“Feynman-Field  
Jet Model”

My 1<sup>st</sup> graduate  
student!

# Hadron-Hadron Collisions

FF1 1977

- ➔ What happens when two hadrons collide at high energy?
- ➔ Most of the time the hadrons ooze through each other and fall apart (*i.e.* **no hard scattering**). The outgoing particles continue in roughly the same direction as initial proton and antiproton.
- ➔ Occasionally there will be a **large transverse momentum meson**.  
Question: Where did it come from?
- ➔ We assumed it came from quark-quark elastic scattering, but we did not know how to calculate it!

“Black-Box Model”

# Hadron-Hadron Collisions

FF1 1977

➔ What happens when  
collide at high energy

➔ Most of the time the  
through each other  
**no hard scattering**)  
particles continue in  
direction as initial  
antiproton.

➔ Occasionally the  
**transverse momentum meson**

Question: Where did it come from?

➔ We assumed it came from quark-quark  
elastic scattering, but we did not know  
how to calculate it!

Feynman quote from FF1  
“The model we shall choose is not a popular one,  
so that we will not duplicate too much of the  
work of others who are similarly analyzing  
various models (e.g. constituent interchange  
model, multiperipheral models, etc.). We shall  
assume that the high  $P_T$  particles arise from  
direct hard collisions between constituent  
quarks in the incoming particles, which  
fragment or cascade down into several hadrons.”

# Traditional Approach

## CDF Run 1 Analysis Charged Particle $\Delta\phi$ Correlations

Charged Jet #1

$$P_T > P_{T_{\min}} \quad |\eta| < \eta_{\text{cut}}$$

“Transverse” region very sensitive to the “underlying event”!

- ➡ Look at charged particle correlations in the azimuthal angle  $\Delta\phi$  relative to a leading object (*i.e.* CaloJet#1, ChgJet#1,  $P_{T\text{max}}$ , Z-boson). For CDF  $P_{T\text{min}} = 0.5 \text{ GeV}/c$   $\eta_{\text{cut}} = 1.0$  or  $0.8$ .
- ➡ Define  $|\Delta\phi| < 60^\circ$  as “Toward”,  $60^\circ < |\Delta\phi| < 120^\circ$  as “Transverse”, and  $|\Delta\phi| > 120^\circ$  as “Away”.
- ➡ All three regions have the same area in  $\eta$ - $\phi$  space,  $\Delta\eta \times \Delta\phi = 2\eta_{\text{cut}} \times 120^\circ = 2\eta_{\text{cut}} \times 2\pi/3$ . Construct densities by dividing by the area in  $\eta$ - $\phi$  space.

# ISAJET 7.32 (without MPI)

## “Transverse” Density

Beam-Beam  
Remnants

ISAJET uses a naïve leading-log parton shower-model which does not agree with the data!

ISAJET

“Hard”  
Component

- ➔ Plot shows average “transverse” charge particle density ( $|\eta| < 1$ ,  $p_T > 0.5$  GeV) versus  $P_T$ (charged jet#1) compared to the QCD hard scattering predictions of ISAJET 7.32 (default parameters with  $P_T(\text{hard}) > 3$  GeV/c).
- ➔ The predictions of ISAJET are divided into two categories: charged particles that arise from the break-up of the beam and target (**beam-beam remnants**); and charged particles that arise from the outgoing jet plus initial and final-state radiation (**hard scattering component**).

