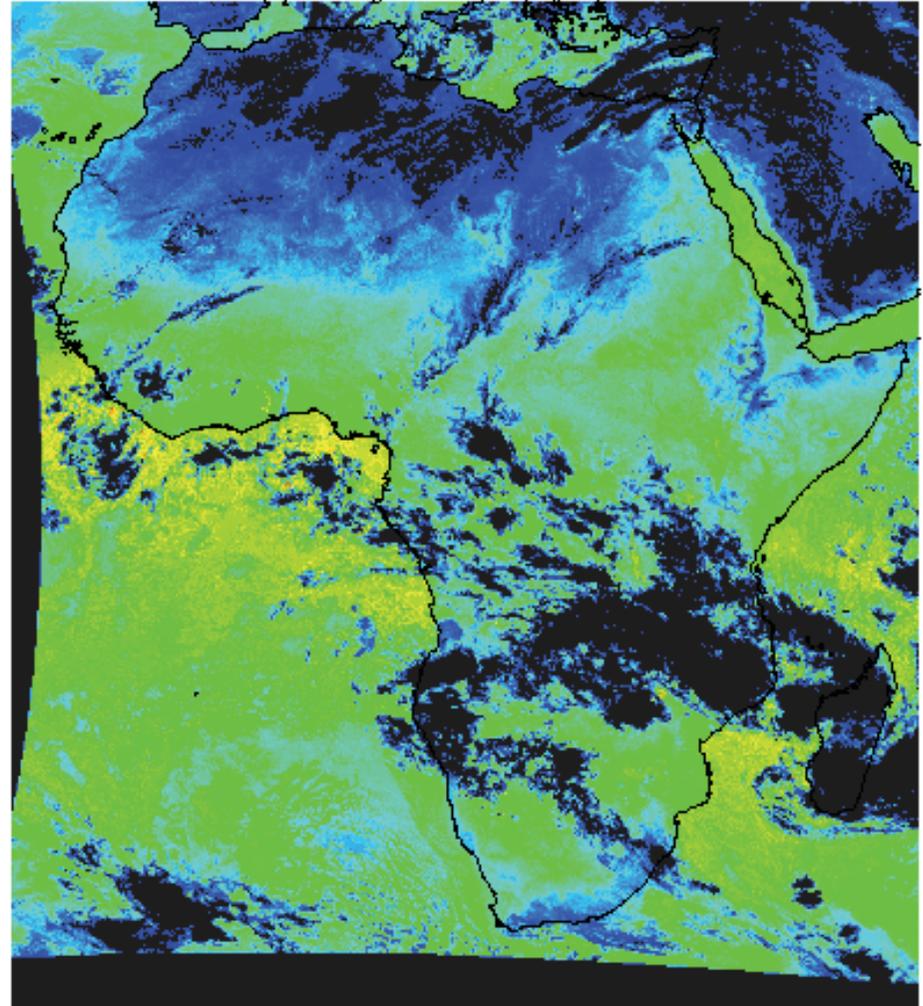

Geostationary or Polar-Orbiting Satellites

Geostationary Satellites

- Located at about 35,800 km above the equator
- Orbit at the same speed as earth's rotation
- Repeat coverage about 15 to 30 minutes
- Cover full earth disk
- Observes events and their evolution

