

Air quality modelling: A support for short term and long term policies

Frederik Meleux, Augustin Colette, Bertrand Bessagnet

Institut National de L'Environnement Industriel et des Risques

-
- The diagram illustrates the transport of aerosols and gases from the surface to the stratosphere. It is divided into three main vertical layers: the Stratosphere, Troposphere, and Boundary Layer. Key processes and sources shown include:
- Water vapor** transport from the surface to the stratosphere.
 - Aircraft emissions** (NO, Black Carbon, Sulfur) and **Q₂ destruction** in the stratosphere.
 - Long-range transport of aerosols and gases** between the troposphere and stratosphere, involving **O₃ production** and **O₃ destruction**.
 - Free Troposphere** and **Boundary Layer** regions.
 - Surface emissions** from various sources:
 - Cities:** Natural and anthropogenic emissions from the Earth (CO₂, CH₄, SO₂, NO_x, CFCs, HFCs, PFCs, N₂O).
 - Industry:** SO₂, NO_x, CO₂, CH₄, HFCs, PFCs, N₂O.
 - Agriculture:** CH₄, N₂O, CO₂, HFCs, PFCs, N₂O.
 - Forest fires:** Aerosols, CO₂, CH₄, HFCs, PFCs, N₂O.
 - Volcanic eruptions:** Aerosols, CO₂, CH₄, HFCs, PFCs, N₂O.
 - Oceans:** Aerosols, CO₂, CH₄, HFCs, PFCs, N₂O.
 - Exposition and Conversion** of surface emissions into **Surface emissions from oceans**.
 - Transportation** of emissions from the surface to the troposphere.

Air quality impacts on health in Europe

Health impacts:

Premature death in people
with heart or lung disease
nonfatal heart attacks
irregular heartbeat
aggravated asthma
decreased lung function
respiratory symptoms
(coughing or breathing
difficulty).

Loss in life expectancy due to PM2.5
TSAP Report #10, IIASA 2013

Health impacts in Europe:

- loss in life expectancy ~8.5months
- 400,000 anticipated deaths each year

Table ES.1 Percentage of the urban population in the EU exposed to air pollutant concentrations above the EU and WHO reference levels (2009–2011)

Pollutant	EU reference value	Exposure estimate (%)	WHO AQG	Exposure estimate (%)
PM _{2.5}	Year (20)	20–31	Year (10)	91–96
PM ₁₀	Day (50)	22–33	Year (20)	85–88
O ₃	8-hour (120)	14–18	8-hour (100)	97–98
NO ₂	Year (40)	5–13	Year (40)	5–13
BaP	Year (1)	22–31	Year (0.12)	76–94
SO ₂	Day (125)	< 1	Day (20)	46–54
CO	8-hour (10)	< 2	8-hour (10)	< 2
Pb	Year (0.5)	< 1	Year (0.5)	< 1
Benzene	Year (5)	< 1	Year (1.7)	12–13
Colour coding:	< 5 %	5–50 %	50–75 %	> 75 %

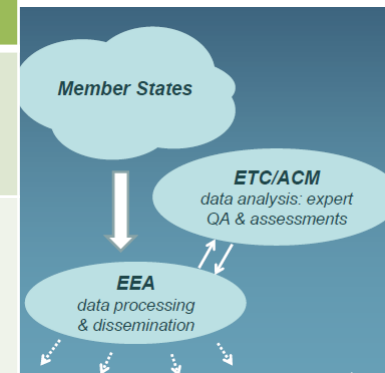

AQ targets largely exceeded in
urban areas

European legislation for ambient air quality: Air quality package

- Council Directive **96/62/EC** of 27 September 1996 on ambient air quality assessment and management
- Directive **2004/107/EC** of the European Parliament and of the Council of 15 December 2004 relating to arsenic, cadmium, mercury, nickel and polycyclic aromatic hydrocarbons in ambient air
- Directive **2008/50/EC** of the European Parliament and of the Council of 21 May 2008 on ambient air quality and cleaner air for Europe: Ozone, PM10, PM2.5, NO2, SO2, CO, C6H6, Pb
 - Monitoring standards : certified instruments, network set-up rules (number of sites, typology, location), quality objectives
 - Limit and target values for ambient concentrations
 - Implementation provisions for regulatory reporting
 - Actions in plans in terms of non attainment of air quality objectives
 - Public information

Current situation : Limit values

Pollutants	AQ Directive 2008/50/EC	Guideline values (WHO)
PM10	50 $\mu\text{g}/\text{m}^3$ daily average not exceeded more than 35 times/year 40 $\mu\text{g}/\text{m}^3$ yearly average	50 $\mu\text{g}/\text{m}^3$ daily average 20 $\mu\text{g}/\text{m}^3$ yearly average
PM2.5	Exposure index based on the daily average 25 $\mu\text{g}/\text{m}^3$ yearly average (20 $\mu\text{g}/\text{m}^3$ in 2020)	25 $\mu\text{g}/\text{m}^3$ daily average 10 $\mu\text{g}/\text{m}^3$ yearly average
O3	120 $\mu\text{g}/\text{m}^3$ 8-hours average not exceeded more than 25 days/year	100 $\mu\text{g}/\text{m}^3$ 8-hours average
NO2	40 $\mu\text{g}/\text{m}^3$ yearly average 200 $\mu\text{g}/\text{m}^3$ hourly average not exceeded more than 18 times/year	40 $\mu\text{g}/\text{m}^3$ yearly average 200 $\mu\text{g}/\text{m}^3$ hourly average
SO2	350 $\mu\text{g}/\text{m}^3$, hourly average not exceeded more than 18 times/year 125 $\mu\text{g}/\text{m}^3$ daily average not exceeded more than 5 times/year	20 $\mu\text{g}/\text{m}^3$ daily average 500 $\mu\text{g}/\text{m}^3$ 10min average