# HERWIG 6.4 (without MPI)

## “Transverse” Density

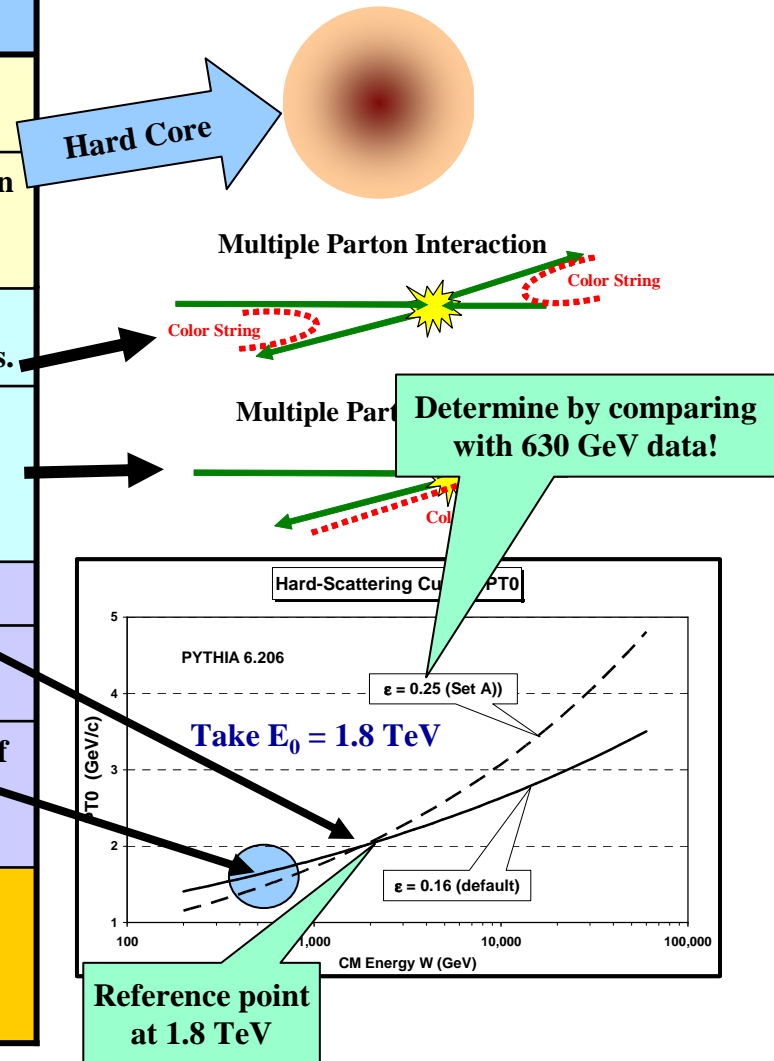

- ➔ Plot shows average “transverse” charge particle density ( $|\eta| < 1$ ,  $p_T > 0.5$  GeV) versus  $P_T$ (charged jet#1) compared to the QCD hard scattering predictions of **HERWIG 5.9** (default parameters with  $P_T(\text{hard}) > 3$  GeV/c without MPI).
- ➔ The predictions of HERWIG are divided into two categories: charged particles that arise from the break-up of the beam and target (**beam-beam remnants**); and charged particles that arise from the outgoing jet plus initial and final-state radiation (**hard scattering component**).

# Tuning PYTHIA 6.2: Multiple Parton Interaction Parameters

Parameter	Default	Description
PARP(83)	0.5	Double-Gaussian: Fraction of total hadronic matter within PARP(84)
PARP(84)	0.2	Double-Gaussian: Fraction of the overall hadron radius containing the fraction PARP(83) of the total hadronic matter
PARP(85)	0.33	Determines the energy dependence of the MPI! Produces two gluons w nearest neighbors.
PARP(86)	0.66	Affects the amount of initial-state radiation! Produces two gluons w nearest neighbors.
PARP(89)	1 TeV	Determines reference energy $E_0$ .
PARP(82)	2.9 GeV/c	The cut-off $P_{T0}$ that regulates the 2-to-2 scattering divergence $1/PT^4 \rightarrow 1/(PT^2 + P_{T0}^2)^2$
PARP(90)	0.16	Determines the energy dependence of the cut-off $P_{T0}$ as follows $P_{T0}(E_{cm}) = P_{T0}(E_{cm}/E_0)^\epsilon$ with $\epsilon = \text{PARP}(90)$
PARP(67)	1.0	A scale factor that determines the maximum parton virtuality for space-like showers. The larger the value of PARP(67) the more initial-state radiation.

# PYTHIA 6.206 Defaults

**PYTHIA default parameters**

Parameter	6.115	6.125	6.158	6.206

## DiJet: Charged Multiplicity versus $P_T(\text{chgjet\#1})$

Underlying event "plateau"

Refer to the Min-Bias + JET20 data as the "dijet" data.

- ⇒ Dijet data on the average number of "toward" ( $|\Delta\phi| < 60^\circ$ ), "transverse" ( $60^\circ < |\Delta\phi| < 120^\circ$ ), and "away" ( $|\Delta\phi| > 120^\circ$ ) charged particles ( $P_T > 0.5$  GeV,  $|\eta| < 1$ , including jet#1) as a function of the transverse momentum of the leading charged particle jet. Each point corresponds to the  $\langle N_{\text{chg}} \rangle$  in a 1 GeV bin. The open (filled) points are the Min-Bias (JET20) data. The errors on the (uncorrected) data include statistical and correlated systematic uncertainties.

DPF2000

Rick Field - Florida/CDF

Page 35

## The Underlying Event: Summary & Conclusions

The "Underlying Event"

- ⇒ The underlying event is very similar in dijet and the Z-boson production as predicted by the QCD Monte-Carlo models. The "toward" region in Z-boson production is a direct measure of the underlying event.
- ⇒ The number of charged particles per unit rapidity (height of the "plateau") is at least twice that observed in "soft" collisions at the same corresponding energy.
- ⇒ None of the QCD Monte-Carlo models correctly describe the underlying event. Herwig and Pythia 6.125 do not have enough activity in the underlying event. Pythia 6.115 has about the right amount of activity in the underlying event, but as a result produces too much overall multiplicity. Isajet has a lot of activity in the underlying event, but with the wrong dependence on  $P_T(\text{jet\#1})$  or  $P_T(Z)$ . None of the Monte-carlo models have the correct  $P_T$  dependence of the beam-beam remnant component of the underlying event.

## The Underlying Event in Hard Scattering Processes

**The Underlying Event:**  
beam-beam remnants  
initial-state radiation

## The “Underlying Event” in Hard Scattering Processes

What happens when a proton and an antiproton collide with a center-of-mass energy of 2 TeV?

Most of the time the proton and antiproton ooze through each other and fall apart (*i.e.* **no hard scattering**). The outgoing particles continue in roughly the same direction as initial proton and antiproton.

Occasionally there will be a **“hard” parton-parton collision** resulting in large transverse momentum outgoing partons.

The **“underlying event”** is everything except the two outgoing hard scattered “jets”. It is an **unavoidable background** to many collider observables.