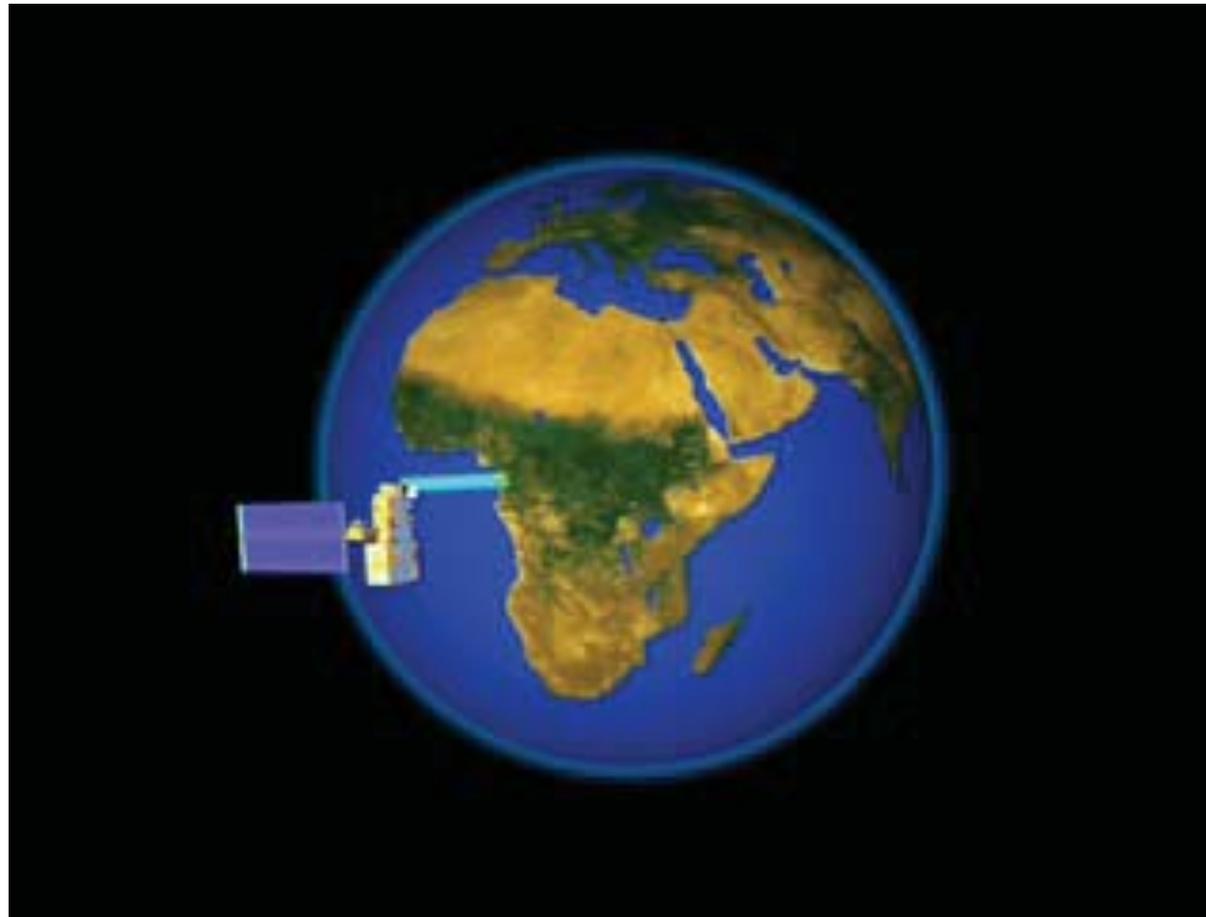

0000 1 Jan 2005

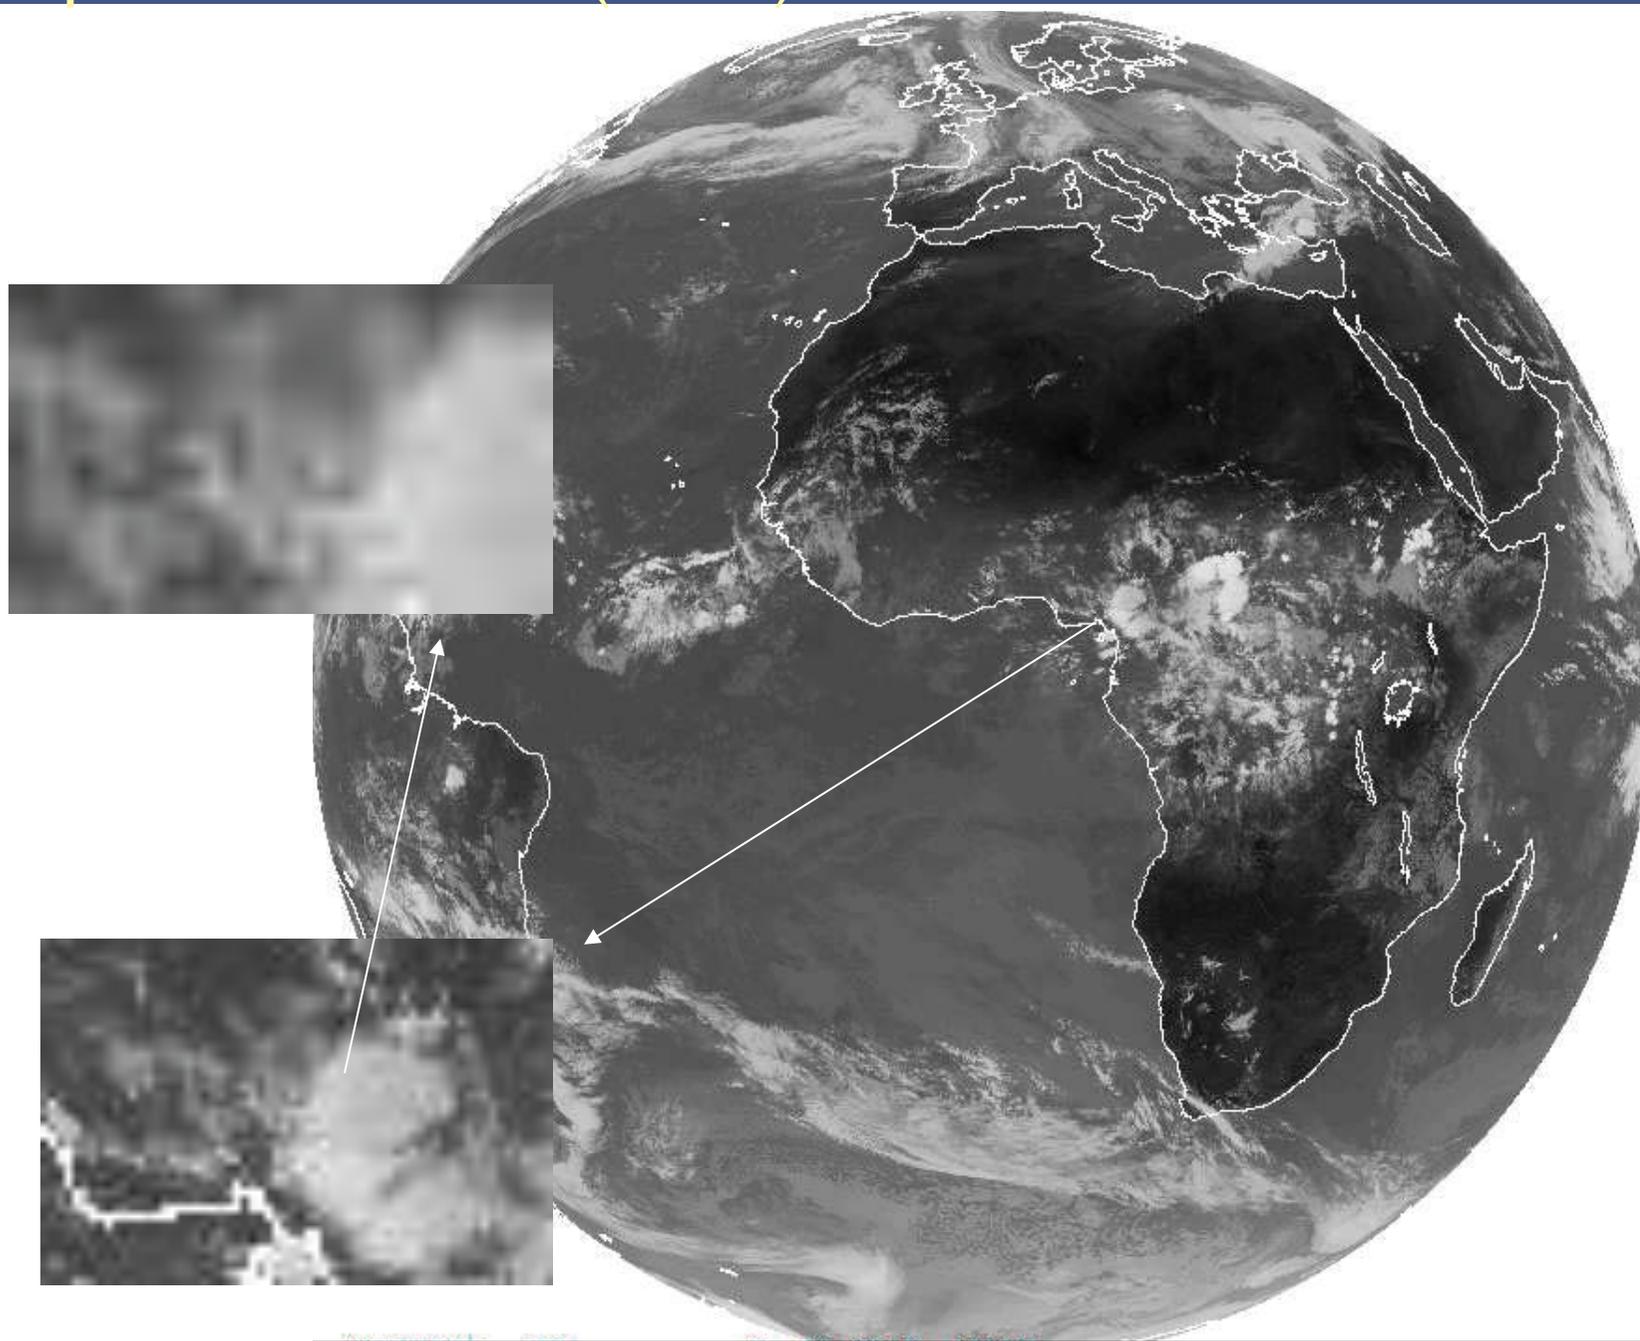

Polar-Orbiting Satellites

- 350 to 1000 km height
- Narrow spatial coverage
- Less frequent observations

<http://eyes.jpl.nasa.gov/earth/>

Spatial Resolution (5 Km)

Spatial Resolution (1 Km)

Spatial Resolution (30 m)

Geostationary Satellites

- Located at about 35,800 km above the equator
- Visible, NIR and Thermal Infrared
- Repeat coverage about 15 to 30 minutes
- Observes events and their evolution