European legislation for ambient air quality: : Air quality package

- Council Directive **96/62/EC** of 27 September 1996 on ambient air quality assessment and management
- Directive **2004/107/EC** of the European Parliament and of the Council of 15 December 2004 relating to arsenic, cadmium, mercury, nickel and polycyclic aromatic hydrocarbons in ambient air
- Directive **2008/50/EC** of the European Parliament and of the Council of 21 May 2008 on ambient air quality and cleaner air for Europe: Ozone, PM10, PM2.5, NO2, SO2, CO, C6H6, Pb
 - Monitoring standards : certified instruments, network set-up rules (number of sites, typology, location), quality objectives
 - Limit and target values for ambient concentrations
 - Implementation provisions for regulatory reporting
 - Actions in plans in terms of non attainment of air quality objectives
 - Public information
- Directive 2001/81/EC of the European Parliament and of the Council of 23 October 2001 **on national emission ceilings for atmospheric pollutants**
 - **NOx, VOCs, SO2, NH3 -> should be revised in 2013 to include fine PM**

Emissions have decreased... but exposure remains high

Emissions reduction relative to 2002 for the main pollutants and precursors

NO₂ PM₁₀ O₃ SO₂

Fraction of the urban population exposed to air pollution exceeding WHO air quality guidelines EEA, 2013

Main challenges for PM pollution today in the EU

- Residential (wood burning)
- Agricultural emissions : (ammonia is a precursor of fine particles)
- Traffic
 - Low emission zones (road)
 - Reducing speed limits (road)
 - Cleaner engines and fuels (whatever the mode)
 - Control of road resuspension
- Industrial emissions
- Quantify the contribution of natural sources (fires, mineral dusts)

Sector contributions of emissions of primary particulate matter and secondary precursors (EEA member countries)

Source: EEA

The French response to improve air quality

- French order of March 26th, 2014

JORF n°0075 du 29 mars 2014 page 6139
texte n° 30

ARRETE

Arrêté du 26 mars 2014 relatif au déclenchement des procédures préfectorales en cas d'épisodes de pollution de l'air ambiant

Objectives:

- Anticipation of pollution episodes to implement mitigation measures in a more efficient way
- Definition of exposure criteria based on air quality forecasts

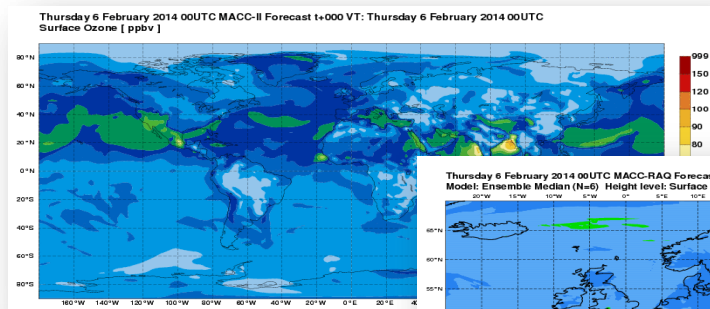

The prevair.org system

- An operational system building on numerical tools to reinforce the air quality management network:
 - Daily forecasts delivered by 8 am
 - Daily peak and daily averaged values for: J+0, J+1, J+2
 - Pollutants: O3, NO2, Aerosols (PM10, PM2.5 and DUST)

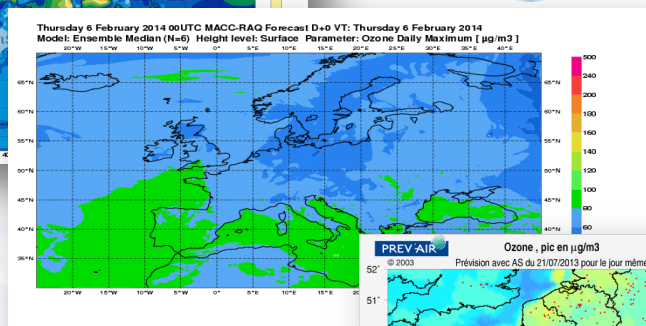

Cascade of air quality forecasts at various scale

Global

Europe

National

-bridging the scale in forecast mode:
contribution of long-range transport as
well as local emissions

PREv'AIR objectives: public information

- In case of pollution events, there is an agreement between ministry of ecology and National TV for broadcasting air quality forecasts

Definition of an air quality episode (according to the order)

A **reported or forecast** exceedance is characterized as a pollution episode if **one of the following conditions is fulfilled**:

Condition based on	Scale	Criterion
Surface	French administrative region	At least 100 km ² inside a region are affected by an exceedance
Population	French department	At least 10% of the population within a department of more than 500000 inhabitants are exposed to an exceedance. or At least 50000 inhabitants within a department of less than 500000 inhabitants are exposed to an exceedance.
Local particularities	Local area	Specific conditions (geographical and dispersion conditions, local emissions...) likely to cause exceedances

Threshold (µg.m ⁻³)	O ₃	PM ₁₀	NO ₂
Info & recommendations	180	50	200
Alert	240	80	400

⇒ **Requirement:** evaluation of criteria with AQ forecasts

Communication to local authorities

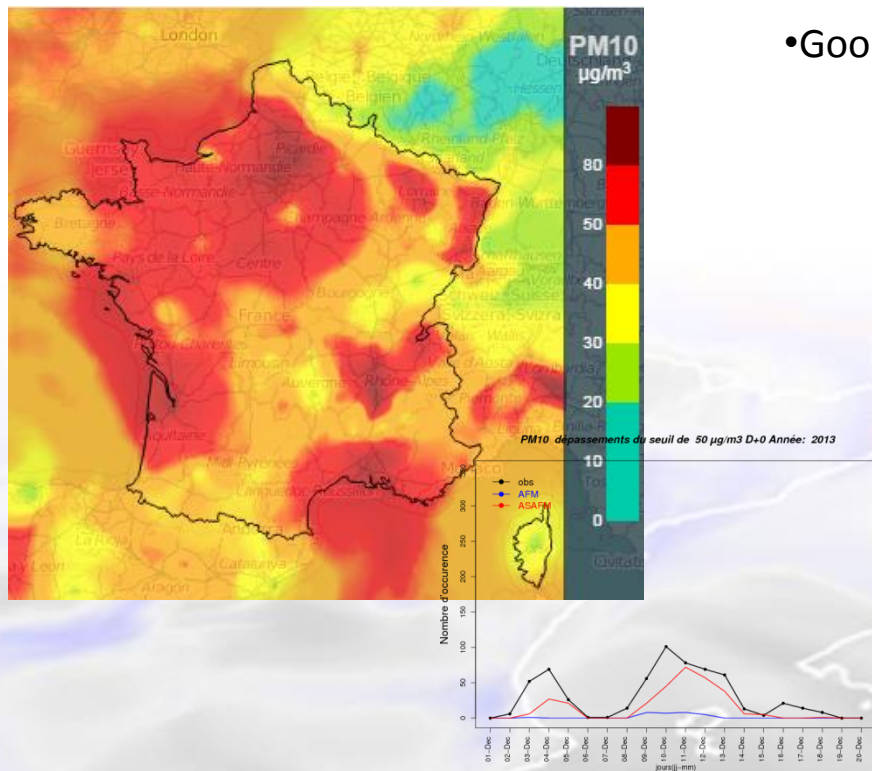

All the results (exceedance area, exposed population, comparison with the criteria) are gathered in synthetic files (one per region, per pollutant and per threshold) which are made available to the AASQAs on the PREV'AIR website (+ email sending) around 8.30 am.

