## • Cavity Laser

## Ingredients:

- Gain Medium
- Cavity  
→ Feedback & Mode Selection

## • Random Laser

- Gain Medium
- **Multiple scattering**

*V.S. Letokhov, Sov. Phys. JETP **26**, 835-840 (1968)*

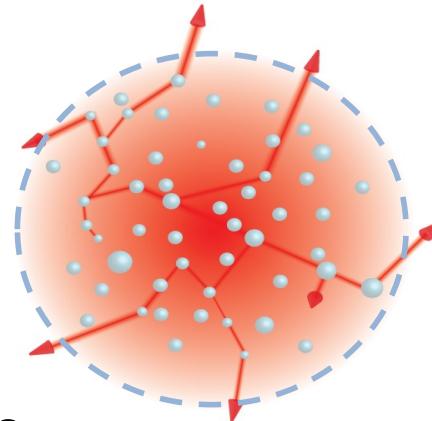

1939–2009

Pioneer in Laser physics : Basov  
(Nobel prize 1964, with C. Townes , Prokhorov)

## Main ingredient for a random laser :

**Gain in volume (  $\ell_g$  ) vs Losses at surface (via diffusion :  $\ell_{sc}$  )**

⇒ **Critical volume / mass : photonic bomb**

1) Diffusion equation with gain + boundary conditions

$$\frac{1}{c} \frac{\partial \Phi_\omega(\mathbf{r}, t)}{\partial t} = D \Delta \Phi_\omega(\mathbf{r}, t) + Q_\omega(\mathbf{r}, t) N_0 \Phi_\omega(\mathbf{r}, t)$$

2) Unfolded path longer than gain length

$$N \ell_{sc} > \ell_g$$

$$N \propto b^2 = (L/\ell_{sc})^2$$

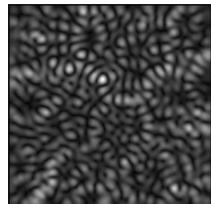

$$L^2 / \ell_{sc} > \ell_g$$

$$L > \sqrt{\ell_{sc} \ell_g}$$

# Theory of random lasers :

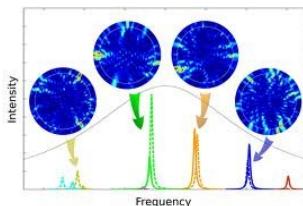

interface between  
**laser theory and multiple scattering and waves in random media**  
**(localisation)**

- Role of interferences (modes of passive system)

C. Vanneste P. Sebbah, H. Cao, PRL **98**, 143902 (2007)

- Mode coupling in multimode laser (Petermann factor)

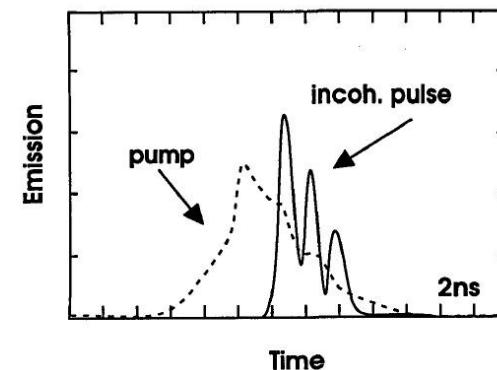

H. E. Tureci, Li Ge, S. Rotter, and A. D. Stone, Science **320**, 643 (2008).

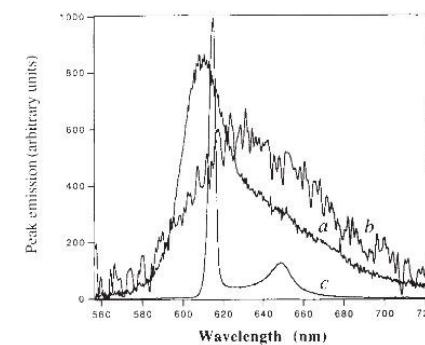

- + Spectral narrowing, photon statistics, role of ASE, superradiance, ...