Cambridge Workshop  
July 20, 2002

## The Underlying Event in Hard Scattering Processes

The Underlying Event:  
beam-beam remnants  
initial-state radiation

## The “Underlying Event” in Hard Scattering Processes

## The “Underlying Event” in Run 2 at CDF

### CERN MC4LHC Workshop

July 2003

During the workshop the theorists, ATLAS/CMS experimenters, and I constructed a “wish list” of data from CDF relating to “min-bias” and the “underlying event” and I promised to do the analysis and make the data available.

The “underlying event” consists of hard initial & final-state radiation plus the “beam-beam remnants” and possible multiple parton interactions.

### New CDF Run 2 results!

- Two Classes of Events: “Leading Jet” and “Back-to-Back”.
- Two “Transverse” regions: “transMAX”, “transMIN”, “transDIF”.
- $PT_{max}$  and  $PT_{maxT}$  distributions and averages.
- $\Delta\phi$  Distributions: “Density” and “Associated Density”.
- $\langle p_T \rangle$  versus charged multiplicity: “min-bias” and the “transverse” region.
- Correlations between the two “transverse” regions: “trans1” vs “trans2”.

# KITP Collider Workshop 2004

## A Closer Look at the Underlying Event in Run 2

### CERN MC4LHC Workshop

July 2003

During the workshop the theorists, ATLAS/CMS experimenters, and I constructed a “wish list” of data from CDF relating to “min-bias” and the “underlying event” and I promised to do the analysis and have the data available by the time of the Santa Barbara workshop in February 2004.

The “underlying event” consists of hard initial & final-state radiation plus the “beam-beam remnants” and possible multiple parton interactions.

### New CDF Run 2 results!

- ➔ Two Classes of Events: “Leading Jet” and “Back-to-Back”.
- ➔ Two “Transverse” regions: “transMAX”, “transMIN”, “transDIF”.
- ➔  $PT_{max}$  and  $PT_{maxT}$  distributions and averages.
- ➔  $\Delta\phi$  Distributions: “Density” and “Associated Density”.
- ➔  $\langle p_T \rangle$  versus charged multiplicity: “min-bias” and the “transverse” region.
- ➔ Correlations between the two “transverse” regions: “trans1” vs “trans2”.

Rick Field - Florida/CDF

Page 1

# “Transverse” Particle Densities

- ➡ Study the charged particles ( $p_T > 0.5 \text{ GeV}/c$ ,  $|\eta| < 1$ ) in the “Transverse 1” and “Transverse 2” and form the charged particle density,  $dN_{\text{chg}}/d\eta d\phi$ , and the charged scalar  $p_T$  sum density,  $dP_{T\text{sum}}/d\eta d\phi$ .
- ➡ The average “transverse” density is the average of “transverse 1” and “transverse 2”.

# Charged Particle Density $\Delta\phi$ Dependence

- ➡ Shows the  $\Delta\phi$  dependence of the charged particle density,  $dN_{\text{chg}}/d\eta d\phi$ , for charged particles in the range  $p_T > 0.5$  GeV/c and  $|\eta| < 1$  relative to jet#1 (rotated to 270°) for "leading jet" events  $30 < E_T(\text{jet\#1}) < 70$  GeV.
- ➡ Also shows charged particle density,  $dN_{\text{chg}}/d\eta d\phi$ , for charged particles in the range  $p_T > 0.5$  GeV/c and  $|\eta| < 1$  for "min-bias" collisions.

# Charged Particle Density $\Delta\phi$ Dependence

- ➡ Shows the  $\Delta\phi$  dependence of the charged particle density,  $dN_{\text{chg}}/d\eta d\phi$ , for charged particles in the range  $p_T > 0.5$  GeV/c and  $|\eta| < 1$  relative to jet#1 (rotated to 270°) for "leading jet" events  $30 < E_T(\text{jet\#1}) < 70$  GeV.
- ➡ Also shows charged particle density,  $dN_{\text{chg}}/d\eta d\phi$ , for charged particles in the range  $p_T > 0.5$  GeV/c and  $|\eta| < 1$  for "min-bias" collisions.

# Charged Particle Density $\Delta\phi$ Dependence

- ➔ Look at the **"transverse" region** as defined by the leading jet (JetClu  $R = 0.7$ ,  $|\eta| < 2$ ) or by the leading two jets (JetClu  $R = 0.7$ ,  $|\eta| < 2$ ). **"Back-to-Back"** events are selected to have at least two jets with Jet#1 and Jet#2 nearly "back-to-back" ( $\Delta\phi_{12} > 150^\circ$ ) with almost equal transverse energies ( $E_T(\text{jet}\#2)/E_T(\text{jet}\#1) > 0.8$ ).
- ➔ Shows the  $\Delta\phi$  dependence of the charged particle density,  $dN_{\text{chg}}/d\eta d\phi$ , for charged particles in the range  $p_T > 0.5 \text{ GeV/c}$  and  $|\eta| < 1$  relative to jet#1 (rotated to  $270^\circ$ ) for  $30 < E_T(\text{jet}\#1) < 70 \text{ GeV}$  for **"Leading Jet"** and **"Back-to-Back"** events.

# Charged Particle Density $\Delta\phi$ Dependence

- ➔ Shows the  $\Delta\phi$  dependence of the charged particle density,  $dN_{\text{chg}}/d\eta d\phi$ , for charged particles in the range  $p_T > 0.5$  GeV/c and  $|\eta| < 1$  relative to jet#1 (rotated to  $270^\circ$ ) for  $30 < E_T(\text{jet\#1}) < 70$  GeV for "Leading Jet" and "Back-to-Back" events.