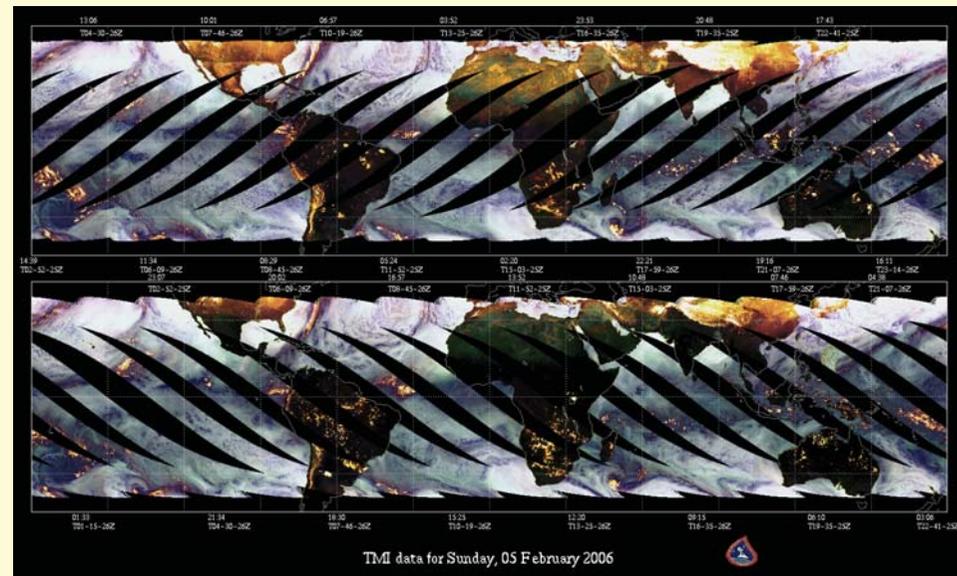

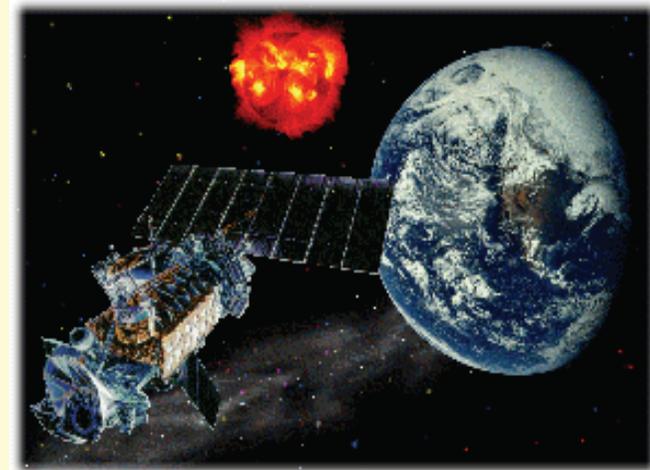

Polar-Orbiting Satellites Passive Microwave

Defense Meteorological Satellite Program (DMSP)

Special Sensor Microwave/Imager (SSM/I)