## 4. Outlook

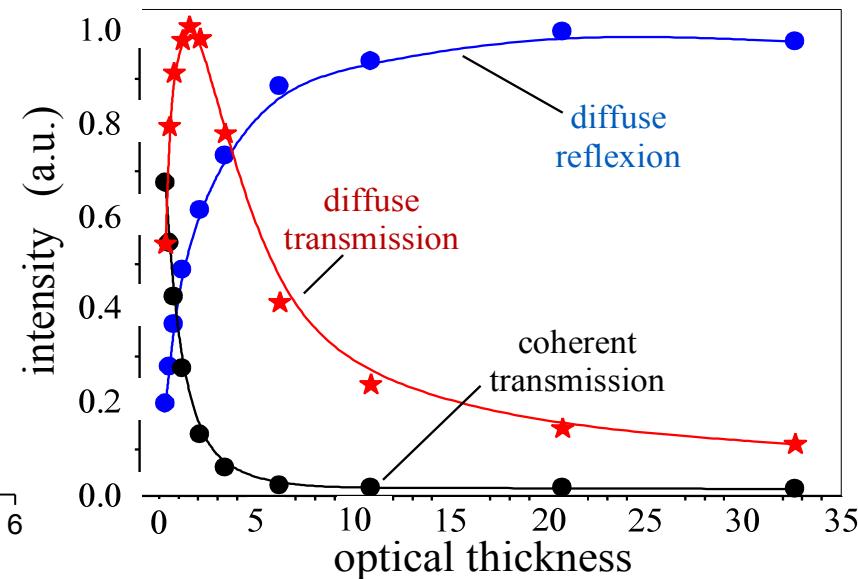

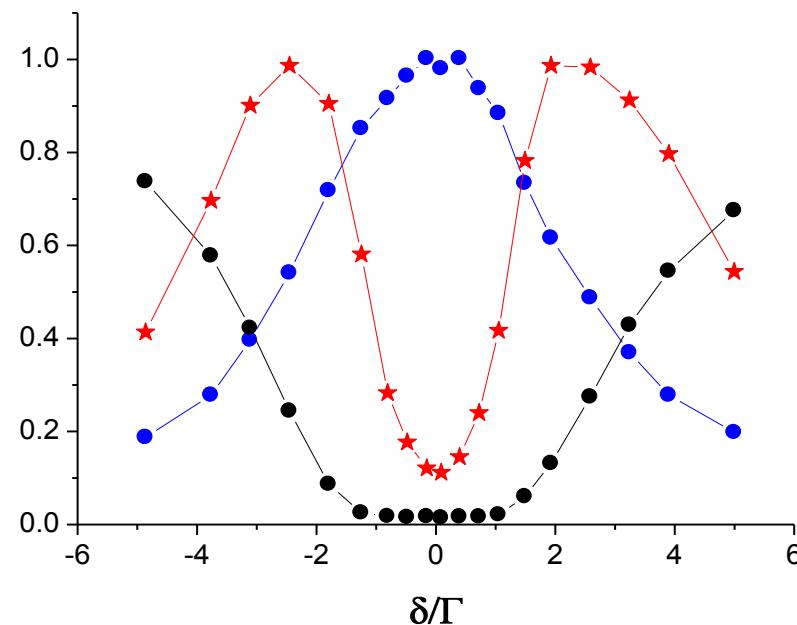

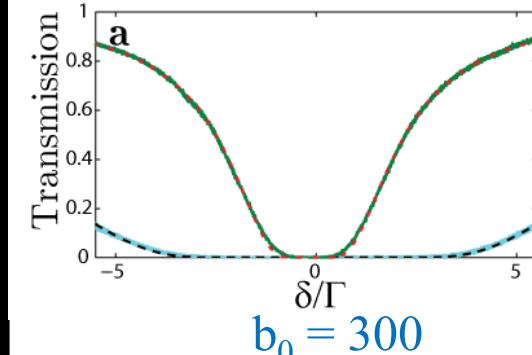

# Multiple Scattering of Light by Cold Atoms

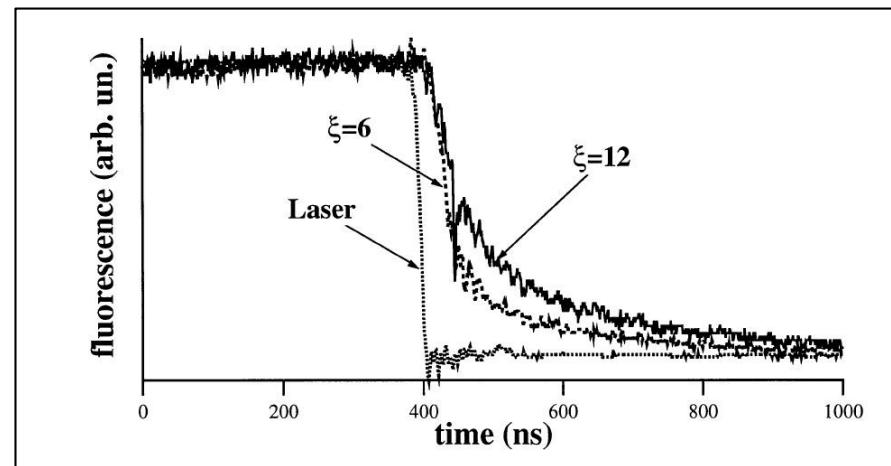

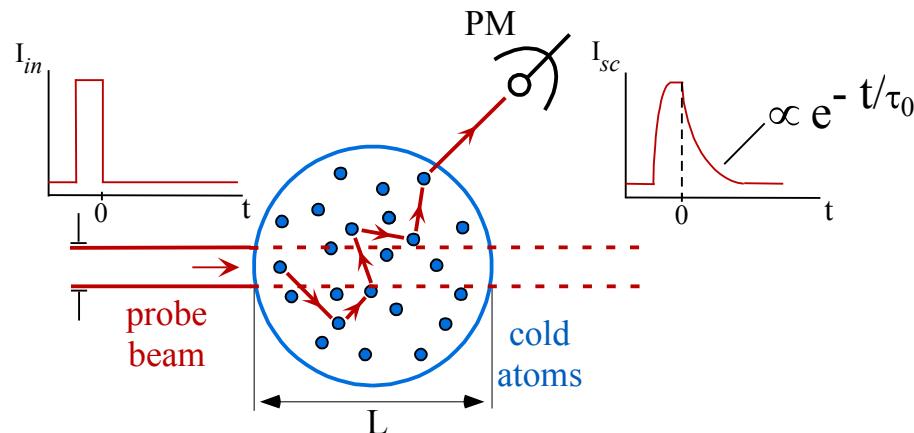

$$T = e^{-b} = e^{-\sigma n L} = e^{-L/\ell_{sc}}$$

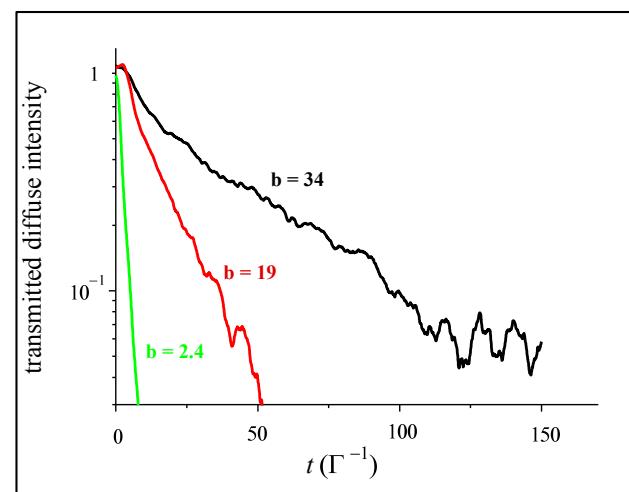

MOT parameters :  
 Atom number :  $N_{at} \sim 10^{10}$   
 Optical thickness  $b_0 = 300$   
 Density  $\sim 5 \cdot 10^{10}$  at/cc

# Time dependent experiments

A. Fioretti et al., Opt. Comm. **149**, 415 (1998)

$$D = \frac{1}{3} \frac{l_{tr}^2}{\tau_{tr}} \quad \begin{matrix} \text{transport mean-free} \\ \text{path} \end{matrix}$$

$$= \frac{1}{3} l_{tr} v_{tr} \quad \begin{matrix} \text{transport time} \\ \text{transport velocity} \end{matrix}$$

$v_{tr} \approx 3 \cdot 10^{-5} c$

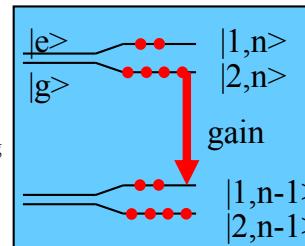

G. Labeyrie et al., PRL, **91**, 223904 (2003)

# Gain with Cold Atoms:

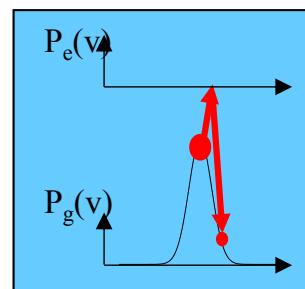

- Pump probe spectroscopy with cold atoms**

G. Grynberg, C. Robilliard, Phys. Rep. 355, 335 (2001)

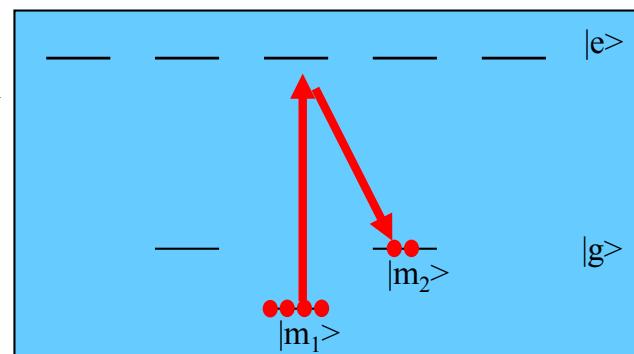

- Mollow gain** (used in ‘lasing without inversion’)  
 $\Rightarrow$  internal degree of freedom of 2 level system  
 $\Rightarrow$  excited/ground state population inversion :  $\pi_e > \pi_g$   
 $\Rightarrow$  requires high pump intensities

- Recoil induced resonances / Rayleigh gain**  
 (used in ‘Collective Atomic Recoil Laser’)  
 $\Rightarrow$  external degree of freedom (motion)  
 $\Rightarrow$  population inversion :  $\pi(v+dv) > \pi(v)$  (free moving atoms)  
 $\Rightarrow$  vibrational levels of ground population inversion :  $\pi_n > \pi_{n'}$   
 (atoms bound in lattice)  
 $\Rightarrow$  requires ultracold atoms

- Raman gain**  
 $\Rightarrow$  internal degree of freedom of multilevel system  
 $\Rightarrow$  population inversion :  $\pi_{g1} > \pi_{g2}$   
 $\Rightarrow$  large in cold atoms

- Four Wave Mixing**

  - Gain
3. Random lasing with cold atoms
  - Predictions
  - Experiments
  - Model
4. Outlook

- **Multiple Scattering of Light by Cold Atoms**

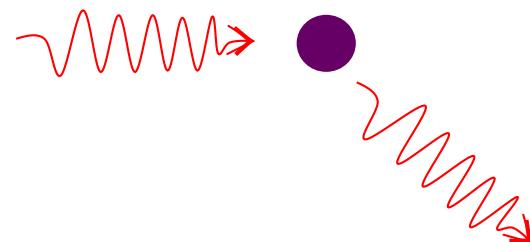

- **Lasing with Cold Atoms:**

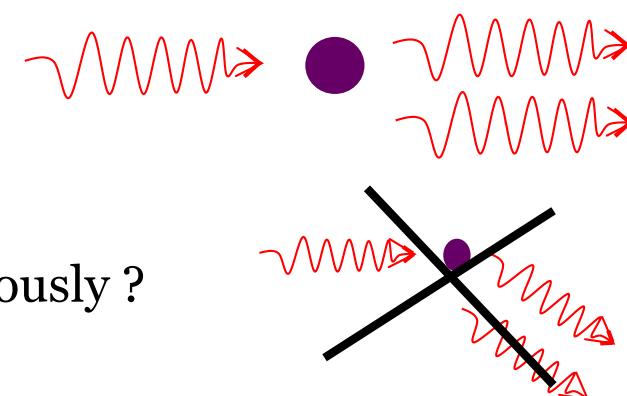

**How to combine these ingredients ?**

Problem : the scatterers and amplifiers are **the same atoms !**

Scattering

Gain

Is it possible to get both simultaneously ?

Pumping, necessary to get gain, reduces drastically the scattering cross-section ☹

## Letokhov **diffusive** model

$$L > 2\pi \sqrt{\frac{\ell_{\text{sc}} \ell_g}{3}}$$

(sphere geometry)

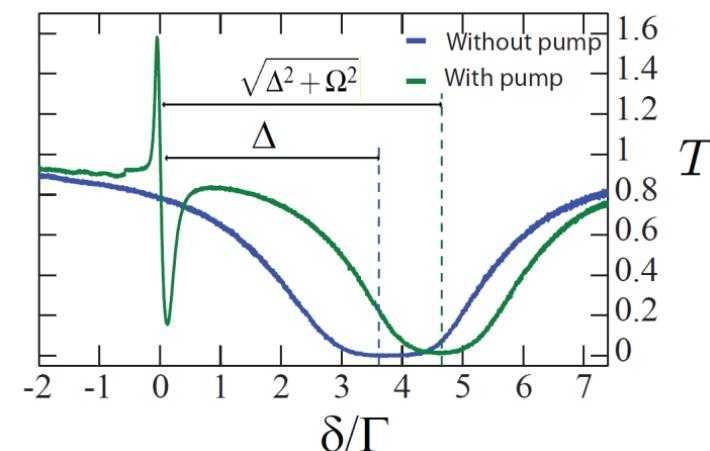

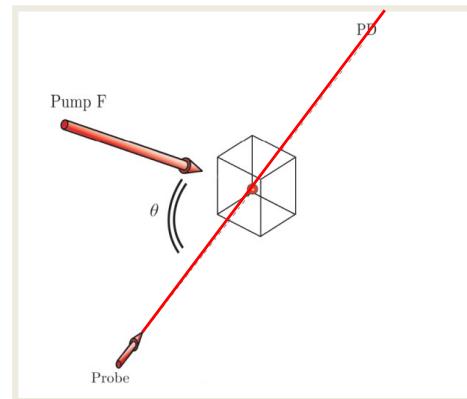

$\ell_g$  = linear gain length

$\ell_{\text{sc}}$  = mean free path  $\ell_{\text{sc}} = \frac{1}{n \sigma_{\text{sc}}}$

Transmission experiments:  $T = e^{-L/\ell_{\text{ex}}}$

with the extinction length

$$\frac{1}{\ell_{\text{ex}}} = \frac{1}{\ell_{\text{sc}}} - \frac{1}{\ell_g}$$

# The atomic polarizability

$$\sigma_{\text{ex}} = k \text{Im}(\alpha) = \sigma_0 \text{Im}(\tilde{\alpha})$$

$$\sigma_{\text{sc}} = \frac{k^4}{6\pi} |\alpha|^2 = \sigma_0 |\tilde{\alpha}|^2$$

$$\sigma_0 = \frac{3\lambda^2}{2\pi} = \frac{6\pi}{k^2} = \text{on-resonance atomic cross-section}$$

$$\alpha = \frac{\sigma_0}{k} |\tilde{\alpha}| = \text{polarizability} \quad (\text{with } \sim : \text{dimensionless})$$

$$L > 2\pi \sqrt{\frac{\ell_{\text{sc}} \ell_g}{3}}$$

$$\frac{1}{\ell_{\text{ex}}} = \frac{1}{\ell_{\text{sc}}} - \frac{1}{\ell_g}$$

$$\text{On-resonance optical depth : } b_0 = n \sigma_0 L$$

$$b_0 > \frac{2\pi}{\sqrt{3|\tilde{\alpha}|^2 (|\tilde{\alpha}|^2 - \text{Im}(\tilde{\alpha}))}}$$