# “Transverse” PTsum Density PYTHIA Tune A vs HERWIG

- ➔ Shows the **average charged PTsum density**,  $dPT_{\text{sum}}/d\eta d\phi$ , in the “**transverse**” region ( $p_T > 0.5$  GeV/c,  $|\eta| < 1$ ) versus  $E_T(\text{jet\#1})$  for “**Leading Jet**” and “**Back-to-Back**” events.
- ➔ Compares the (*uncorrected*) data with **PYTHIA Tune A** and **HERWIG (no MPI)** after CDFSIM.

# Charged PTsum Density PYTHIA Tune A vs HERWIG

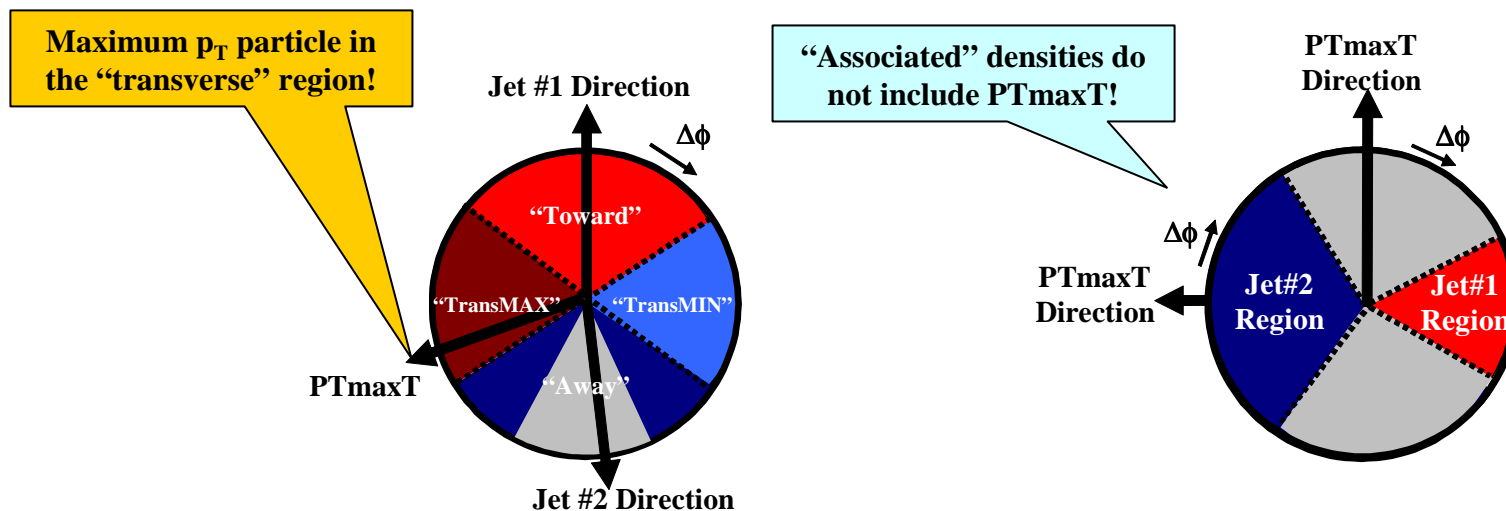

# Charged PTsum Density PYTHIA Tune A vs HERWIG

HERWIG (without multiple parton interactions) does not produce enough PTsum in the “transverse” region for  $30 < E_T(\text{jet\#1}) < 70 \text{ GeV}$ !

# Back-to-Back “Associated” Charged Particle Densities

- ➡ Use the leading jet in “back-to-back” events to define the “transverse” region and look at the **maximum  $p_T$  charged particle in the “transverse” region,  $PT_{maxT}$** .
- ➡ Look at the  $\Delta\phi$  dependence of the “associated” charged particle and  $PT_{sum}$  densities,  $dN_{chg}/d\eta d\phi$  and  $dPT_{sum}/d\eta d\phi$  for charged particles ( $p_T > 0.5$  GeV/c,  $|\eta| < 1$ , *not including  $PT_{maxT}$* ) relative to  $PT_{maxT}$ .
- ➡ Rotate so that  $PT_{maxT}$  is at the center of the plot (*i.e.*  $180^\circ$ ).