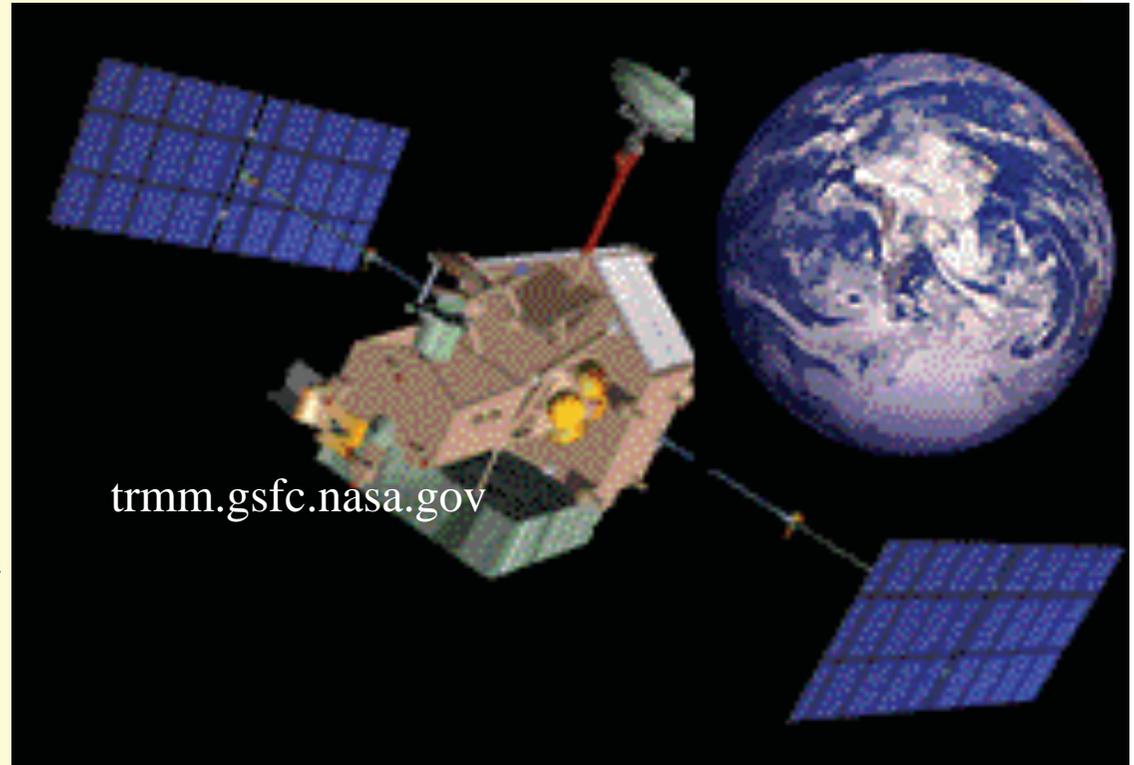

- Swath width: 1400-km
- Seven passive MW channels

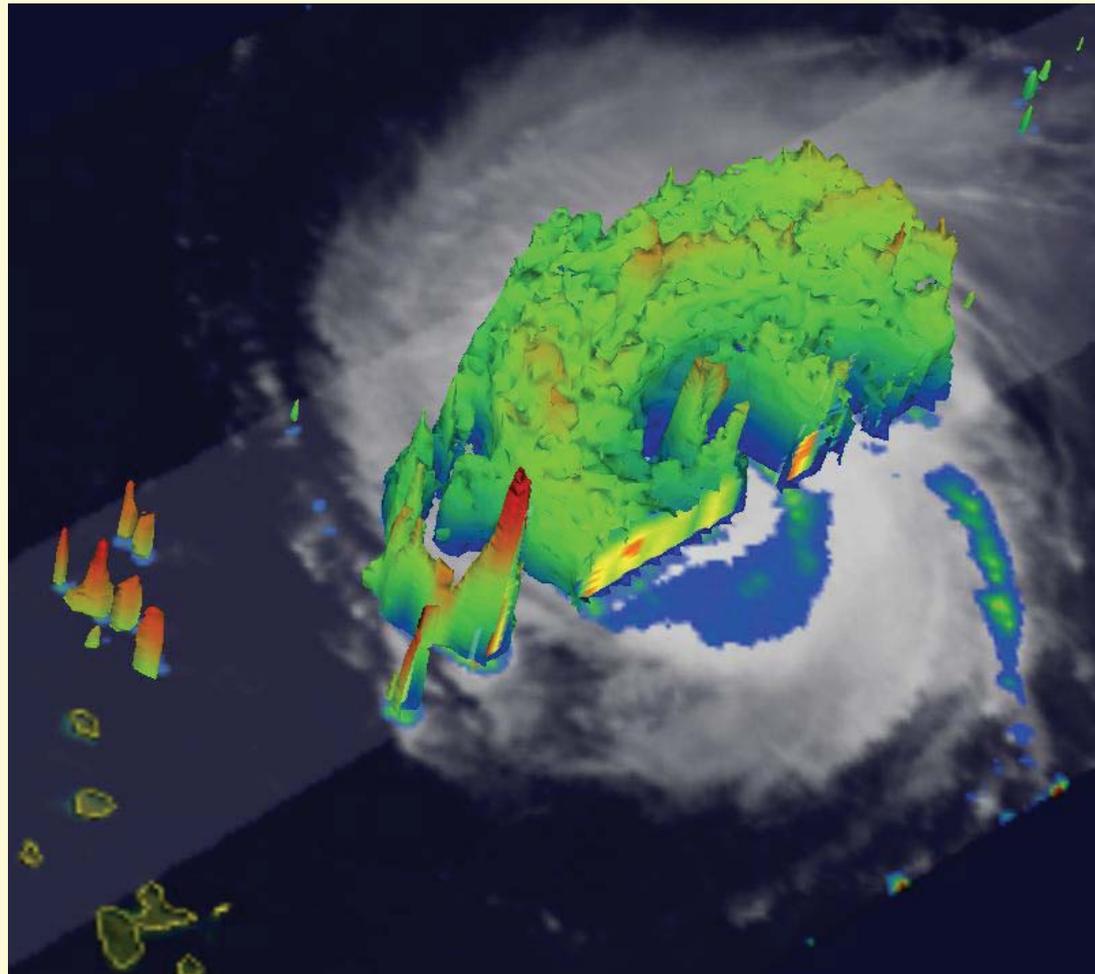

Radar and Passive Microwave on-board Satellites

Tropical Rainfall Measurement Mission (TRMM)

- **Precipitation radar (PR)**
 - **215 km Swath**
 - **250 m vertical resolution**
- **TMI**
 - **9-channel MW**
 - **760 km swath**
- **VV/IR**
- **Lightning detector**

TRMM product

Rainfall Estimates

Combines the best features of both approaches:

- Good *space/time resolution* of geostationary estimates
- Better *accuracy* of microwave estimates

Rainfall Products available on IRIS Web Site

http://iris.ccnmtl.columbia.edu/myresearch/rainfall_2.html

The screenshot shows the IRIS website interface. At the top, the IRIS logo is displayed with the tagline "Bringing Remote Sensing Data Down to Earth". Navigation links for "Introduction", "Help", and "Credits" are visible. Below the header, a "Modules" section includes "Fire", "Malaria", and "My Research". The "My Research Module" is selected, and the "Rainfall" sub-module is highlighted. A sidebar on the left lists navigation options: "Introduction", "Identify the Problem", "Find Data Sources" (with sub-items "Rainfall", "Temperature", and "Vegetation"), "Analyze the Data", "Method", "Guidelines", and "Submission". The main content area features the heading "Rainfall" and a section titled "Global Precipitation Climatology Project (GPCP)".

Rainfall

Global Precipitation Climatology Project (GPCP)

GPCP combines the precipitation information available from each of several sources into a final merged product, taking advantage of the strengths of each data type. The microwave estimates are based on Special Sensor Microwave/Imager (SSM/I) data from the Defense Meteorological Satellite Program (DMSP, United States) satellites that fly in sun-synchronous low-earth orbits. The current products include global monthly 2.5o and daily 1o rainfall estimates. The monthly data extends from 1979 to current, while the daily product is from 1996 to present. Both products are made available with some time delay.