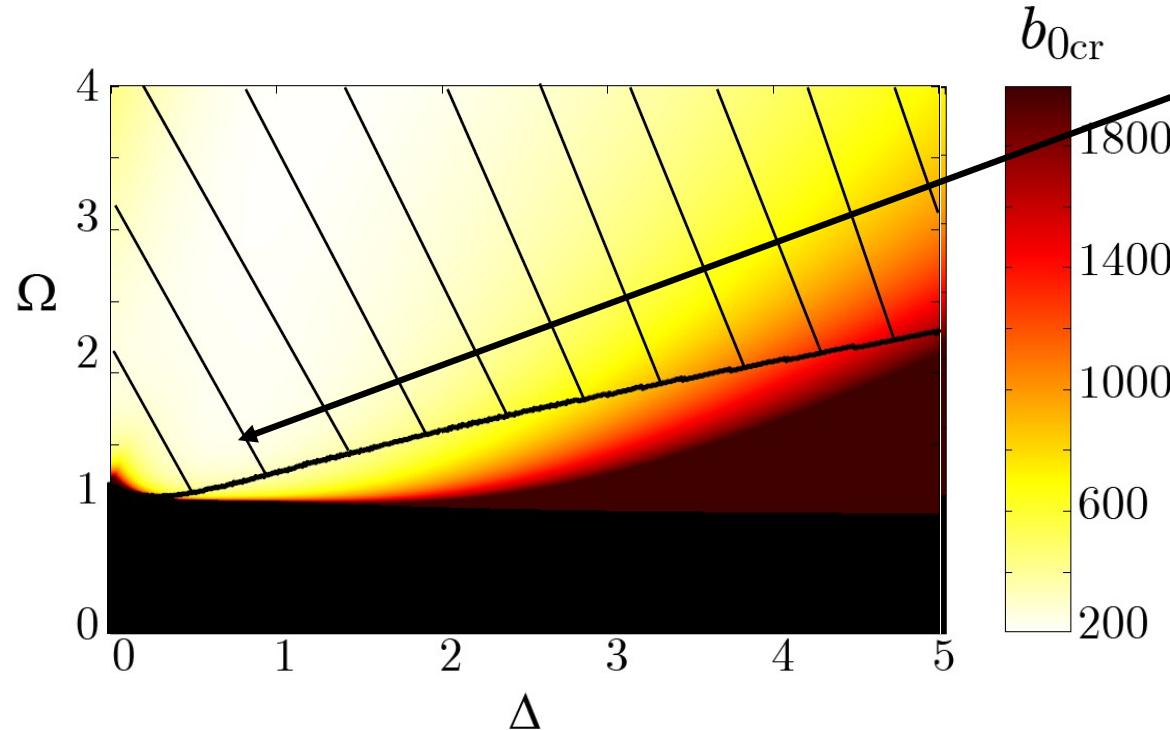

$\alpha$  depends on :

- Gain scheme
- Rabi frequency  $\Omega$  of the pump
- atom-pump detuning  $\Delta$
- detuning  $\delta$  from the pump

# Example : Mollow gain

$$\tilde{\alpha}(\Omega, \Delta, \delta) = -\frac{1}{2} \frac{1+4\Delta^2}{1+4\Delta^2+2\Omega^2} \times \frac{(\delta+i)(\delta-\Delta+i/2)-\Omega^2\delta/(2\Delta-i)}{(\delta+i)(\delta-\Delta+i/2)(\delta+\Delta+i/2)-\Omega^2(\delta+i/2)}$$

with  $\Omega, \Delta, \delta$  in unit of  $\Gamma$ .

The best :  
 $b_{0\text{cr}} \approx 200.$

Hard, but it's reached  
in some cold-atoms  
experiments.

- 1) A threshold exists !**
- 2) within reach ☺**
- 3) signature ?**

L.S. Froufe-Perez & al, PRL. **102**, 173903 (2009)

# Best choice of gain scheme ?

Gain mechanism	Evaluation method	$b_{0\text{cr}}$	Validity of the diffusion approx.	Other problem	Ref.
Mollow gain	Analytical $\alpha$	$\sim 200$	✗	Pump penetration ☹	[1]
NDFWM	Exp. & Num.	$\infty$	✓	Inelastic scattering ☹	
Raman gain (Zeeman)	Exp.	$\sim 200$	✗	Detection ☹	[2]
Raman gain (Hyperfine)	Num.	$\sim 90$	✗		

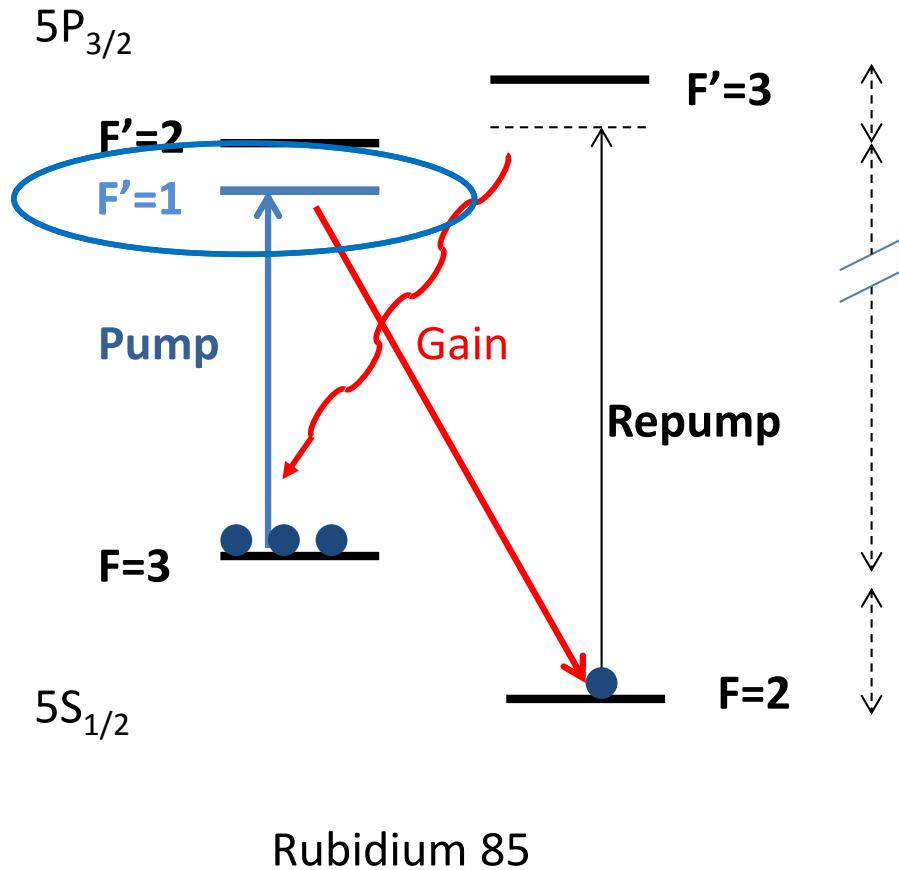

N. Mercadier: PhD 2011

Diffusion résonante de la lumière: laser aléatoire à atomes et vols de Lévy des photons

[1] Phys. Rev. Lett. **102**, 173903 (2009).

[2] Opt. Express **17**, 11236 (2009).