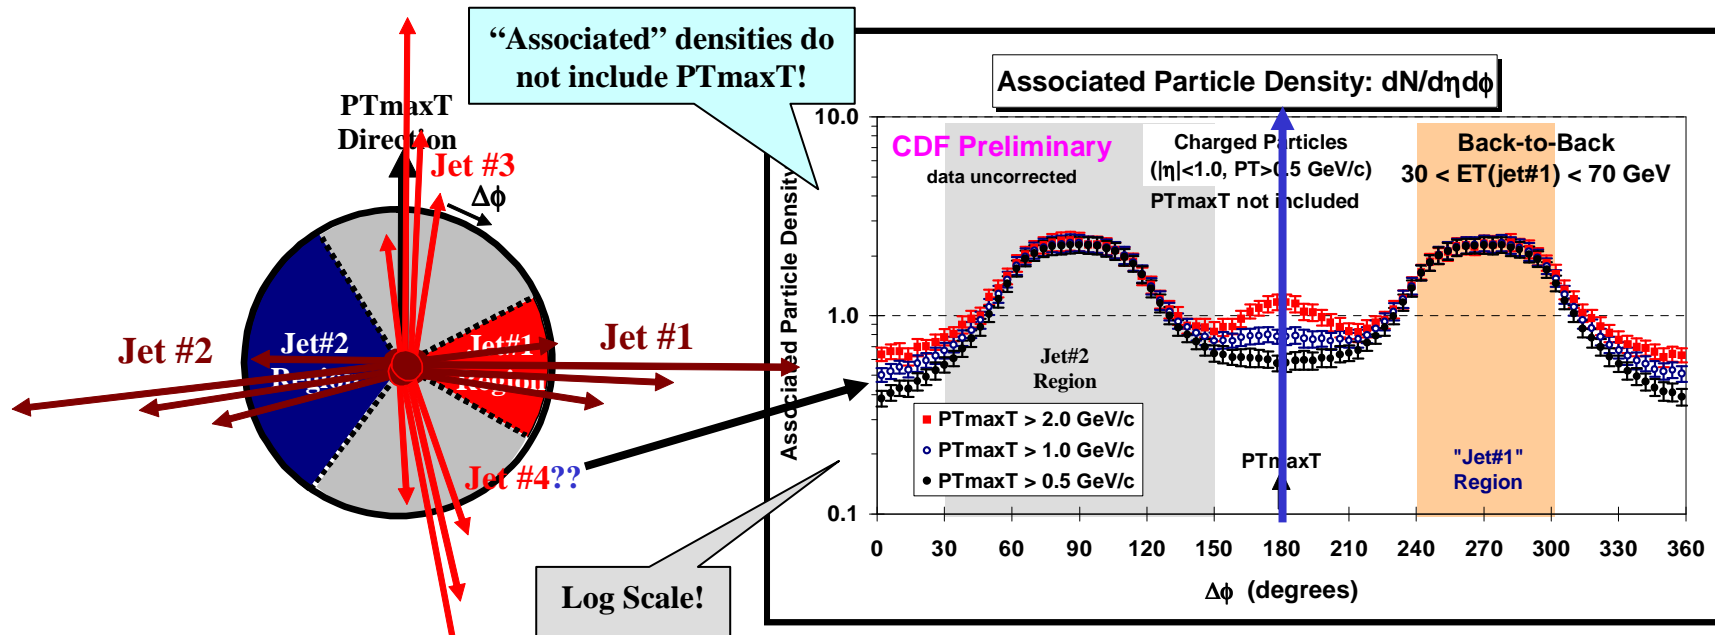

# Back-to-Back “Associated” Charged Particle Density

- ➔ Look at the  $\Delta\phi$  dependence of the “associated” charged particle density,  $dN_{\text{chg}}/d\eta d\phi$  for charged particles ( $p_T > 0.5 \text{ GeV}/c$ ,  $|\eta| < 1$ , *not including*  $PT_{\text{maxT}}$ ) relative to  $PT_{\text{maxT}}$  (rotated to  $180^\circ$ ) for  $PT_{\text{maxT}} > 0.5 \text{ GeV}/c$ ,  $PT_{\text{maxT}} > 1.0 \text{ GeV}/c$  and  $PT_{\text{maxT}} > 2.0 \text{ GeV}/c$ , for “back-to-back” events with  $30 < E_T(\text{jet\#1}) < 70 \text{ GeV}$ .
- ➔ Shows “jet structure” in the “transverse” region (*i.e.* the “birth” of the 3<sup>rd</sup> & 4<sup>th</sup> jet).