Validation of Rainfall Products

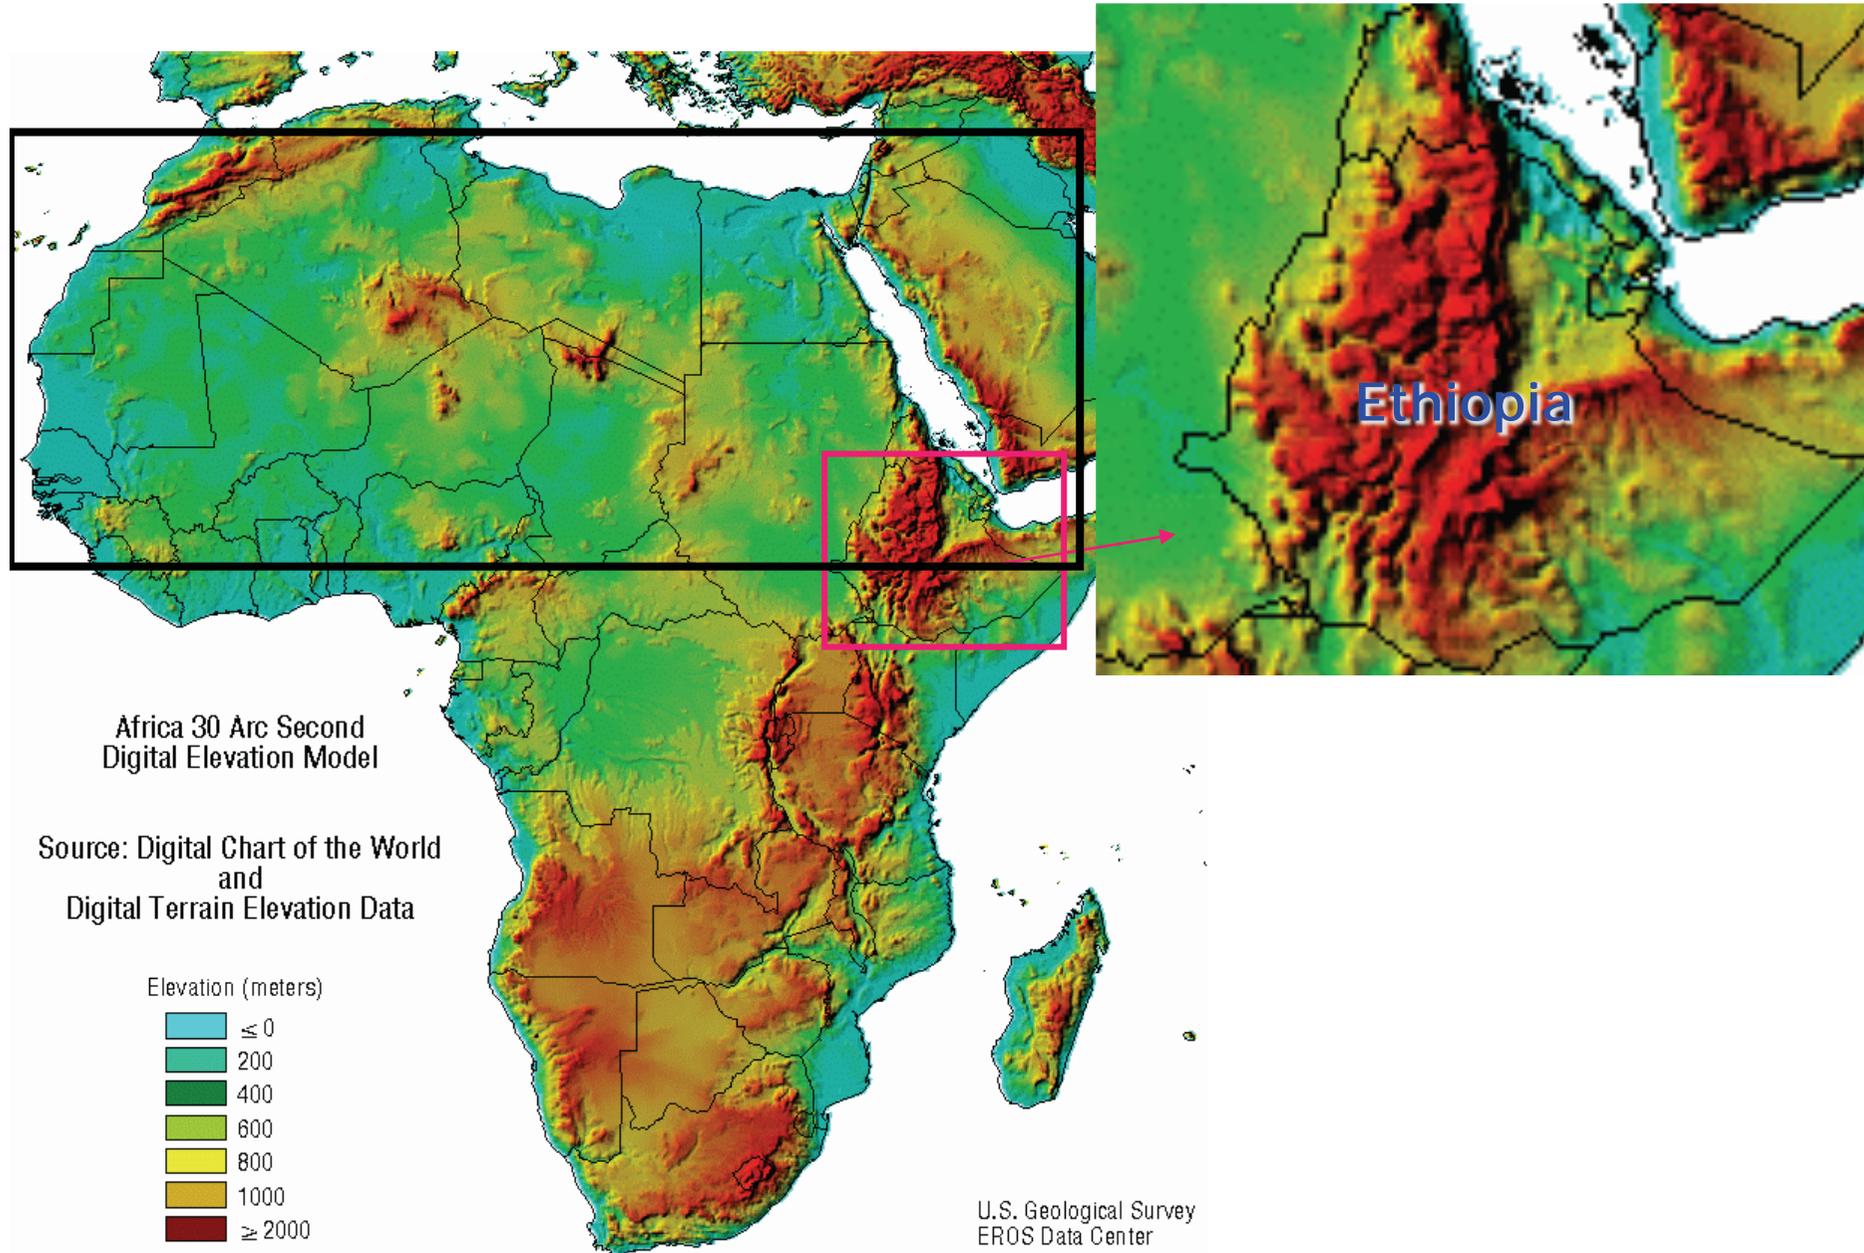

Validation:

Comparing Rainfall Estimates

with

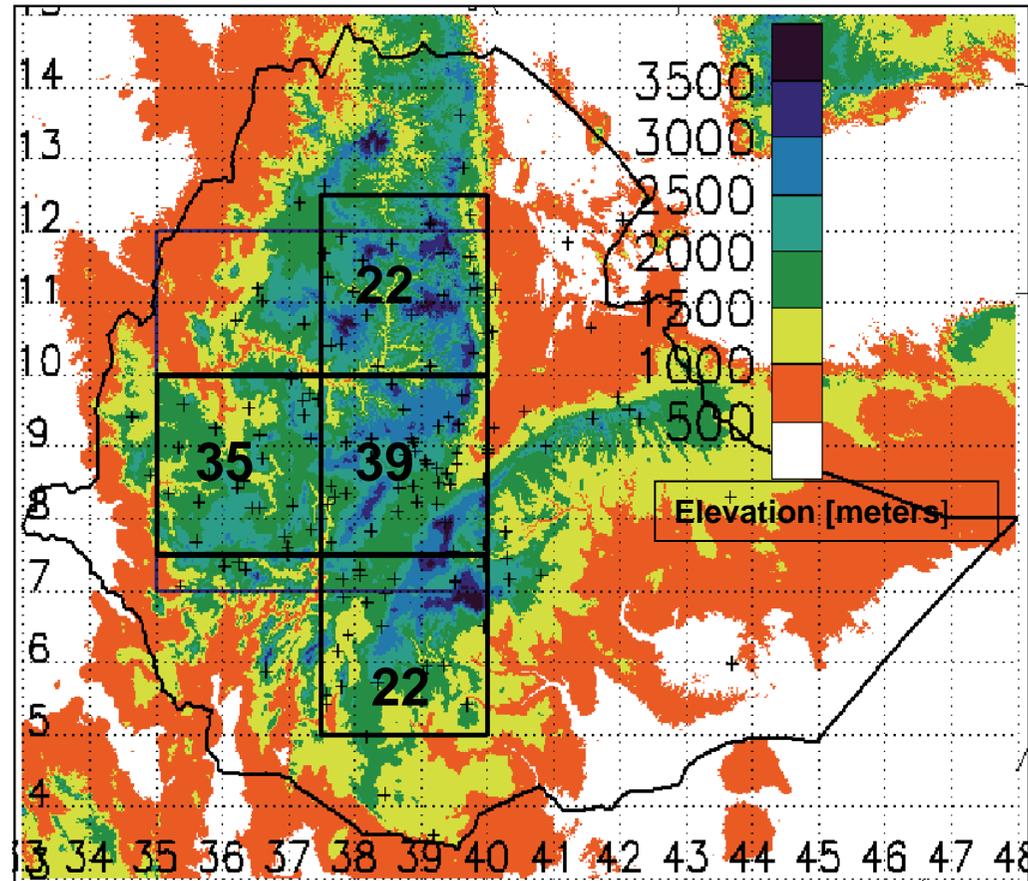

Rain Gauge Data

Validation of Rainfall Products

Validation of Rainfall Products

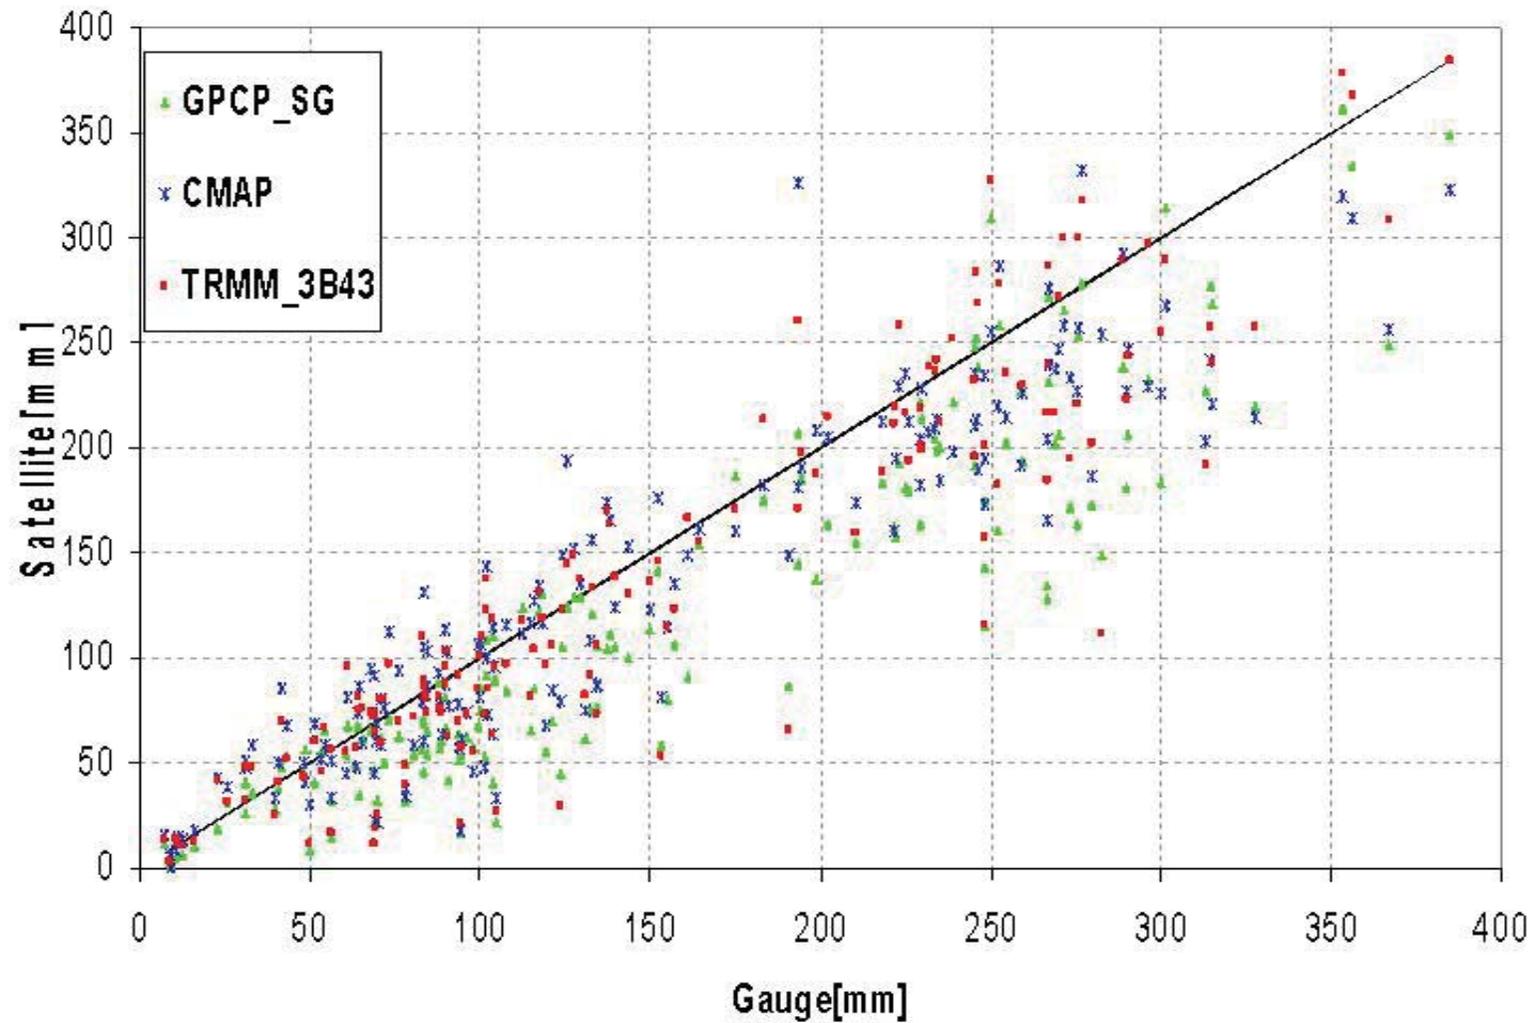

- 120 Stations used
- Gauge data gridded using Climate Aided Interpolation
- Kriging for interpolating the means

Topography and distribution of gauges. The four 2.5 degree boxes are used for at 2.5 degree resolution, and the number of gauges in each box is given. Stations in the larger box is used for validation at 1-degree resolution.

