# Introduction

# Volcanic eruptions

- ▶ SAT cools rapidly over 1-3 years post eruption, then recovers over 6-7 years

Figure: Timmreck, 2012

- ▶ Many studies have investigated link to Pacific Ocean variability
  - ▶ El Niño response, hypothesised due to a dynamical thermostat (*Adams et al 2003; Seager et al 1988, Clement et al 1996; Cane 1997, Mann et al 2005, Ohba et al 2013*)
  - ▶ El Niño followed by La Niña (*McGregor et al 2010*)
  - ▶ El Niño response only with Pinatubo or larger eruptions (*Emile-Geay et al 2008*)
  - ▶ No response (*Hirono 1988; Nicholls 1990; Self et al 1997; Robock 2000; Ding et al 2014*)
- ▶ Influences on the Pacific may then influence SST (El Niño/La Niña associated with warm/cool SST)

At 95% significance level in the multi-volcano mean there is:

- ▶ 20-25% increase in probability of a positive IOD in 6-18 months after eruption
- ▶ 30% chance of El Niño- like response at same time (seen in SSH field)
- ▶ 50% increase in chance of La Niña 18months - 3.5 years after the eruption (in SST field)

Conclusions

Persistent cooling

# Conclusions

1. Large tropical eruptions consistently result in cooling in the CMIP5 models
2. Large tropical eruptions cause a increase in probability of the following sequence of events
  - ▶ Positive IOD and El Niño-like event in the austral spring/summer post eruption
  - ▶ La Niña in the third austral summer after the eruption
  - ▶ Increased persistence of volcanic cooling due to La Niña state of the ocean

## Thank you for your attention!

- ▶ *Maher, N., McGregor, S., England, M. H, and Sen Gupta, A. (2015), Effects of volcanism on tropical variability, Geophys. Res. Lett., 42, 6024 - 6033*

- ▶ Do the results differ if we subset for models that represent ENSO well?
  - ▶ Kim et al. [2014] have used ENSO magnitude to subset the best 9 CMIP5 models
  - ▶ These models have a noticeably reduced cold tongue bias when compared to the remaining models
  - ▶ We find no difference in result when subsetting for the best 7 models
- ▶ Does it matter which forcing dataset is used?
  - ▶ Each model uses one of the following volcanic forcing datasets: Sato et al. [1993], Ammann et al. [2003], Ammann et al. [2007], Stenchikov et al. [1998] or Andres and Kasgnoc [1998]
  - ▶ Different models also treat volcanic aerosols differently