Example of possible use of PREV'AIR products by the AASQAs

PM10 episode : decembre 2013

- Good temporal detection of exceedances

PM10 episode : decembre 2013

- Good temporal detection of exceedances
- Complementary to the chemical data from the CARA network

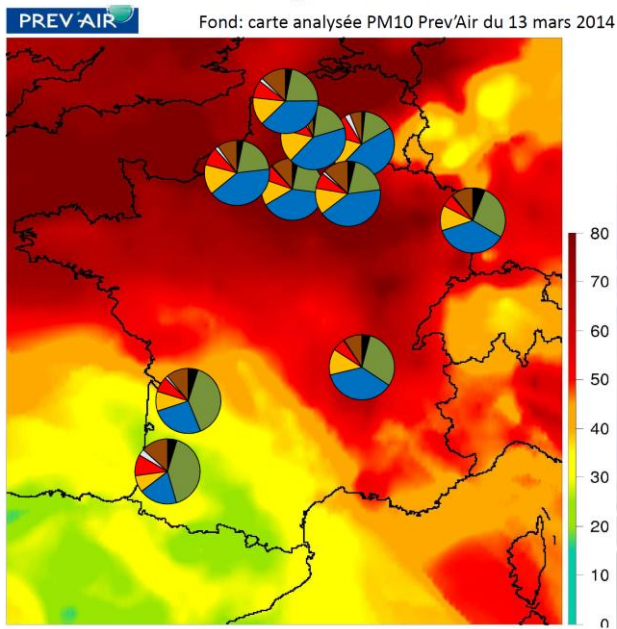

During episodes, chemical analyses of the major species and source tracers are performed by the LCSQA in collaboration with university laboratories.

Evolution toward automatic measurement.

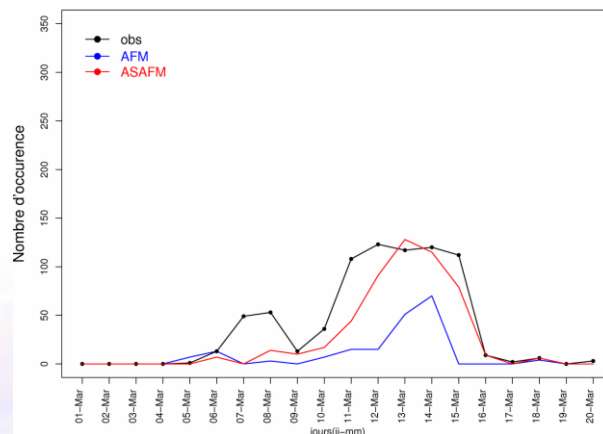

PM10 episode : March 2014

Répartition des espèces chimiques majeures au sein des PM₁₀, moyenne du 11 au 15 mars 2014