## Our choice for gain : Hyperfin Raman Gain

gain ☺ :  $b_{0,\text{cr}} = 90$

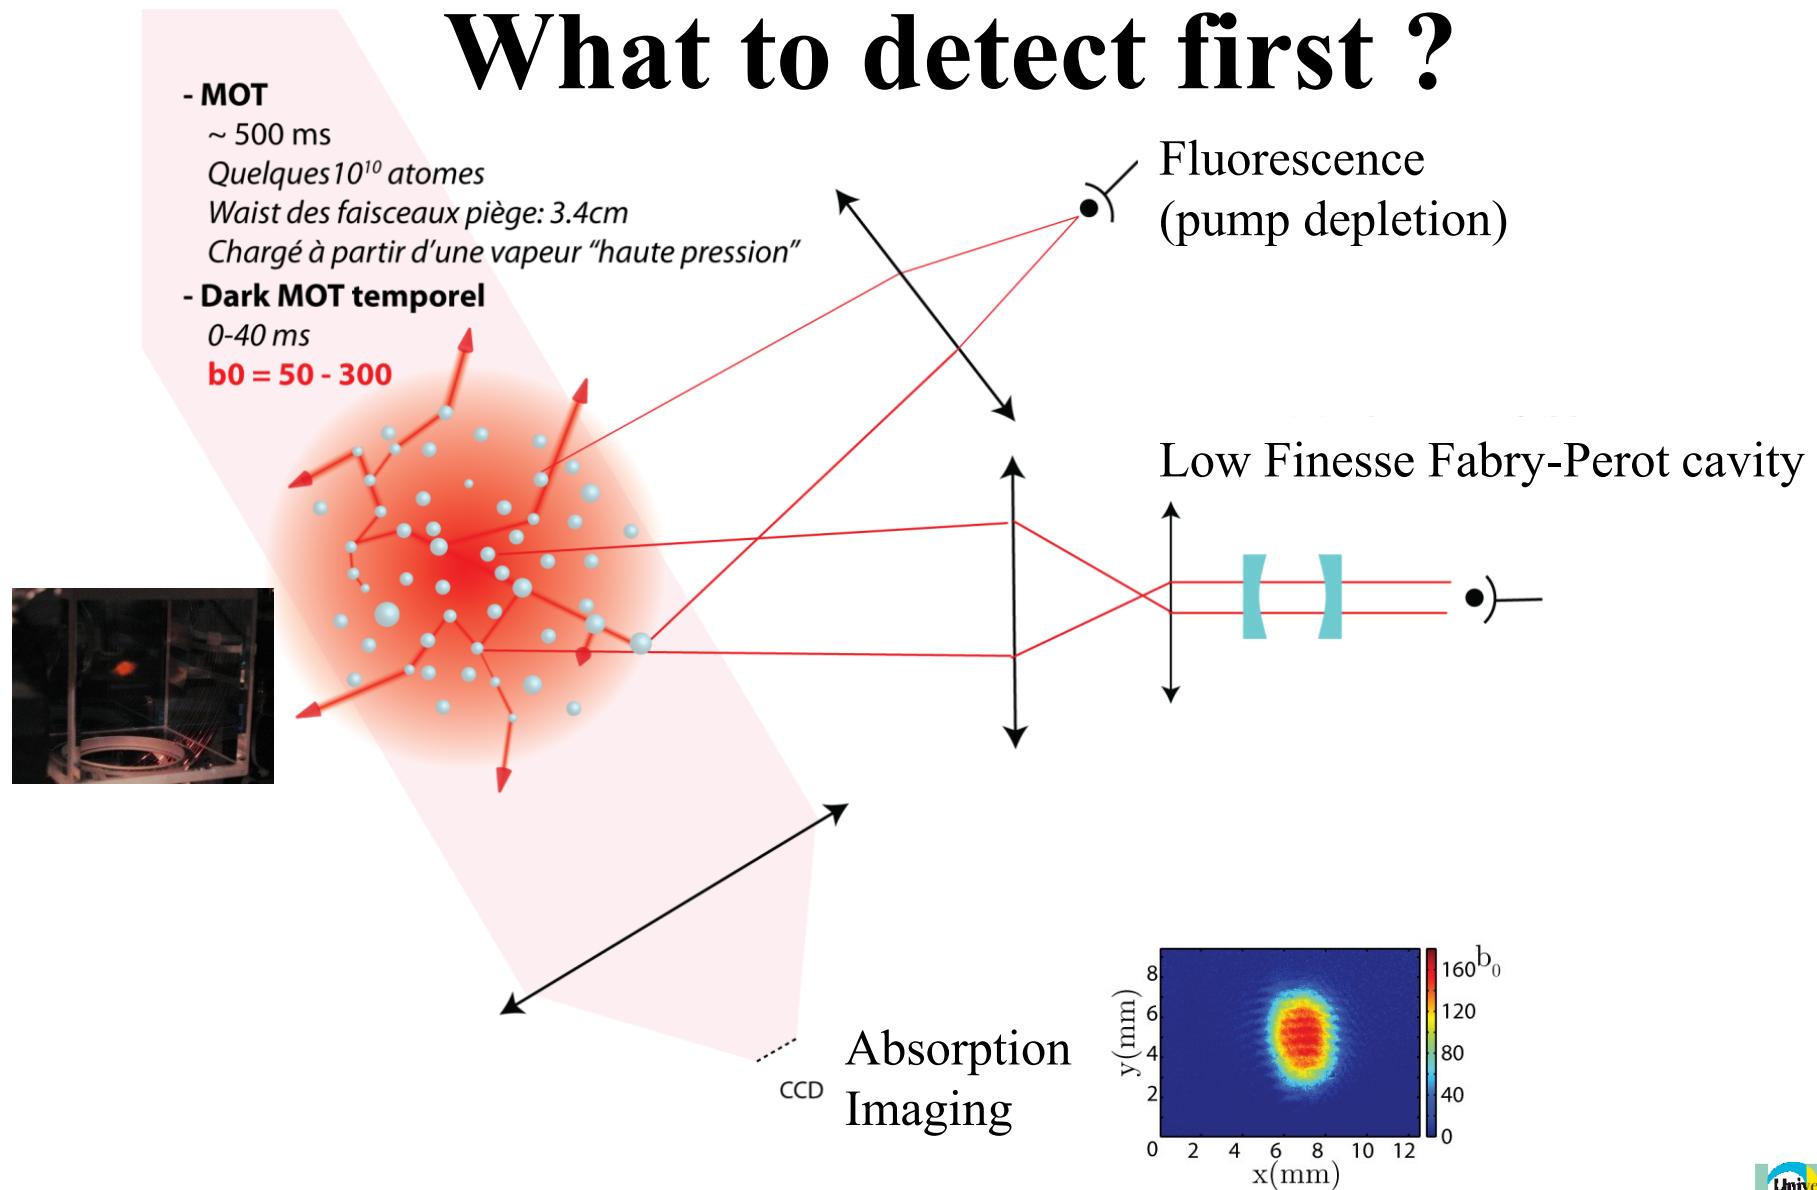

scattering ☹

**Added scattering**

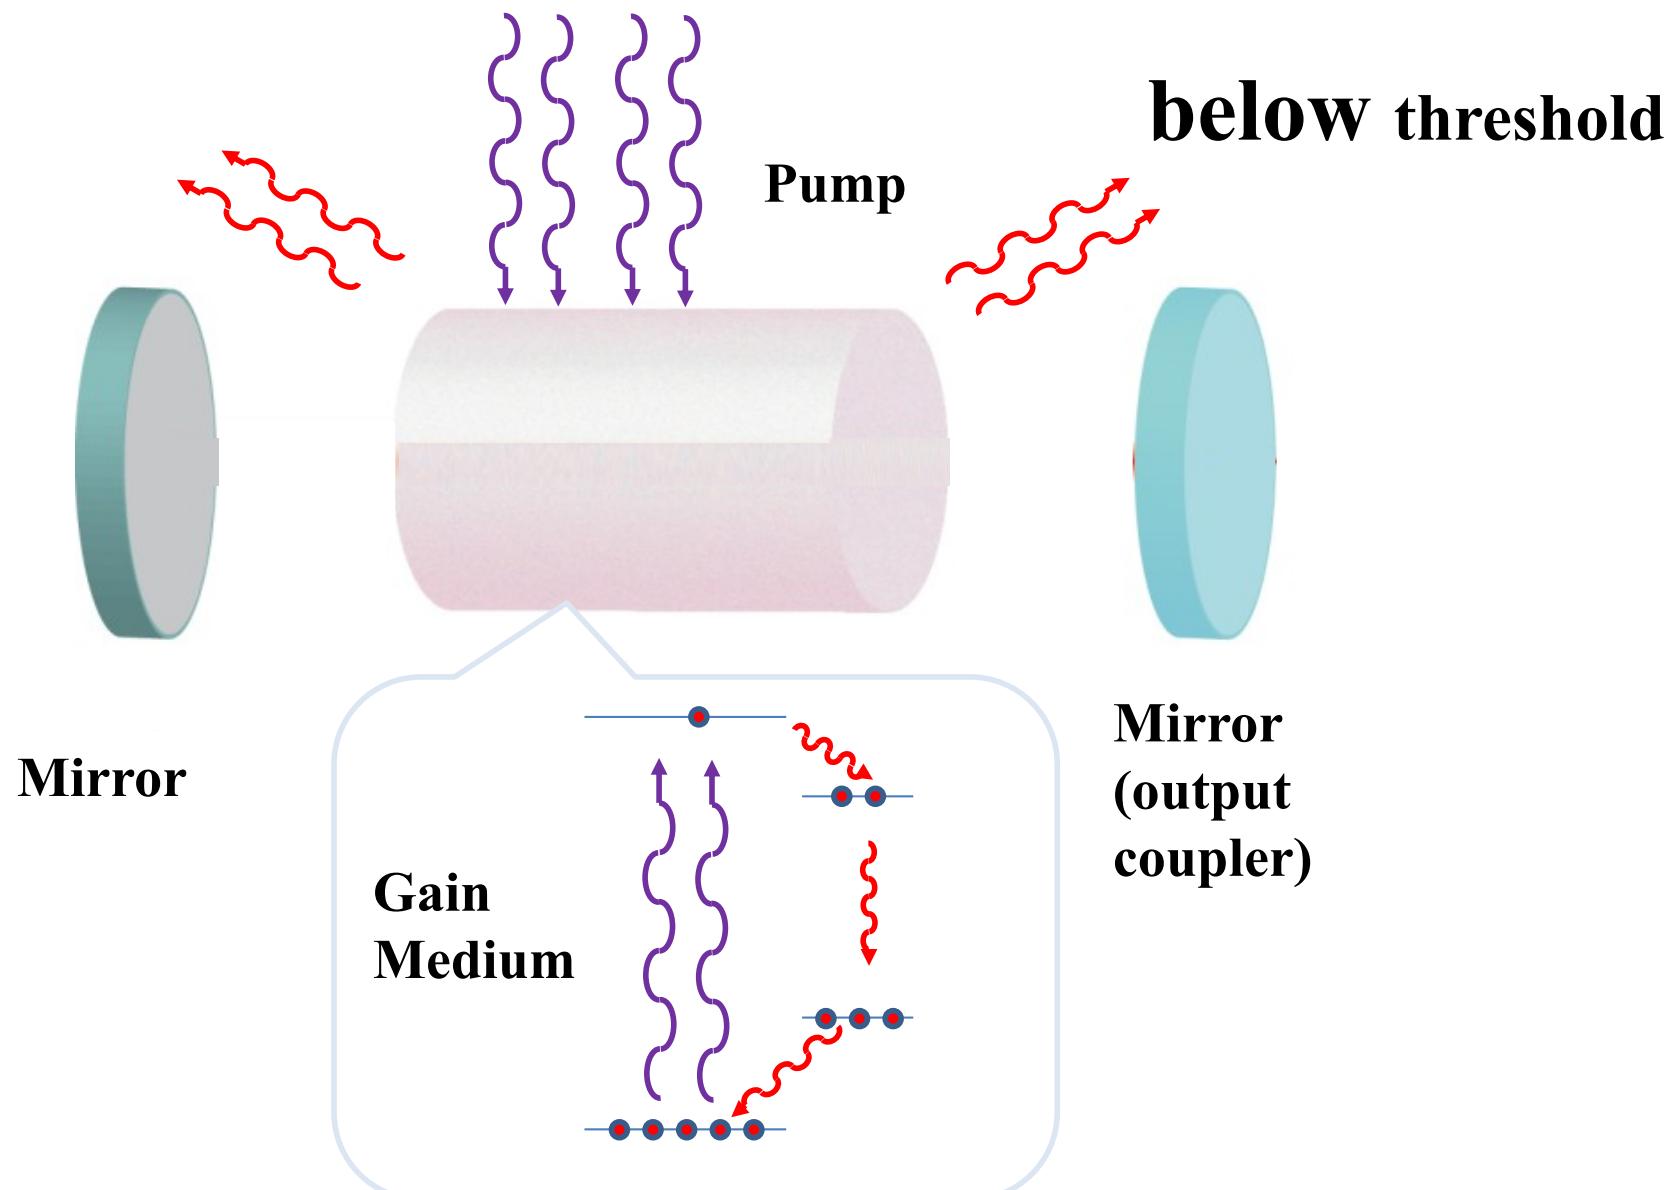

**$F=2 - F'=1$  : scattering ☺**

**$b_{0,\text{cr}} = 30 !$**

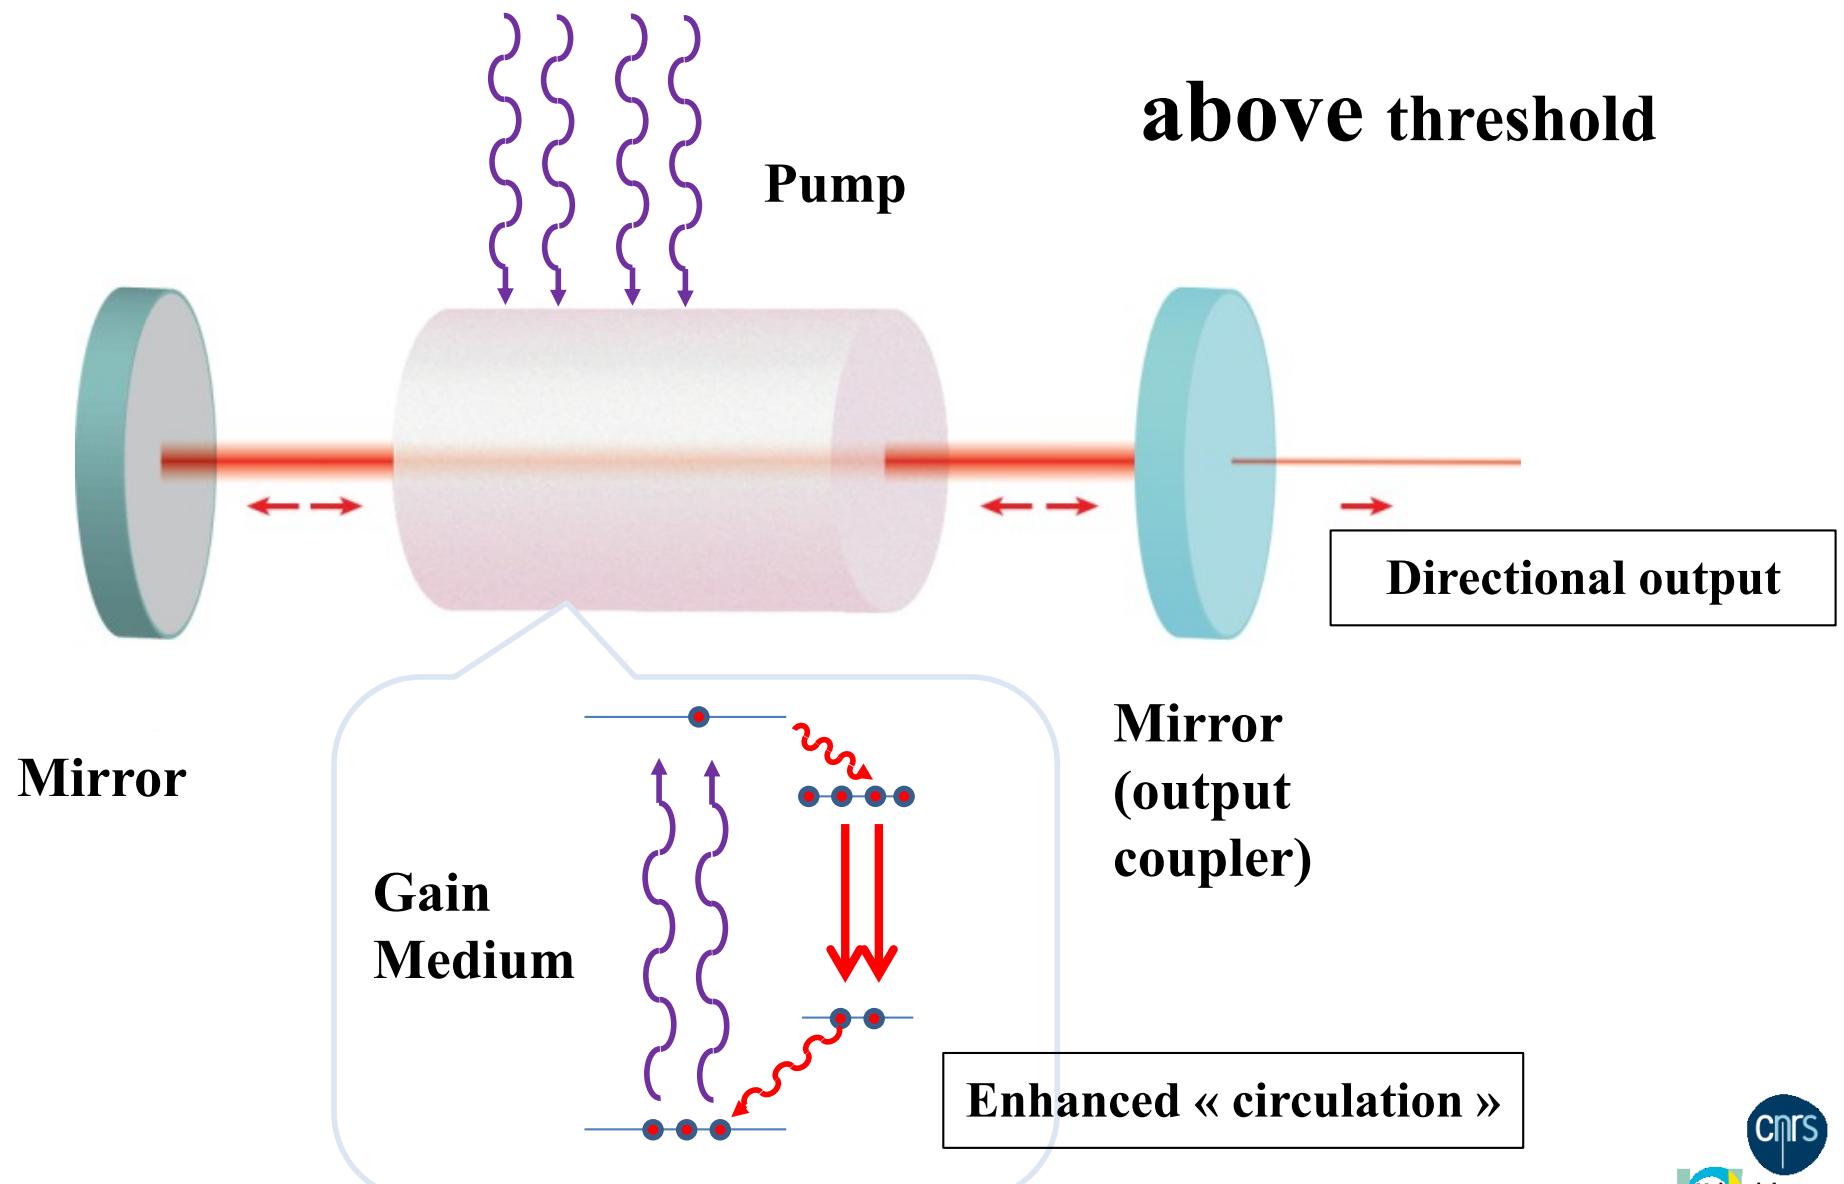

