Introduction to QUANTUM ESPRESSO

P. Giannozzi

Università di Udine and IOM-Democritos, Trieste, Italy

Hands-on Tutorial on Electronic Structure Computations

ICTP Trieste, January 2013

The QUANTUM ESPRESSO distribution

QUANTUM ESPRESSO: *Quantum opEn-Source Package for Research in Electronic Structure, Simulation, and Optimization*, is an integrated software suite for first-principle simulations, using density-functional theory (DFT), a plane waves (PW) basis set and pseudopotentials (PP)

QUANTUM ESPRESSO is the result of a IOM-DEMOCRITOS initiative, in collaboration with several other institutions (ICTP, CINECA Bologna, EPF Lausanne, Princeton University, Paris VI, IJS Ljubljana,...)

The main goals of QUANTUM ESPRESSO are

- *innovation* in methods and algorithms
- *efficiency* on modern computer architectures

A great effort is also devoted to *user friendliness* and to the formation of a *users' and developers' community*

License

QUANTUM ESPRESSO is distributed under the *GNU (Gnu's Not Unix) General Public License (GPL)*, probably the most common free-software license (e.g.: the Linux Kernel). Basically:

- The source code is available.
- You can do whatever you want with the sources, but if you distribute any derived work, you have to distribute under the GPL the sources of the derived work.

Advantages:

- Everybody – including commercial entities – can contribute.
- Nobody can “steal” the code and give nothing back to the community.

QUANTUM ESPRESSO as a distribution

QUANTUM ESPRESSO is a *distribution* of packages, rather than a single monolithic tightly integrated package. The core distribution contains the two main packages:

- PWscf: self-consistent electronic structure, structural optimization, molecular dynamics on the electronic ground state
- CP: variable-cell Car-Parrinello molecular dynamics

They share a common installation method, input format, PP format, data output format, large parts of the basic code. Also included:

- PostProc: graphical and postprocessing utilities (band structure, density of states, STM maps, ...)

Packages

A set of packages, using routines from the core distribution, can be downloaded and installed on demand:

- PWGui: a Graphical User Interface for production of input files
- PHonon: linear-response calculations (phonons, dielectric properties)
- NEB: reaction pathways and barriers using Nudged Elastic Band
- atomic: atomic calculations, pseudopotential generation
- PWcond: ballistic conductance
- XSpectra: X-ray near-edge adsorption spectra (XANES) shifts
- TDDFPT: Time-Dependent Density-Functional Perturbation Theory

More packages

Packages covering more advanced features, separately maintained but still requiring routines from the core distribution:

- GIPAW: Gauge-Independent PAW for EPR and NMR chemical shift
- GWL: GW band structure with ultralocalized Wannier functions

A package that adds functionalities to QUANTUM ESPRESSO by patching it:

- PLUMED: plugin for metadynamics calculations

Plugins

Interoperable packages maintained by other groups that can be installed along with `QUANTUM ESPRESSO` and read its data file:

- `WanT`: Transport using maximally Localised Wannier functions
- `W90`: package for Maximally Localised Wannier functions
- `SaX`: electronic excitations from GW band structure
- `Yambo`: GW band structure, Bethe-Salpeter equations

Organization

Web site: <http://www.quantum-espresso.org>

Newsletter: pw_users@pwscf.org, (sparingly) used by developers for announcements about QUANTUM ESPRESSO

Mailing List: pw_forum@pwscf.org, for general discussions
(all subscribed users can post)

Developers' portal: QE-forge, an integrated developer environment, open to external contributions in the field of atomistic simulations:
<http://www.qe-forge.org>

The core distribution and packages is maintained in a single SVN tree. Available to everyone anytime via anonymous (read-only) access.

Developers' Mailing List: q-e-developers@qe-forge.org
(use this for technical questions or communications to developers)

<http://www.quantum-espresso.org>

QUANTUM ESPRESSO EVENTS 2013

Hands-on Tutorial on Electronic Structure Computations, ICTP Trieste, 14-18 January.

Workshop on Computer Programming and Advanced Tools for Scientific Research Work & Quantum ESPRESSO Developer Training, ICTP Trieste, 11-28 March

(more events are planned, stay tuned)

QUANTUM ESPRESSO

is an integrated suite of Open-Source computer codes for electronic-structure calculations and materials modeling at the nanoscale. It is based on density-functional theory, plane waves, and pseudopotentials.