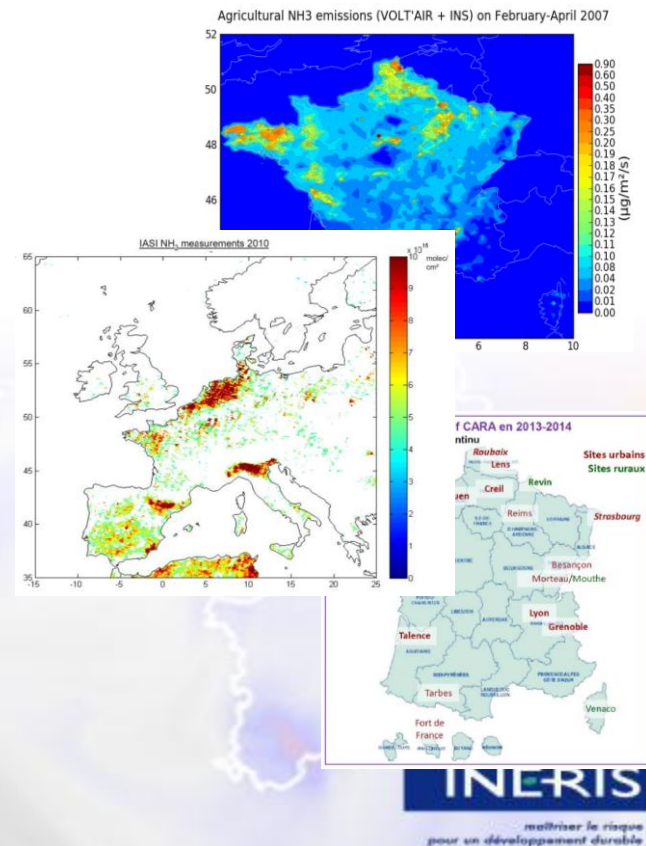

PM10 dépassements du seuil de 50 µg/m3 D+0 Année: 2014

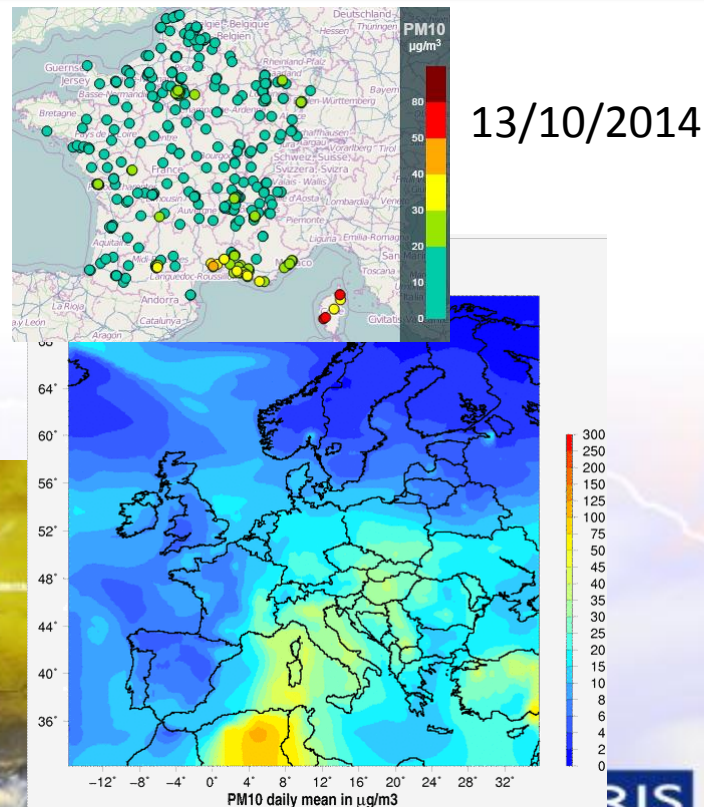

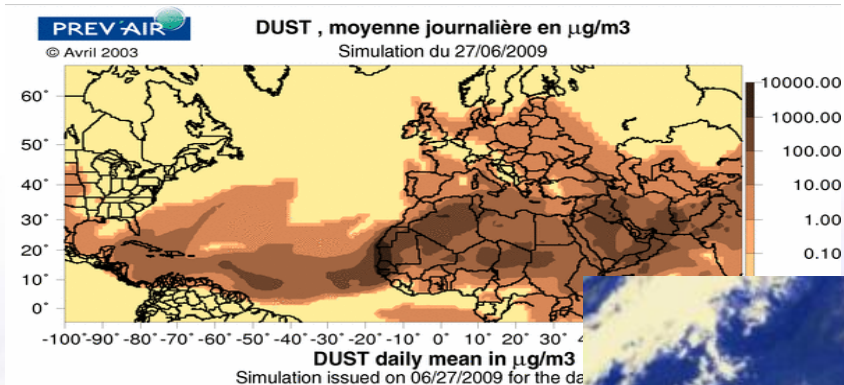

Interactive emissions

- The emissions are based on annual total emission on which are applied fixed temporal profile to provide hourly emissions
- Dynamic emissions mean to forecast the impact of meteorological conditions (forecasts) on emission intensity and variability (temporal)
 - Effort has been done successfully to modulate the emission of the domestic sector (SNAP2)
 - Significant improvement of the PM10 forecasts during wintertime
- For others emission sectors, it would need to extent such approach:
 - SNAP6: solvent emissions dependant of the temperature
 - SNAP10: Agricultural emissions (NH3)
 - SNAP7: Traffic emissions

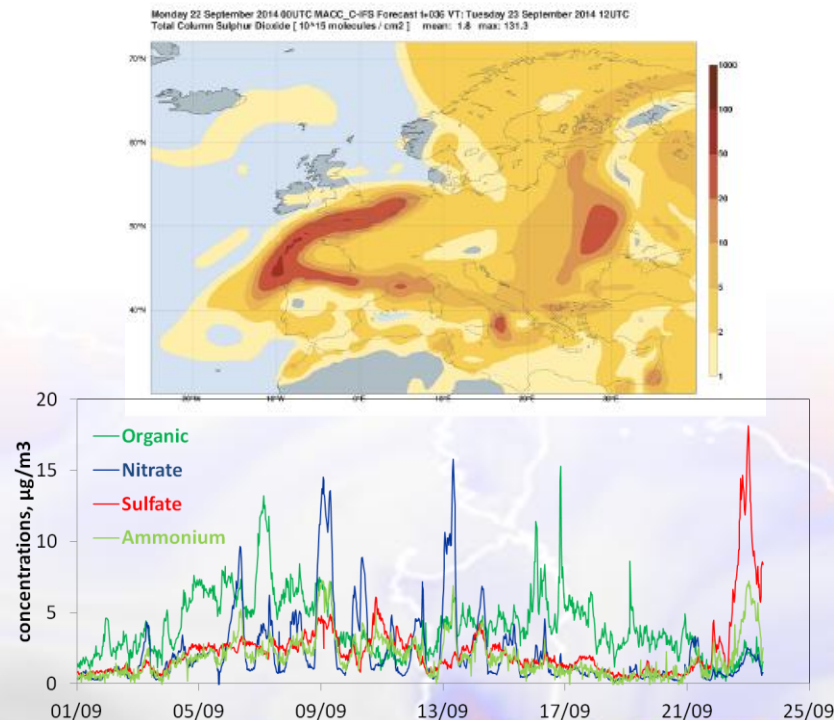

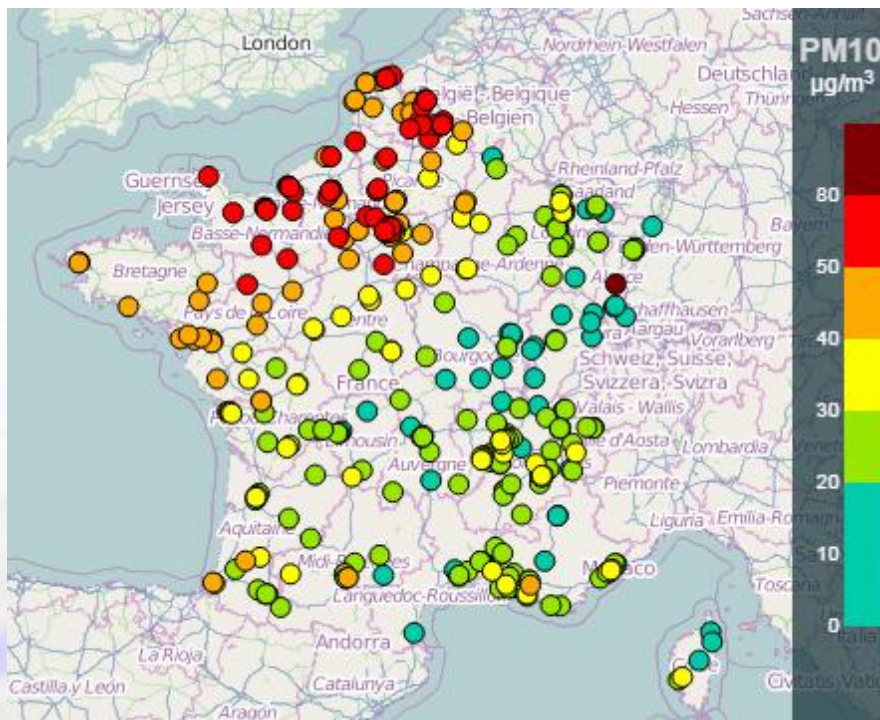

Evaluation of the natural contributions: desert dust

- Saharan dusts events can make the PM₁₀ concentrations exceed information thresholds