# The Experimental Setup : What to detect first ?

# A simple laser model

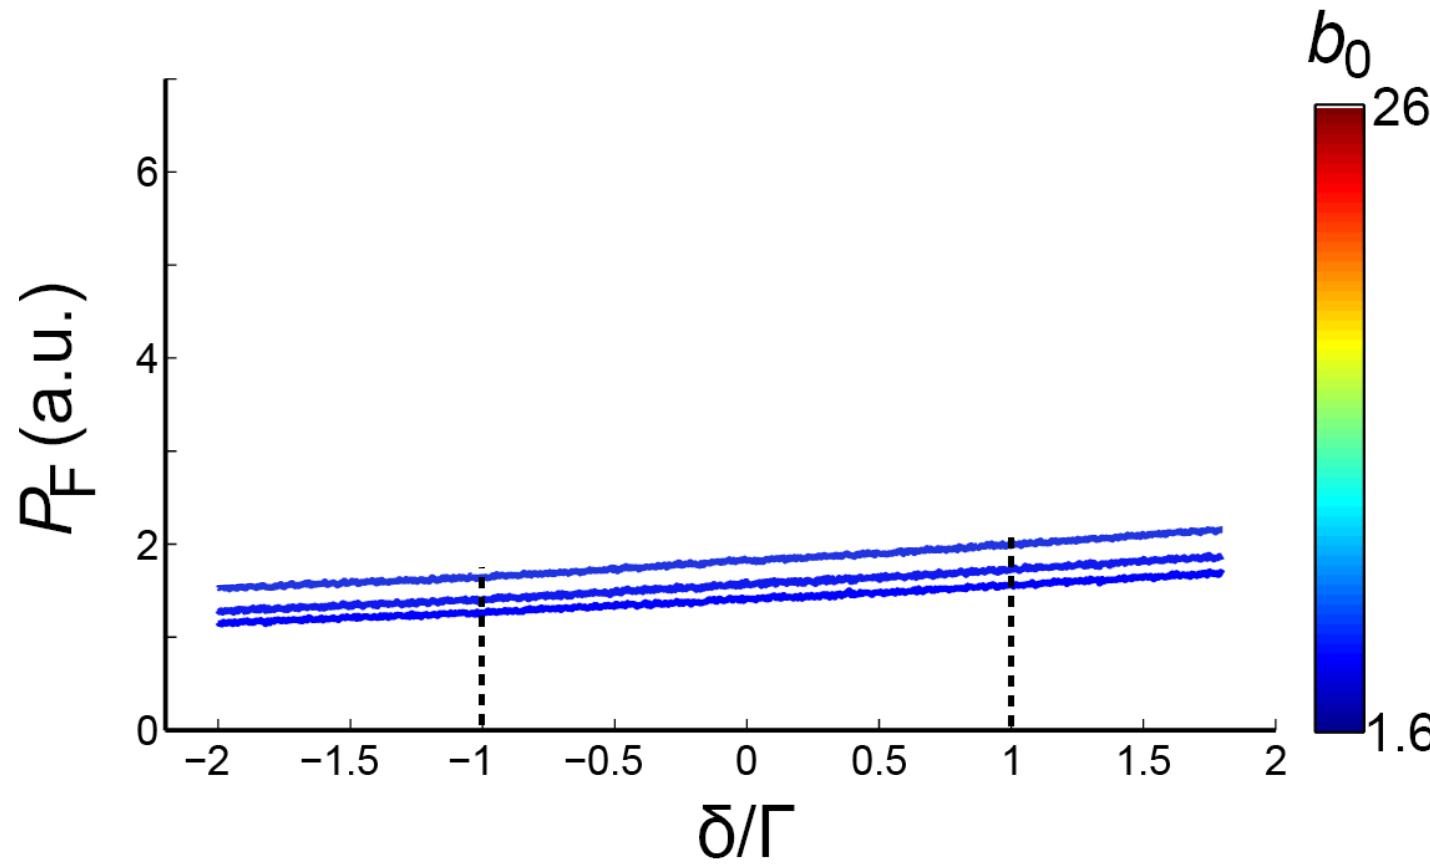

# A simple laser model

# Total Fluorescence

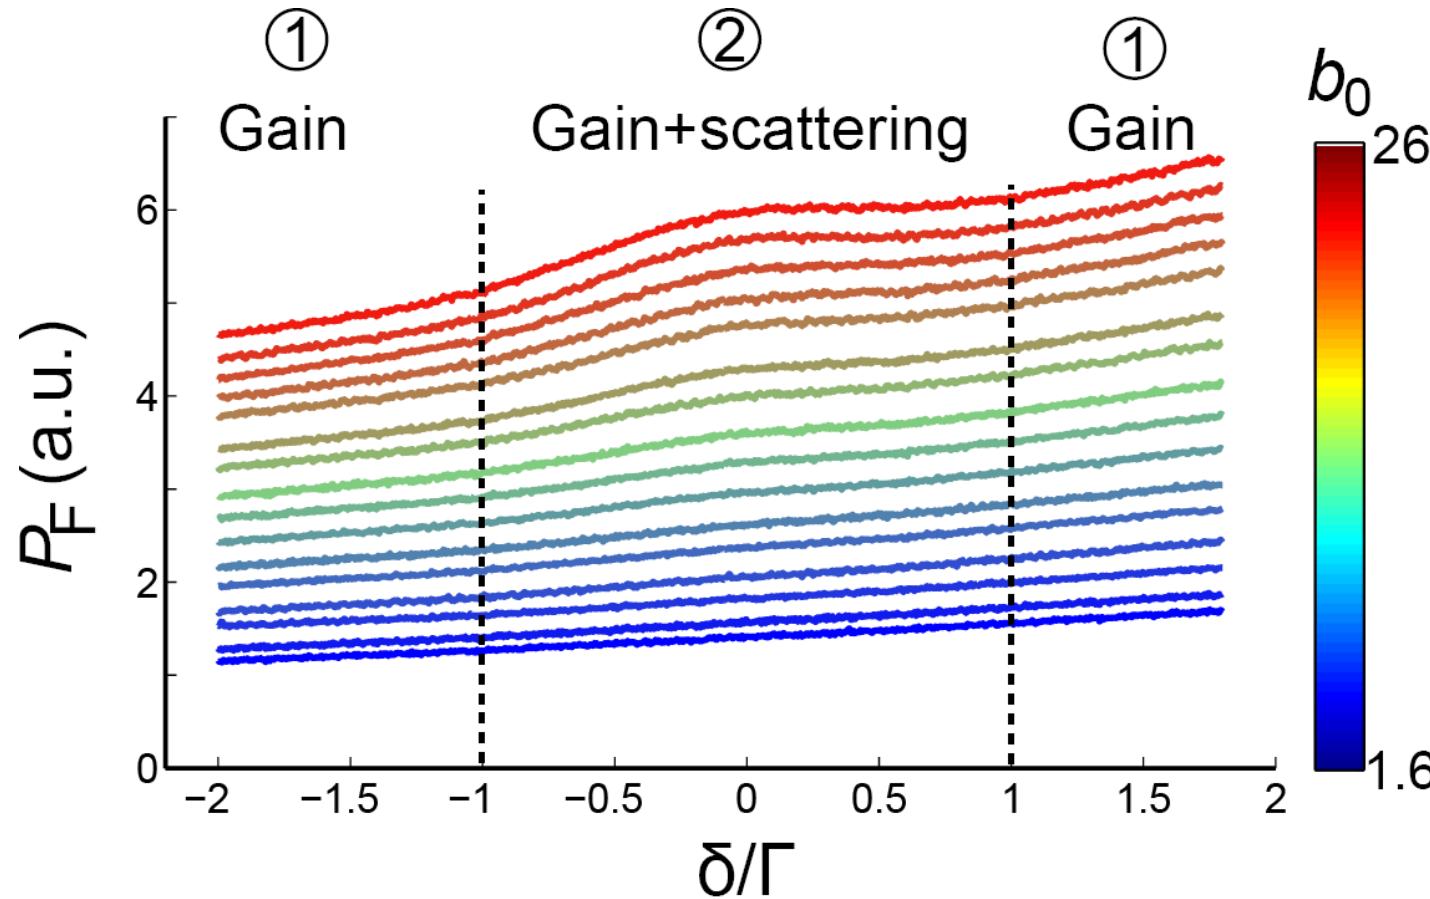

- No increase due to redirection of emitted photons  
(as in cavity laser)