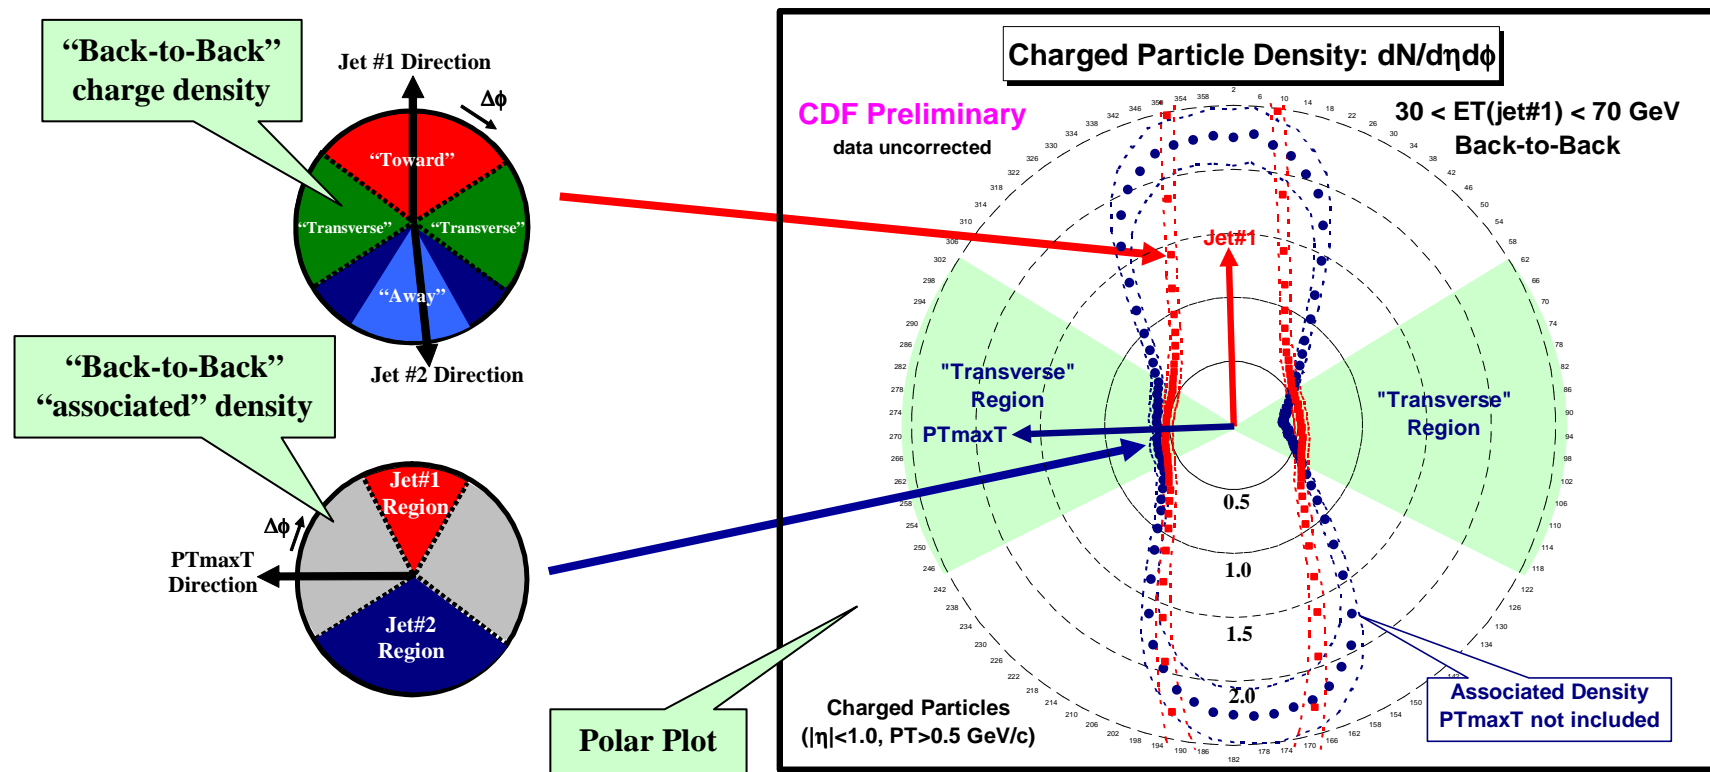

# Back-to-Back “Associated” Charged Particle Density

- ➡ Look at the  $\Delta\phi$  dependence of the “associated” charged particle density,  $dN_{chg}/d\eta d\phi$  for charged particles ( $p_T > 0.5$  GeV/c,  $|\eta| < 1$ , *not including*  $PT_{maxT}$ ) relative to  $PT_{maxT}$  (rotated to  $180^\circ$ ) for  $PT_{maxT} > 0.5$  GeV/c,  $PT_{maxT} > 1.0$  GeV/c and  $PT_{maxT} > 2.0$  GeV/c, for “back-to-back” events with  $30 < E_T(\text{jet\#1}) < 70$  GeV.
- ➡ Shows “jet structure” in the “transverse” region (*i.e.* the “birth” of the 3<sup>rd</sup> & 4<sup>th</sup> jet).