Volcanic eruption in Iceland – Bardarbunga (Sep. 2014)

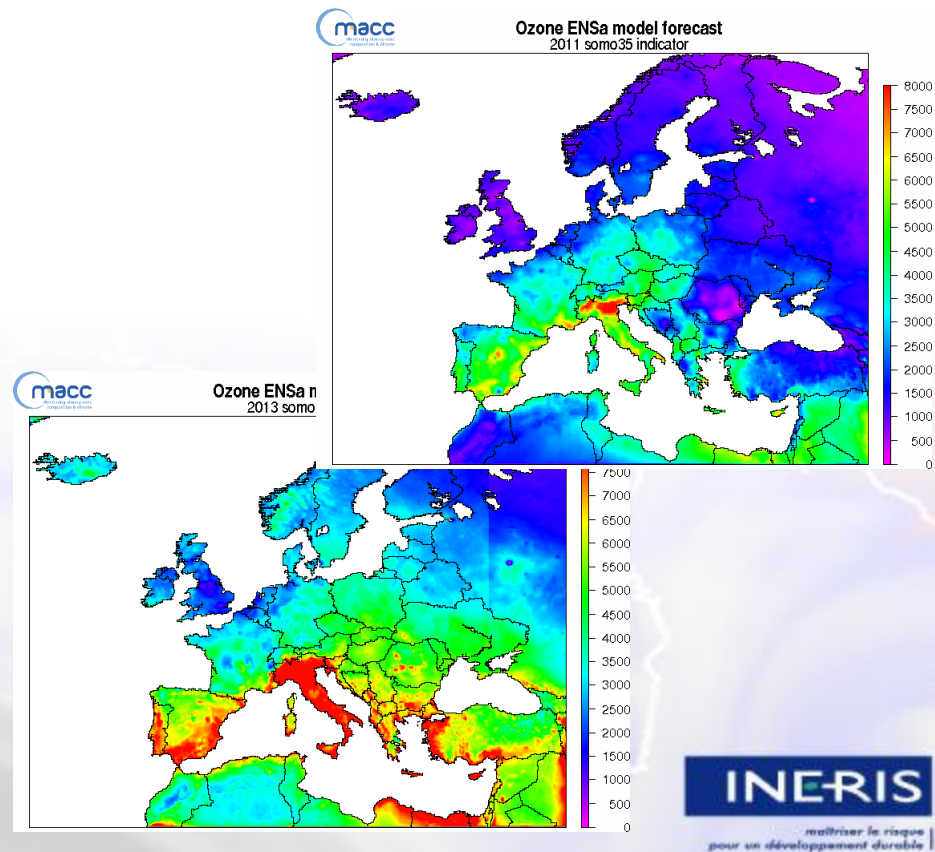

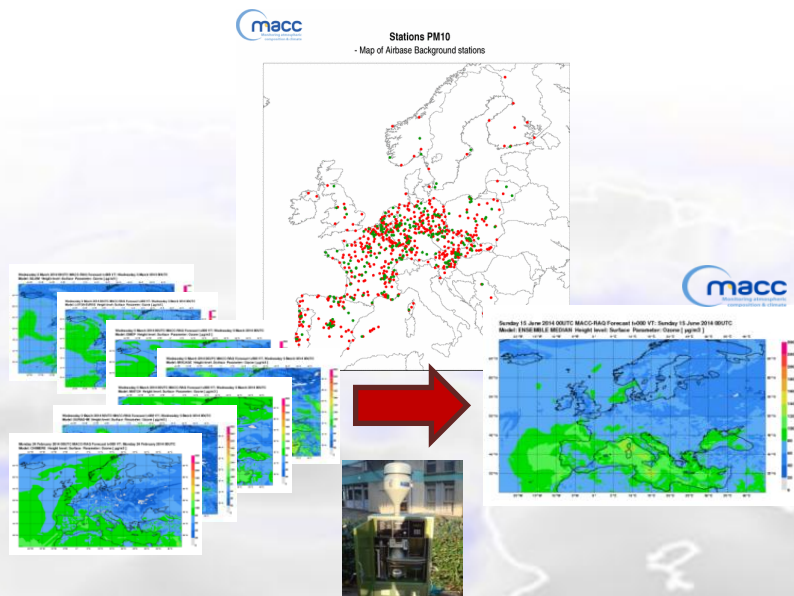

Why assessing natural contribution is important ?

- Specific treatment to remove the natural contributions from PM10 measurements
 - Sea salt, biomass burning, dust & volcano contributions
 - Implies a reduction of number of non regulatory report of PM10 values
 - Savings