- $N=c^{te}$  ! vary compression = change  $b_0$  @  $c^{te} N$

$$F=3 \rightarrow F'=1$$

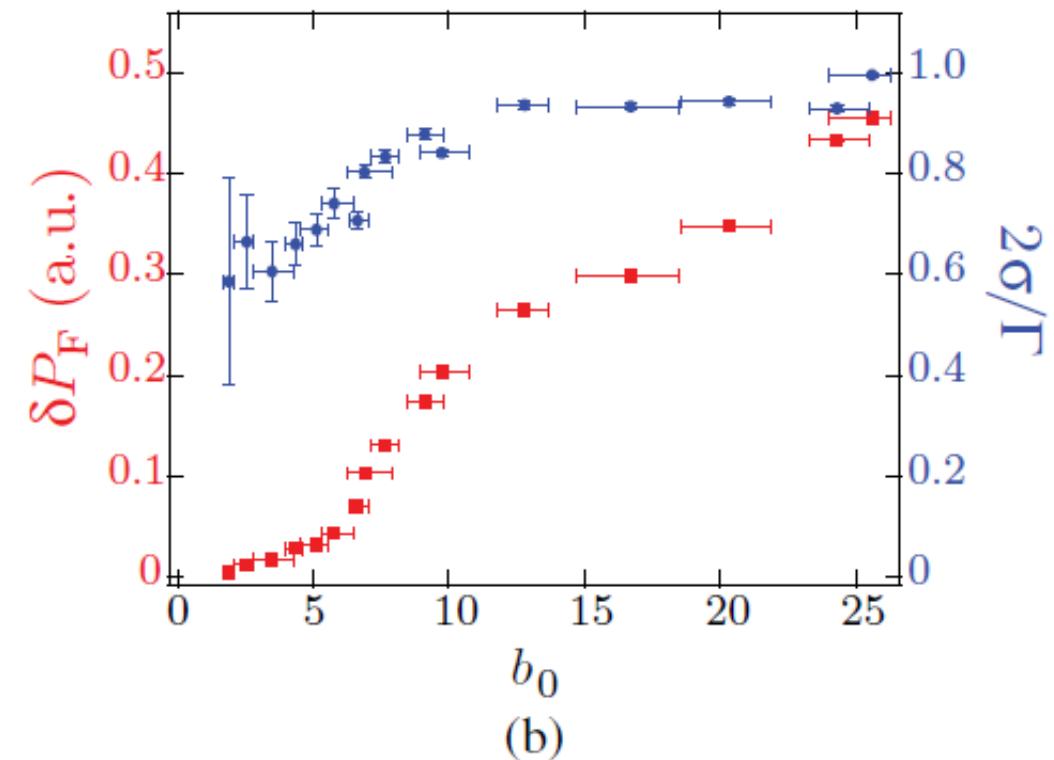

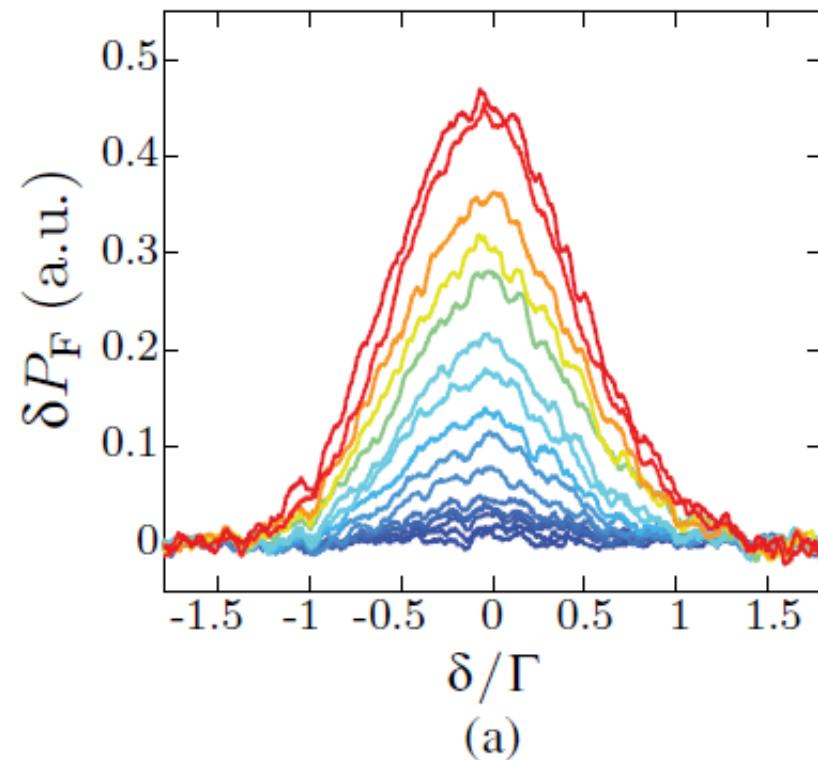

# Total Fluorescence

- No increase due to redirection of emitted photons (as in cavity laser)
- $N=c^{te}$  ! vary compression = change  $b_0$  @  $c^{te} N$