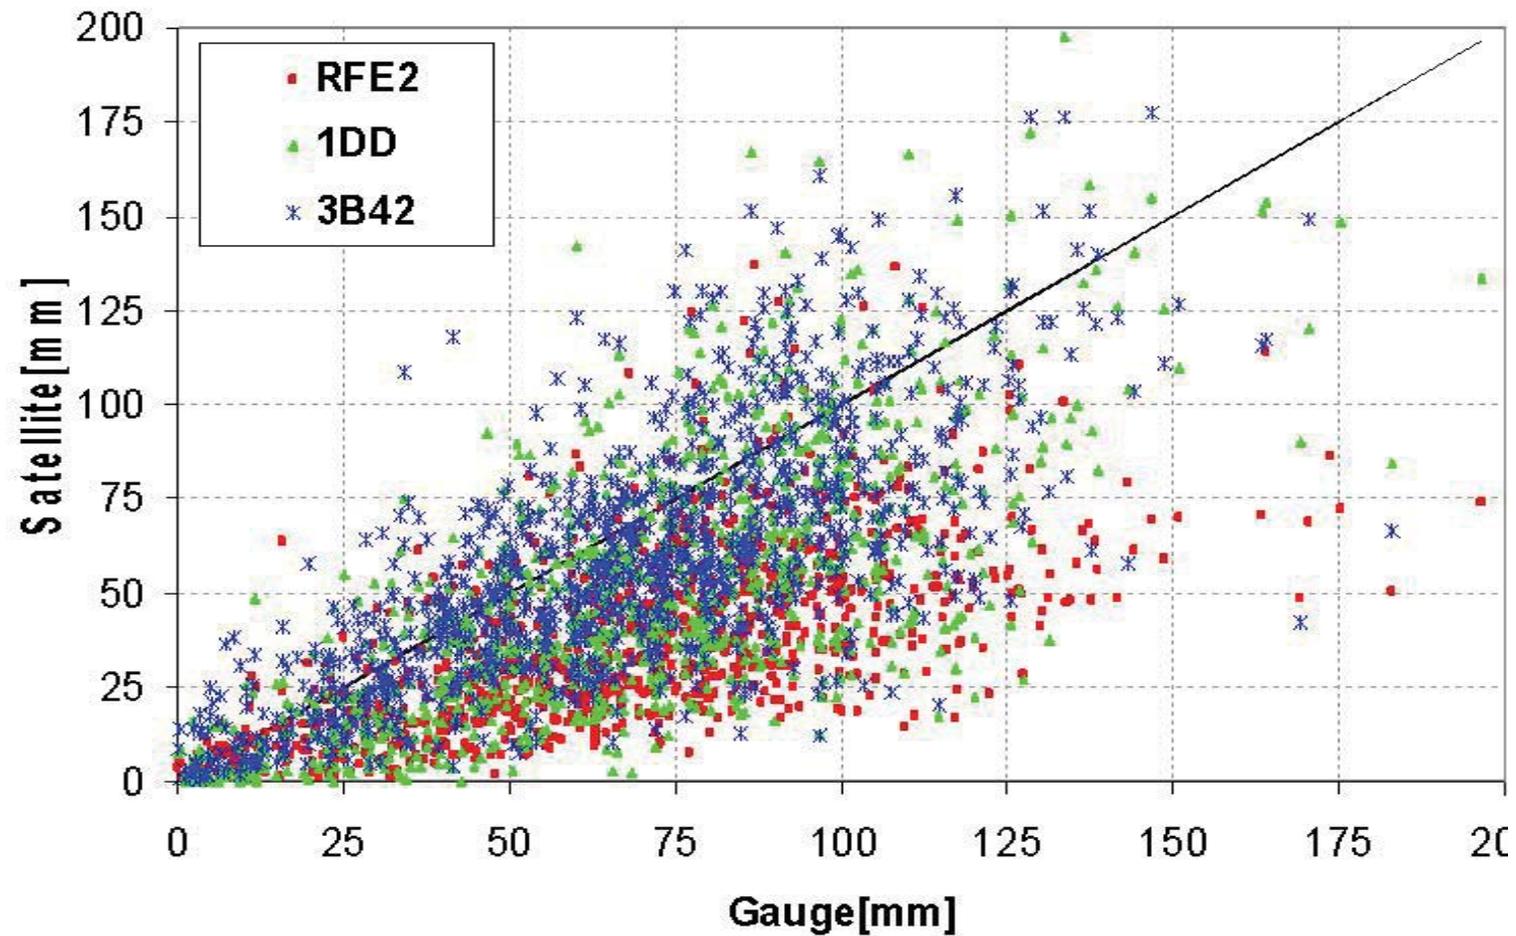

Validation of Rainfall Products

Monthly at 2.5-degree

Validation of Rainfall Products

10-day total at $1^\circ \times 1^\circ$

Comparison of CPC-RFE2, GPCP-1DD & TRMM-3B42

Validation of Rainfall Products

The following statistics were used to evaluate the accuracy of the rainfall estimate products to retrieve rainfall: coefficient of determination (R^2), mean error (ME), standard deviation (Stdv), root mean square error (RMSE), mean absolute error (MAE), and bias.

$$ME = \frac{1}{N} \sum (G - R)$$

$$RMSE = \sqrt{\frac{\sum (G - R)^2}{N}}$$

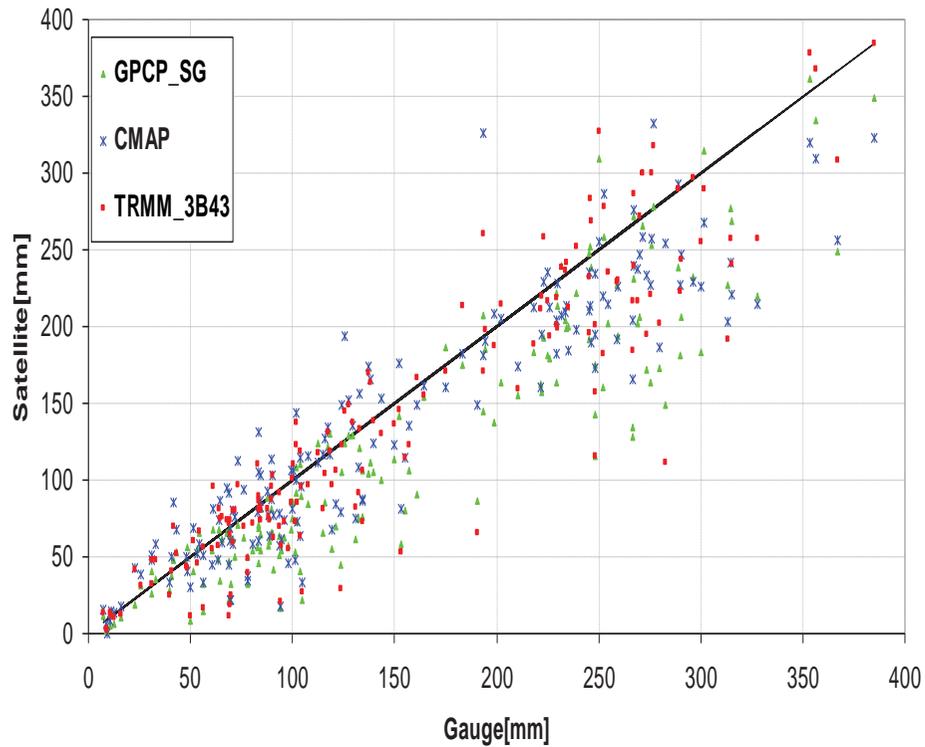

$$MAE = \frac{1}{N} \sum |(G - R)|$$

$$Bias = \frac{\sum G}{\sum R}$$

Where R = reference rain gauge observation, G = rainfall estimate product, and N = number of data pairs. ME and MAE are in mm while R^2 , Stdv, RMSE and Bias are unit-less.

Climate Analyses and Applications Map Room

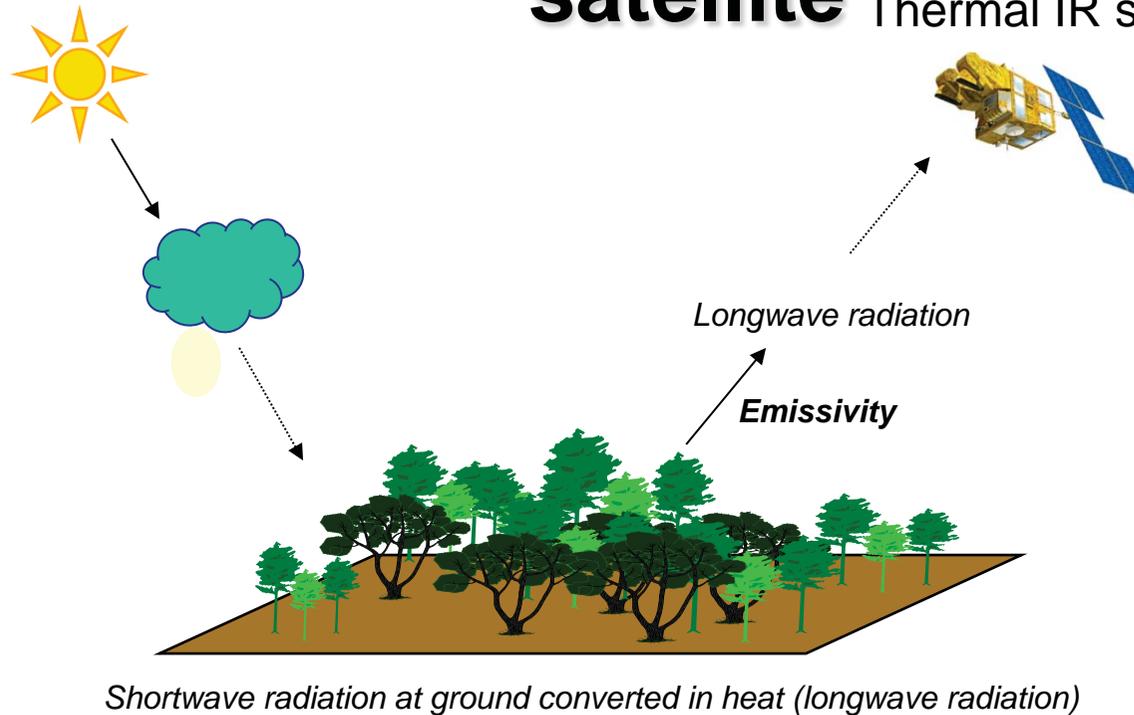

<http://www.ethiomet.gov.et/>

Climate Analysis	
	Rainfall and temperature time series (1983-2010) reconstructed from station observations and remote sensing proxies. This interface allows users to view rainfall, maximum and minimum temperature climatologies and anomalies.
Climate Monitoring	
	This is a rainfall-monitoring product based on dekadal rainfall. The interface allows users to view recent rainfall with a seasonal and recent historical perspective. Time series analyses of rainfall data are generated based on user-selected parameters.