MACC-reanalyses : EEA support

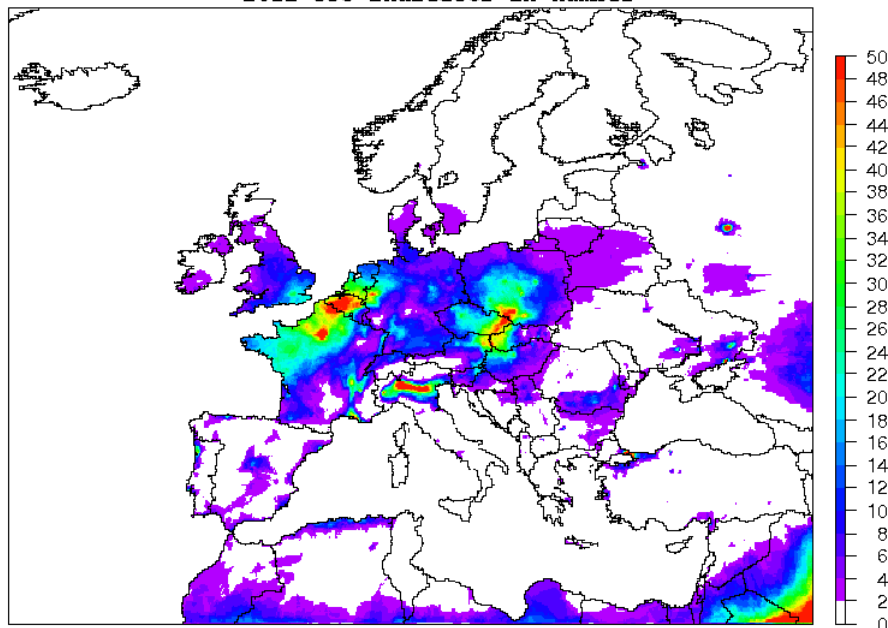

Every year, MACC produces AQ report for previous year describing AQ indicators

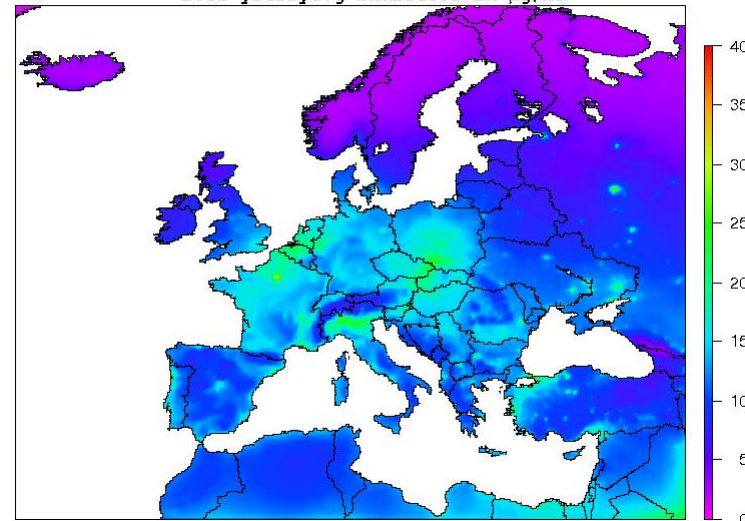

MACC-reanalyses : EEA support

PM10 Model reanalysis
2012 t35 indicator in number

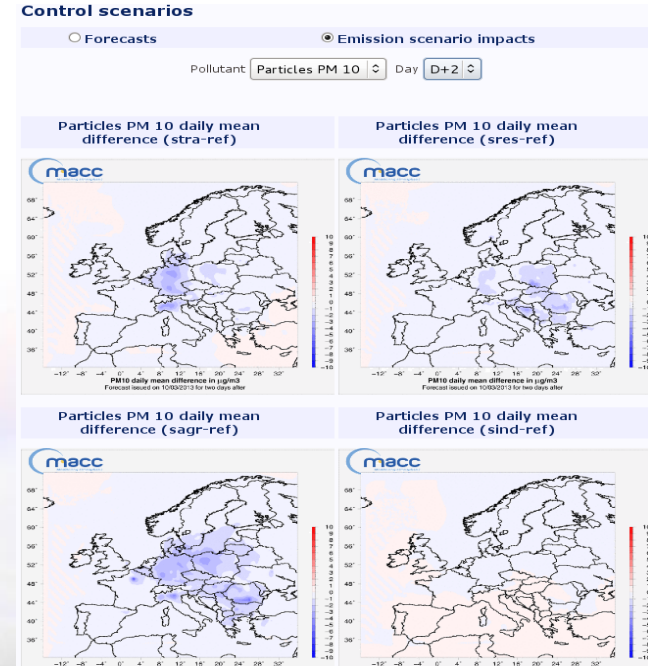

PM10 Model reanalysis
2012 yearlyavg indicator in $\mu\text{g}/\text{m}^3$

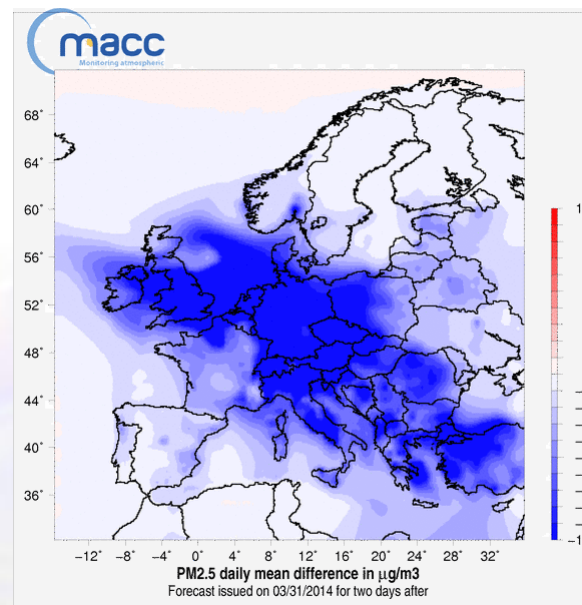

Additional products: Copernicus scenarios

- To help policy users to select the most efficient measure, a toolbox has been developed for visualizing the impact of control emission scenarios on pollutant concentrations (O3, NO2, PM10, PM2.5)