# Additional Fluorescence at RL condition

subtract the “ASE” background : extracted gaussian peak

# Microscopic modelling for cold atom random lasing

1) Input parameters : pump and repump lasers  $\{\Omega_{\text{Raman}}, \Delta_{\text{Raman}}, \Omega_{\text{pump}}, \Delta_{\text{pump}}\}$   
system « size »  $b_0$

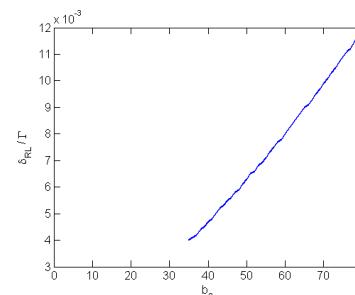

2)  $\Omega_{\text{RL}}, \Delta_{\text{RL}}$   $\Rightarrow$  density matrix / optical Bloch equations (4 level, 3 lasers)

$\Rightarrow \sigma_{\text{sc}}, \sigma_{\text{ext}}, \sigma_g$

$\Rightarrow$  4+1 model :  $\sigma_{\text{sc}} +$  scattering  $\sigma_{2-1},$

3) Compute ( $\Delta_{\text{RL}}$  free parameter)

$$2\pi \sqrt{(\sigma_0^2 / 3\sigma_g\sigma_{\text{sc}})} = b_{0,\text{Letokhov}}$$

4) If  $b_{0,\text{exp}} > b_{0,\text{Letokhov}}$  : our experiment must have more scattering

increase  $\Omega_{\text{RL}}$

5)  $b_{0,\text{exp}} = b_{0,\text{Letokhov}}$  : we know  $\Omega_{\text{RL}}$  (**including saturation**, which sets losses = gain)