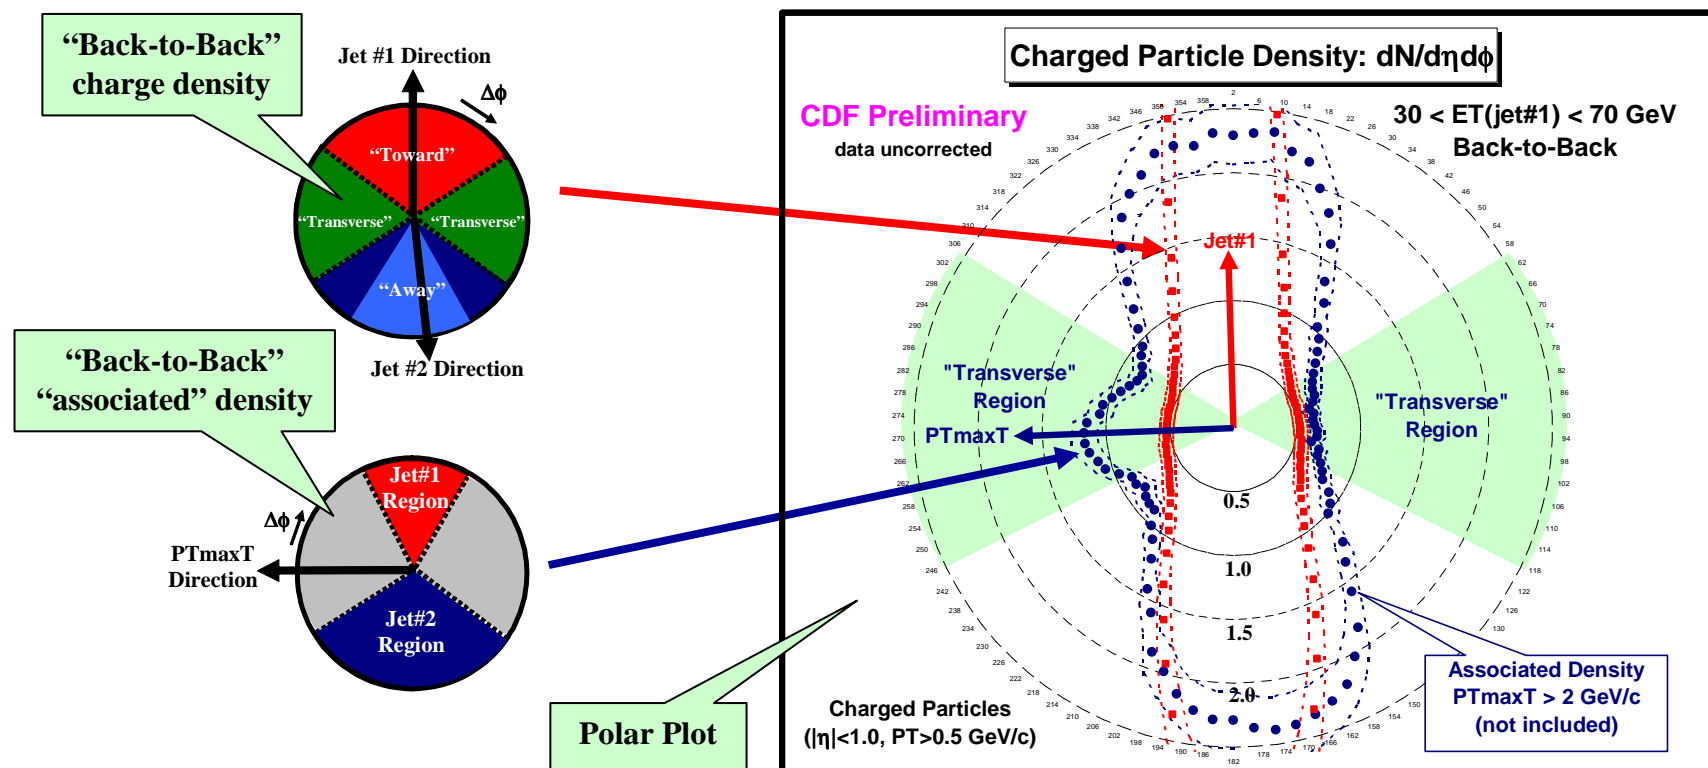

# Back-to-Back “Associated” Charged Particle Densities

➔ Shows the  $\Delta\phi$  dependence of the “associated” charged particle density,  $dN_{\text{chg}}/d\eta d\phi$ ,  $p_T > 0.5 \text{ GeV/c}$ ,  $|\eta| < 1$  (not including  $PT_{\text{maxT}}$ ) relative to  $PT_{\text{maxT}}$  (rotated to  $180^\circ$ ) and the charged particle density,  $dN_{\text{chg}}/d\eta d\phi$ ,  $p_T > 0.5 \text{ GeV/c}$ ,  $|\eta| < 1$  relative to jet#1 (rotated to  $270^\circ$ ) for “back-to-back events” with  $30 < E_T(\text{jet}\#1) < 70 \text{ GeV}$ .

# Back-to-Back “Associated” Charged Particle Densities

- ➡ Shows the  $\Delta\phi$  dependence of the “associated” charged particle density,  $dN_{\text{chg}}/d\eta d\phi$ ,  $p_T > 0.5 \text{ GeV/c}$ ,  $|\eta| < 1$ ,  $PT_{maxT} > 2.0 \text{ GeV/c}$  (not including  $PT_{maxT}$ ) relative to  $PT_{maxT}$  (rotated to  $180^\circ$ ) and the charged particle density,  $dN_{\text{chg}}/d\eta d\phi$ ,  $p_T > 0.5 \text{ GeV/c}$ ,  $|\eta| < 1$ , relative to jet#1 (rotated to  $270^\circ$ ) for “back-to-back events” with  $30 < E_T(\text{jet\#1}) < 70 \text{ GeV}$ .

# Back-to-Back “Associated” Charged Particle Density

Log Scale!