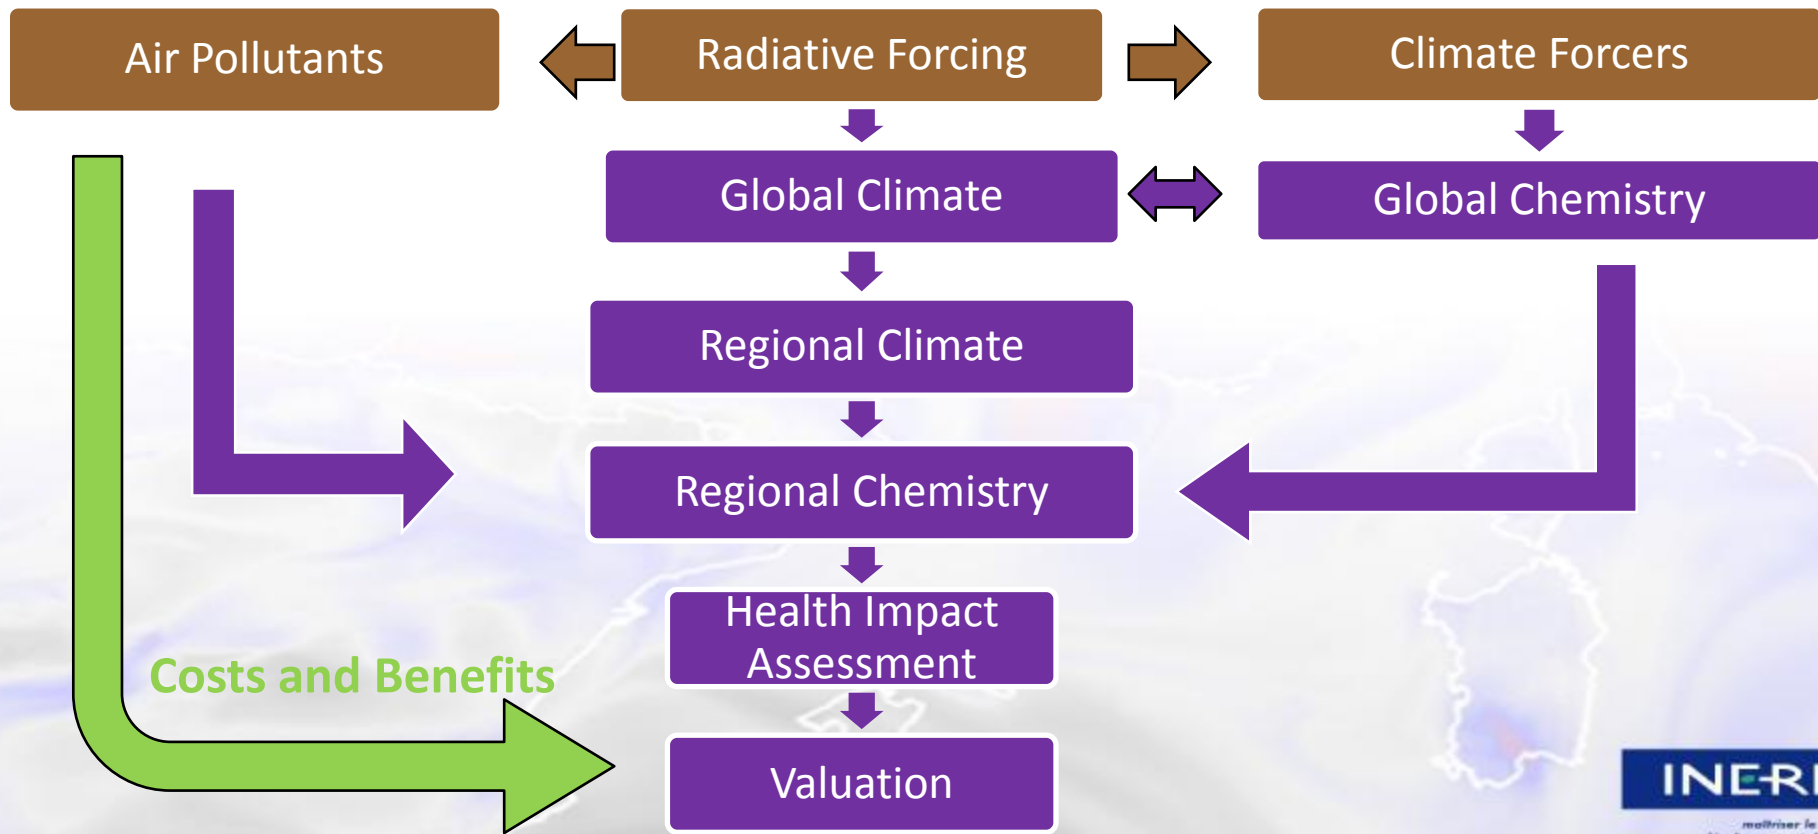

Evolution of the PREV'AIR role in the French air quality management

- To help policy users to select the most efficient measure, a toolbox has been developed for visualizing the impact of Gothenburg scenarios on pollutant concentrations (O₃, NO₂, PM₁₀, PM_{2.5})

Future Air Quality Projections, Health Impacts, Valuation

Emission projections

- The Global Energy Assessment (2012)
- Primary energy consumption in Europe:
 - Same AQ Legislation
 - Different Climate policies

Business as usual

Mitigation

Future Air Quality: SOMO35 (sum of O3max > 35ppb)

Historical

2050 Reference

2050 Mitigation

Difference
%
historical

- Projections: status-quo for the Reference, large decrease for the Mitigation

Air Quality: PM2.5 (annual mean)