What can QUANTUM ESPRESSO do?

- Structural modeling (equilibrium structures of molecules, crystals, surfaces)
- Dynamical modeling (first-principles molecular dynamics) either on the electronic ground state (Born-Oppenheimer) or with fictitious electronic kinetic energy (Car-Parrinello)
- Chemical reactivity and transition-path sampling, using Nudged Elastic Band (NEB) method
- Linear response functions (vibrational and dielectric properties), plus some non-linear ones (third-order force constants and dielectric response, non-resonant Raman)
- Computational microscopy (STM)

Advanced QUANTUM ESPRESSO capabilities

- Beyond simple DFT: DFT+U, nonlocal (vdW-DF), hybrid functionals (PBE0, B3LYP), meta-GGA
- Ballistic transport, transport with Wannier functions
- Free-energy sampling (metadynamics, with PLUMED plugin)
- Computational spectroscopy:
 - lattice and molecular vibrations: Raman, Infrared, Neutrons
 - magnons and spin excitations
 - photoemission (MBPT)
 - optical/UV absorption (TDDFT, MBPT soon to come)
 - NMR chemical shifts
 - X-ray spectra, core level shifts

Using PWscf

The main executable of PWscf is `pw.x`. It reads data from an input file:
e.g. `pw.x -inp input_file` having the following structure:

```
&NAMELIST1 ... /  
  
&NAMELIST2 ... /  
  
&NAMELIST3 ... /  
  
INPUT_CARD1  
.....  
.....  
INPUT_CARD2  
.....  
.....
```

NAMELISTS are a standard input construct in fortran90.

The use of **NAMELISTS** allows to specify the value of an input variable **only when it is needed** and to define **default values** for most variables that then need not be specified. Variable can be inserted **in any order**.

INPUT_CARDS are specific of ESPRESSO codes and are used to provide input data that are **always needed** and would be boring to specify with the `variable_name=variable_value` syntax used by NAMELIST.

INPUT_CARDS require data in specific order (which may depend on the situation and on the value of a **card_format_specifier**)

For instance:

```
INPUT_CARD  card_format_specifier  
data(1,1) data(1,2) data(1,3) ...  
data(2,1) data(2,2) data(2,3) ...  
data(3,1) data(3,2) data(3,3) ...  
... ..
```

Logically independent **INPUT_CARDS** can be given in any order

Namelists (1)

There are *three mandatory* NAMELISTS in PWscf:

&CONTROL input variables that control the flux of the calculation and the amount of I/O on disk and on the screen.

&SYSTEM input variables that specify the system under study.

&ELECTRONS input variables that control the algorithms used to reach the self-consistent solution of KS equations for the electrons.

Namelists (2)

Two additional NAMELISTS in PWscf *must* be specified under certain circumstances:

&IONS needed when ATOMS MOVE! IGNORED otherwise !
input variables that control ionic motion in
molecular dynamics run or structural relaxation

&CELL needed when CELL MOVES! IGNORED otherwise !
input variables that control the cell-shape
evolution in a variable-cell-shape MD or
structural relaxation

INPUT_CARDS (1)

There are *three mandatory* INPUT_CARDS in PWscf:

ATOMIC_SPECIES name, mass and pseudopotential used for
each atomic species present in the system

ATOMIC_POSITIONS type and coordinates of each atom in the
unit cell

K_POINTS coordinates and weights of the k-points
used for BZ integration

and a few more that must be specified *only* in some cases:

CELL_PARAMETERS

OCCUPATIONS

CONSTRAINTS (only for constrained dynamics)

A sample (and simple) input file

```
&control
  calculation = 'scf',
  prefix = 'Si_work',
  tprnfor = .false.,
  pseudo_dir = '.',
  outdir = '.'
/
&system
 ibrav = 2,
  celldm(1) = 10.0,
  nat = 2,
  ntyp = 1,
  ecutwfc = 15,
  nspin = 1,
/
&electrons
  mixing_beta = 0.7
/

ATOMIC_SPECIES
Si 28.086 Si.pbe-rrkj.UPF

ATOMIC_POSITIONS (alat)
Si 0.0 0.0 0.0
Si 0.25 0.25 0.25

K_POINTS (automatic)
3 3 3 1 1 1
```

Online input documentation