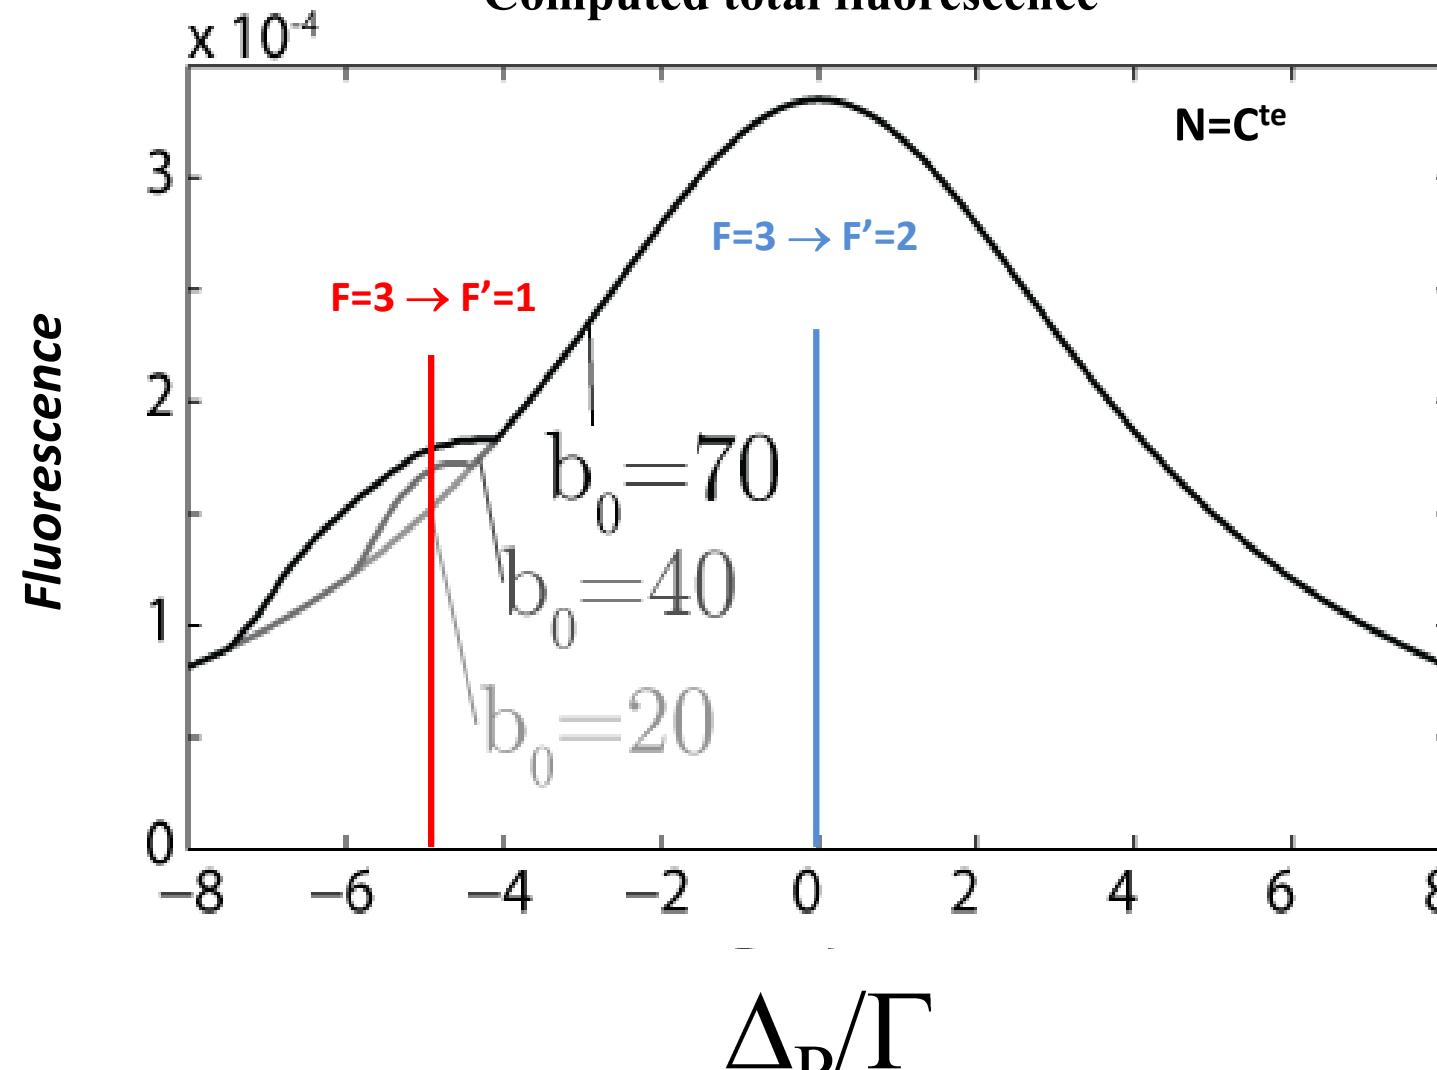

6) Compute pump and repump extinction = total fluorescence ☺

7) ☺ misses Raman hyperfin gain below threshold

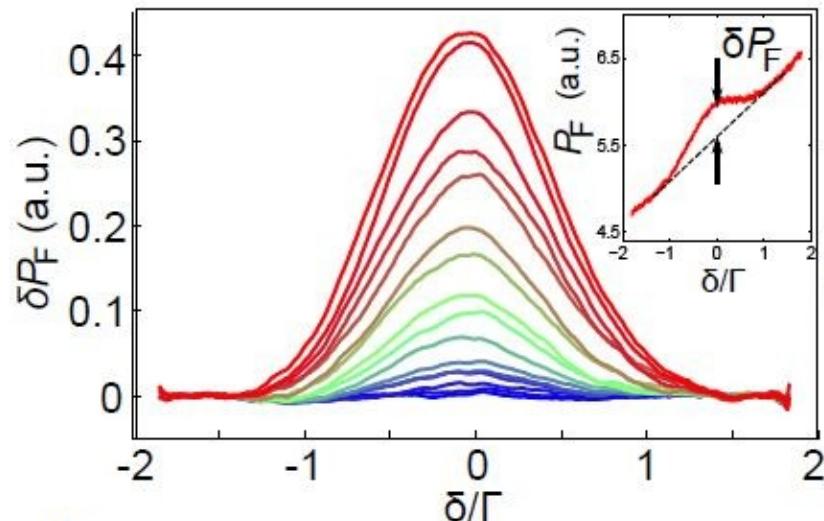

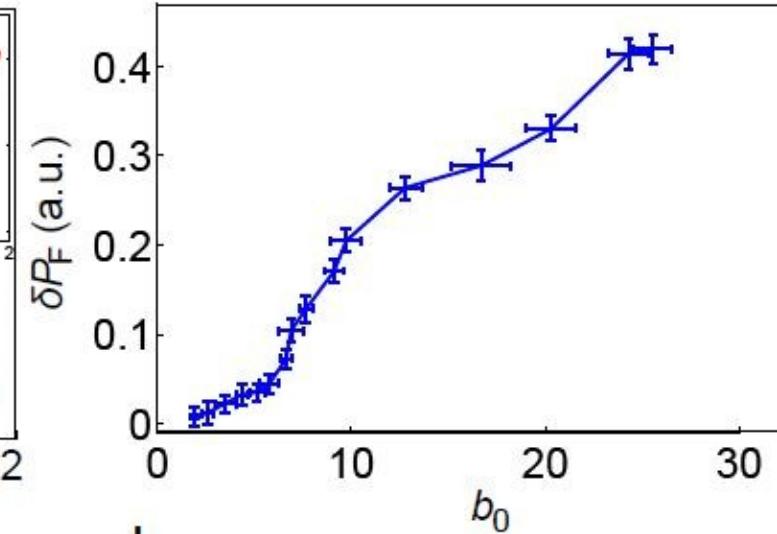

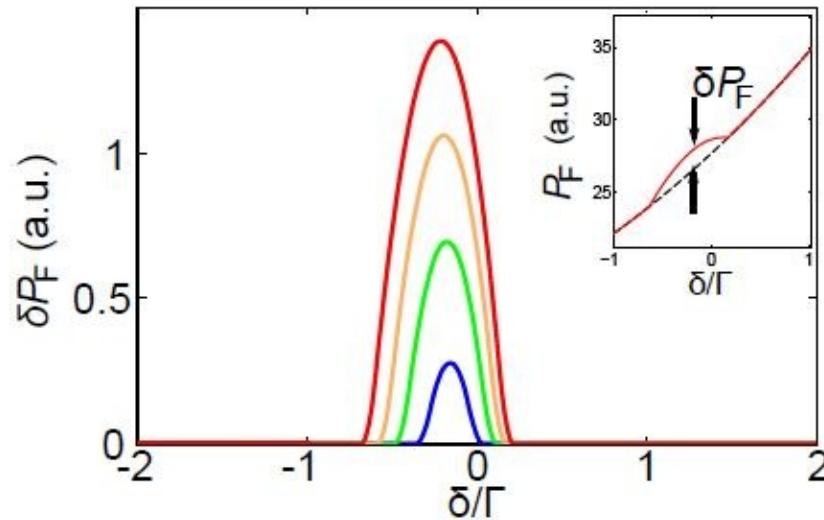

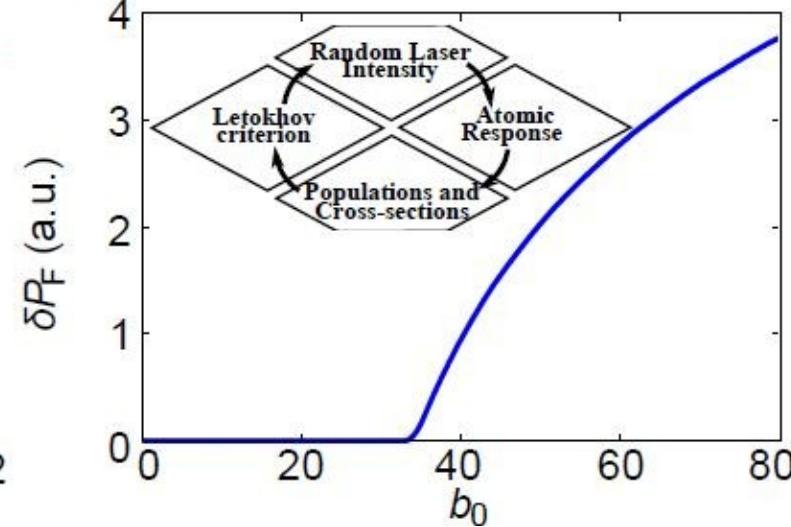

# Microscopic modelling for cold atom random lasing

Input parameters : pump and repump lasers  $\{\Omega_P, \Delta_P, \Omega_{\text{rep}}, \Delta_{\text{rep}}\}$ , system « size »  $b_0$

Computed total fluorescence

# Microscopic modelling for cold atom random lasing

**a****b****c****d**

# Microscopic modelling for cold atom amplified spontaneous emission

Optical Bloch equations (no scattering) :

Start with  $\Omega_{RL}=0$

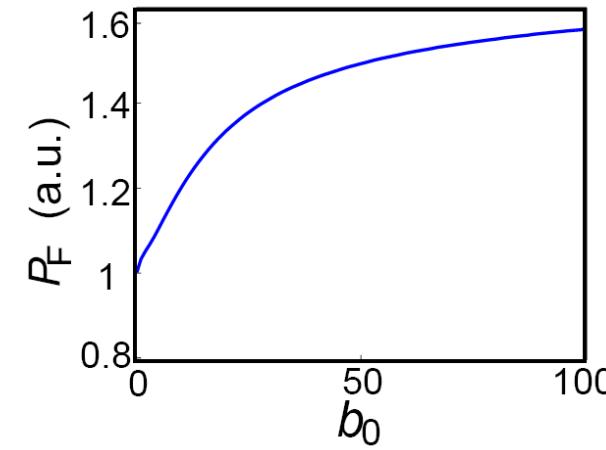

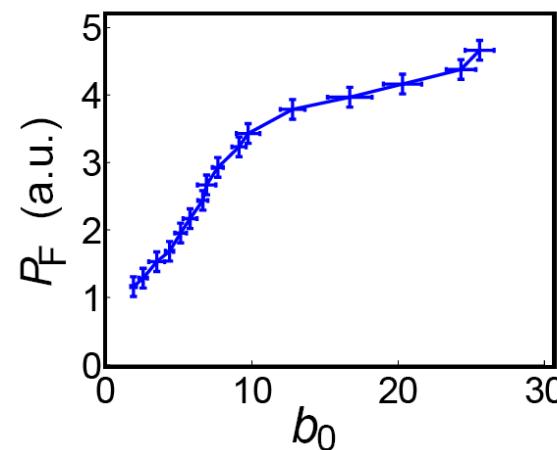

Source term corresponding to spontaneous Raman scattering

Compute intensity at the center of the cloud (emission from all atoms towards center)

Scan detuning of emitted light for maximum emission

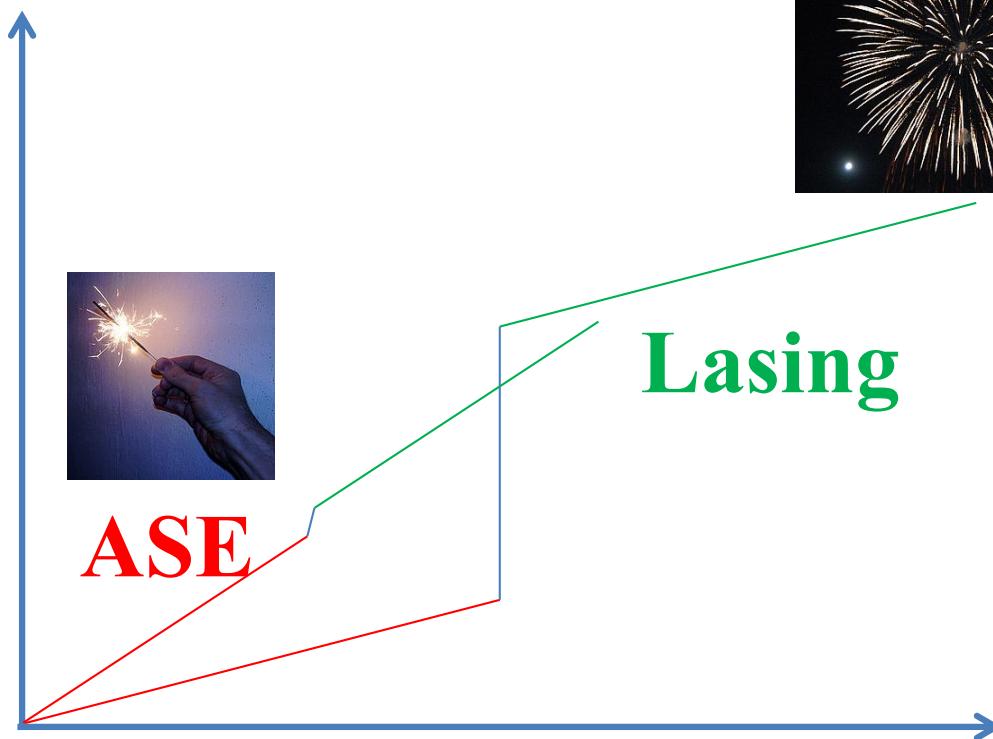

Includes gain saturation

Amplified  
Spontaneous  
Emission

# ASE and gain saturation

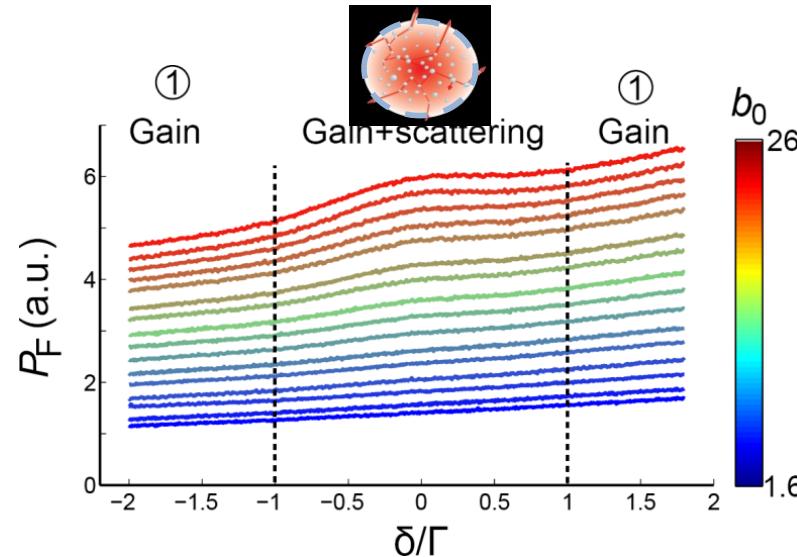

Emitted power

Pump power

# Conclusion:

- Combination of scattering and gain observed in cold atoms
- Microscopic Model in qualitative agreement
- Dilute gaz quasi cw random laser

## A cold-atom random laser