Historical

2050 Reference

2050 Mitigation

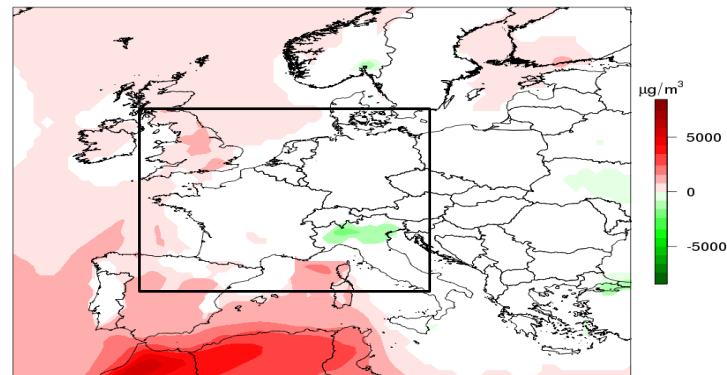

Difference
%
historical

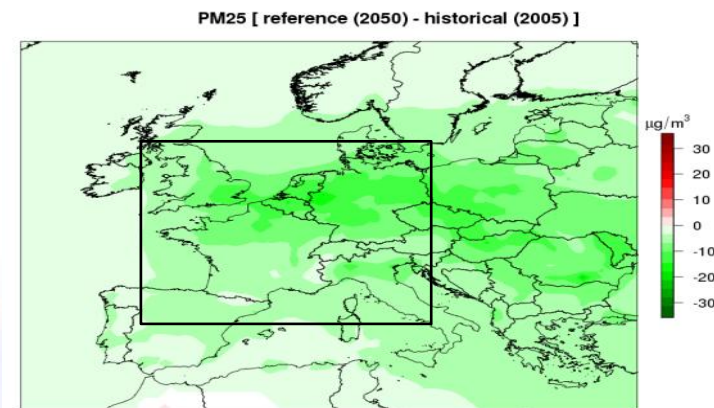

- Projections: significant decrease under both scenarios

decomposition of the external factors: ozone

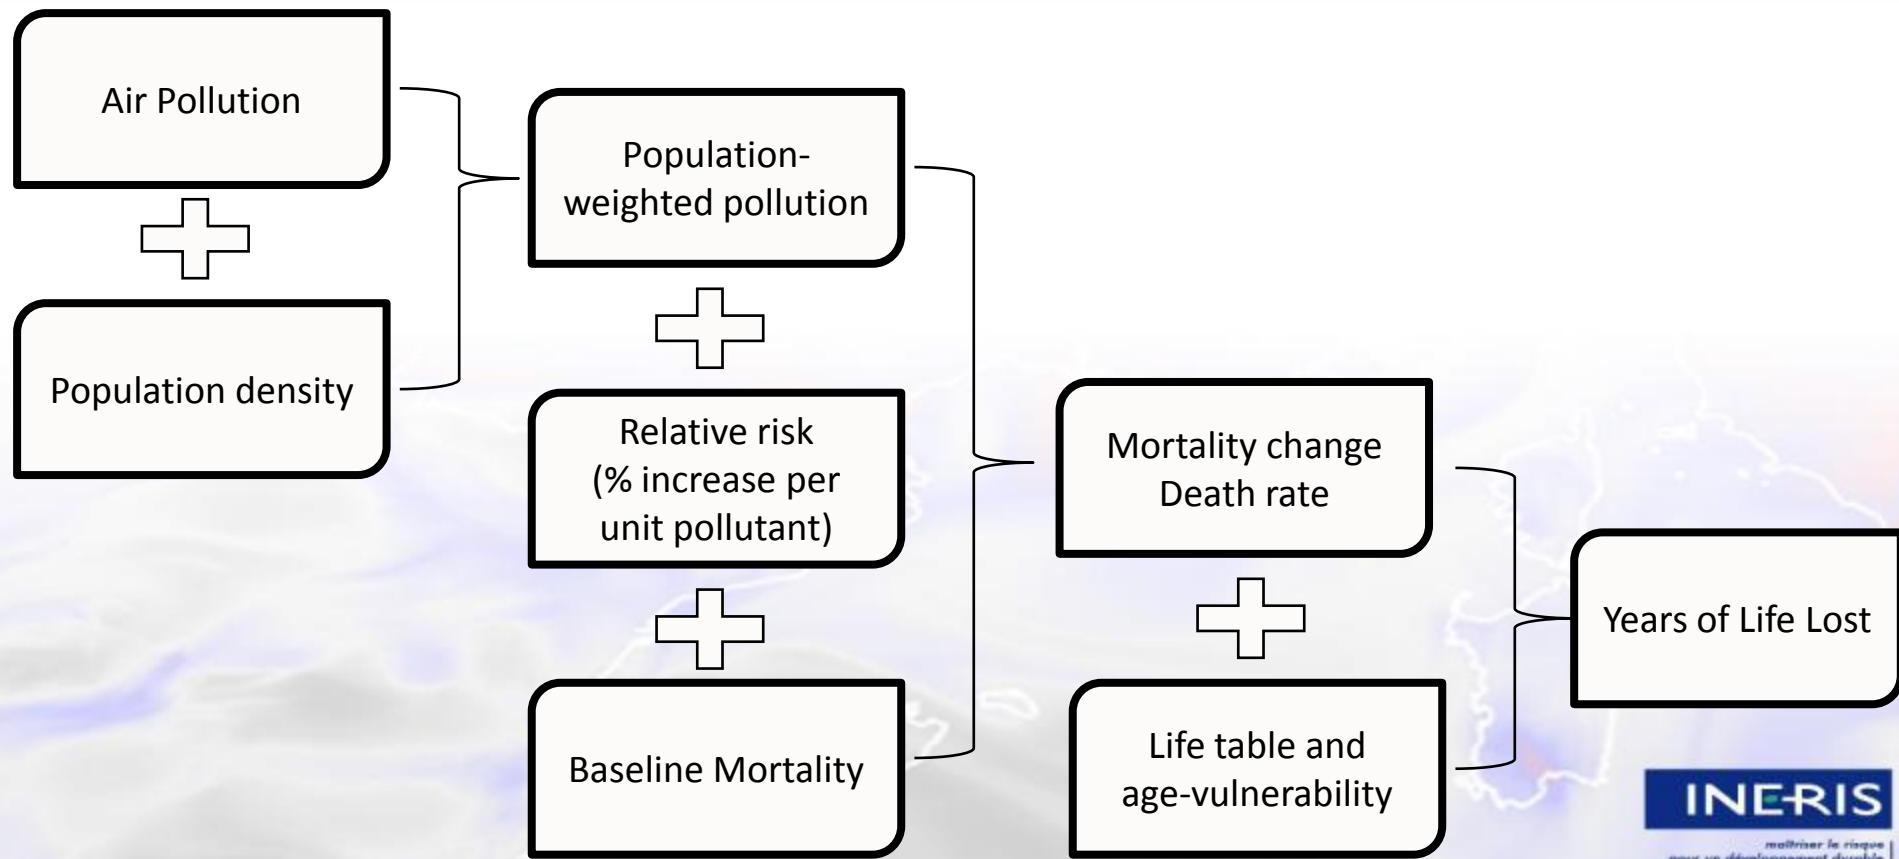

- Climate penalty confirmed
- Major influence of global chemistry
- AQ legislation efficient

decomposition of the external factors: PM

- Climate benefit (but model dependant)
- AQ legislation dominates

Health impact assessment

Health impacts PM & O3

- PM2.5:
 - 5 300 000 life-years are lost in 2005
 - ~ 450 000 premature deaths
 - Decrease in both scenarios
- Ozone
 - 60 000 premature deaths
 - Increase in 2050 under Business as Usual scenario
 - Decrease with climate mitigation

Cost Benefit analysis Synthesis

- The cost of climate mitigation is compensated by
 - Savings in air quality mitigation (less end-of-pipe measures required in low-carbon economy)
 - Reduced health damage

Conclusions

- France has developed a new approach to overcome pollution episodes based on forecast and near real time observations
- Europe has already a solid legislation on air quality even if standards are lower than WHO, and targets are not reached yet
- Monetised cost benefit analyses are a relevant instrument to support mitigation measures