Temperature

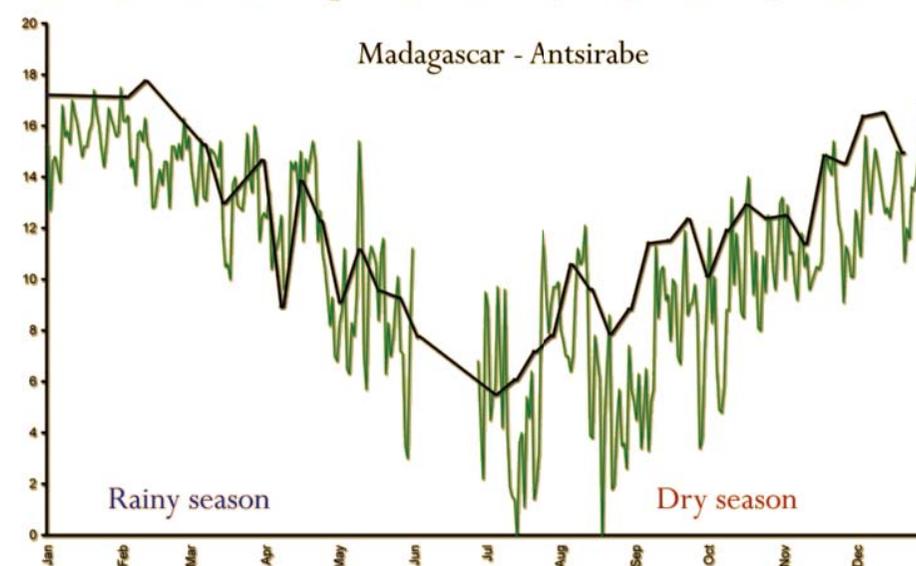

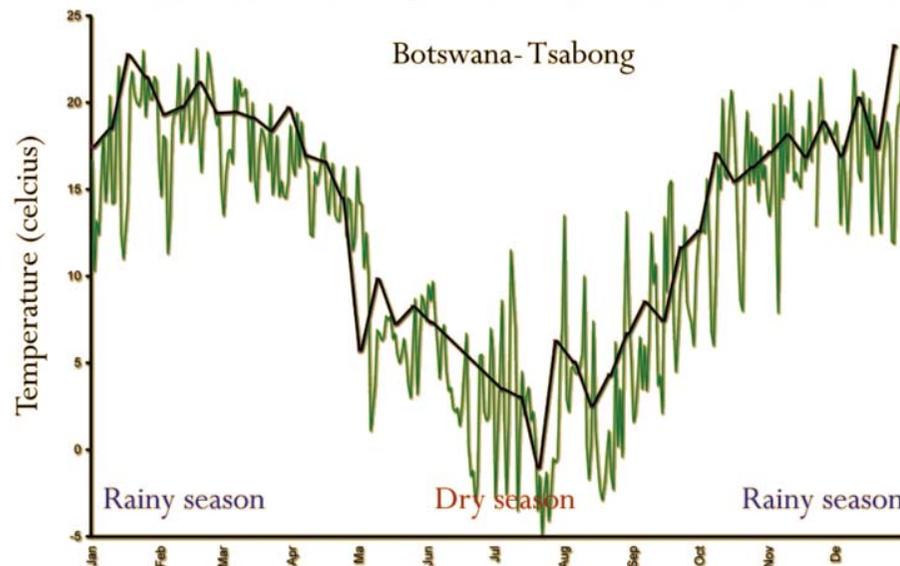

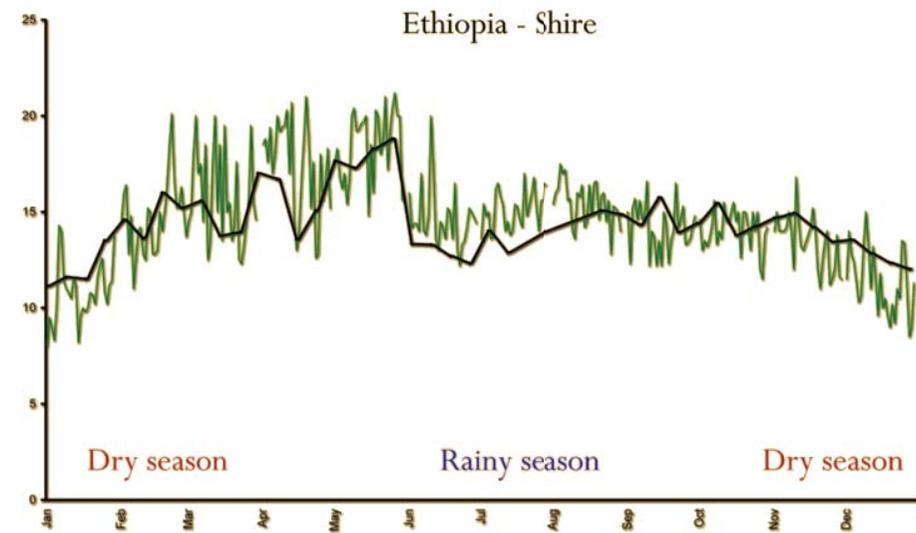

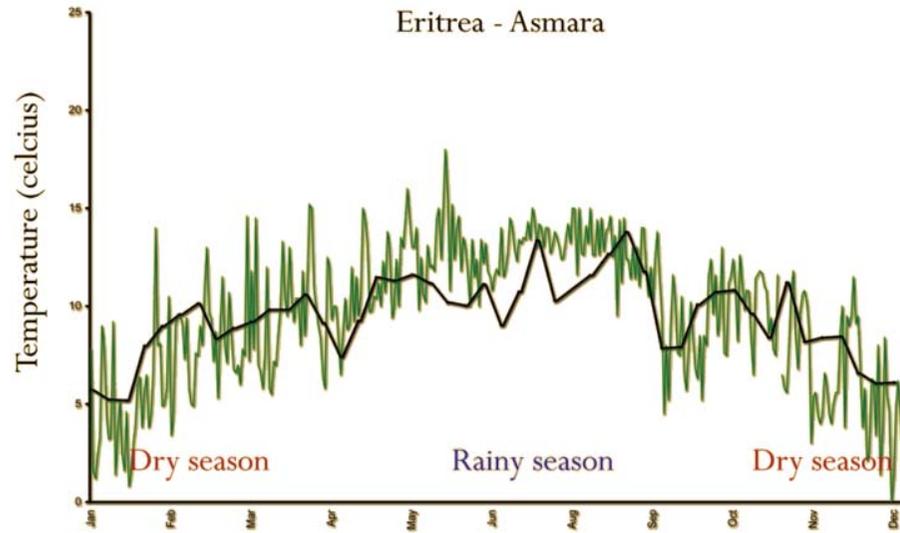

Land surface temperature retrieval from satellite Thermal IR sensors

Land surface (skin) temperature (LST) retrieval from thermal infrared sensors on board geostationary or polar orbiting satellites