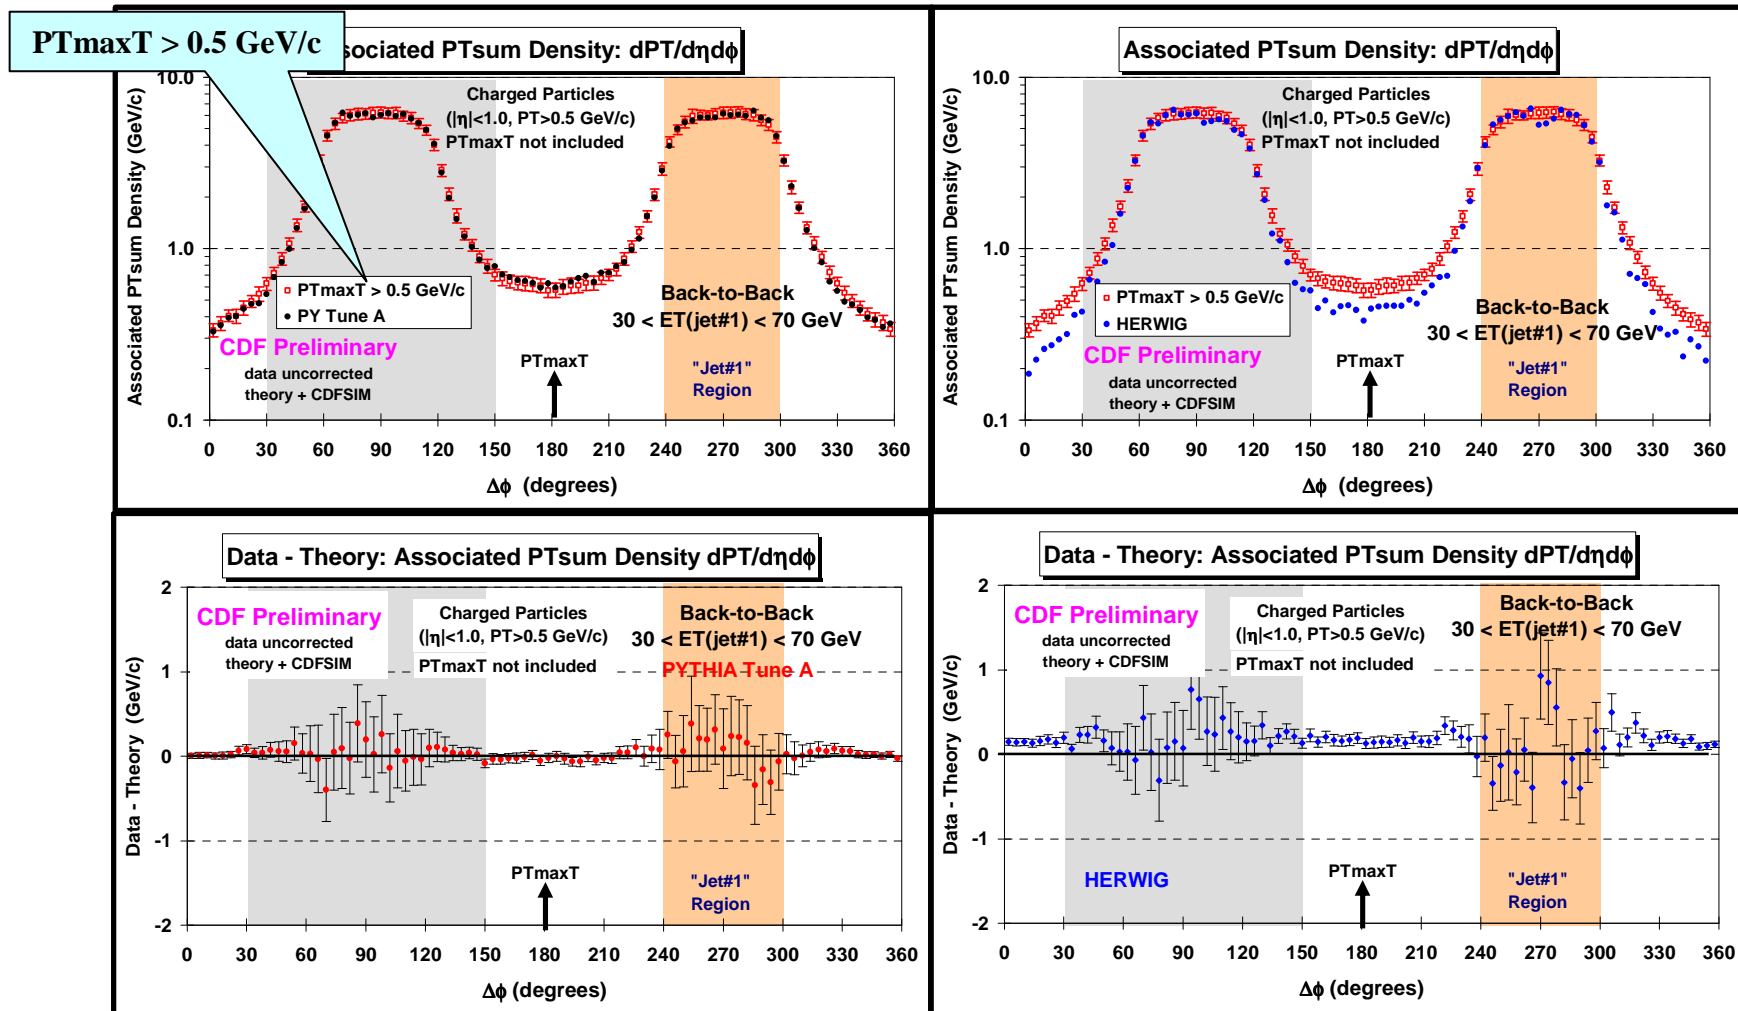

➡ Look at the  $\Delta\phi$  dependence of the “associated” charged particle density,  $dN_{\text{chg}}/d\eta d\phi$ ,  $p_T > 0.5$  GeV/c,  $|\eta| < 1$  (not including  $PT_{\text{maxT}}$ ) relative to  $PT_{\text{maxT}}$  (rotated to  $180^\circ$ ) for  $PT_{\text{maxT}} > 2.0$  GeV/c for “back-to-back” events with  $30 < E_T(\text{jet\#1}) < 70$  GeV and  $95 < E_T(\text{jet\#1}) < 130$  GeV.

➡ Very little dependence on  $E_T(\text{jet\#1})$  in the “transverse” region for “back-to-back” events!

# “Associated” PTsum Density PYTHIA Tune A vs HERWIG

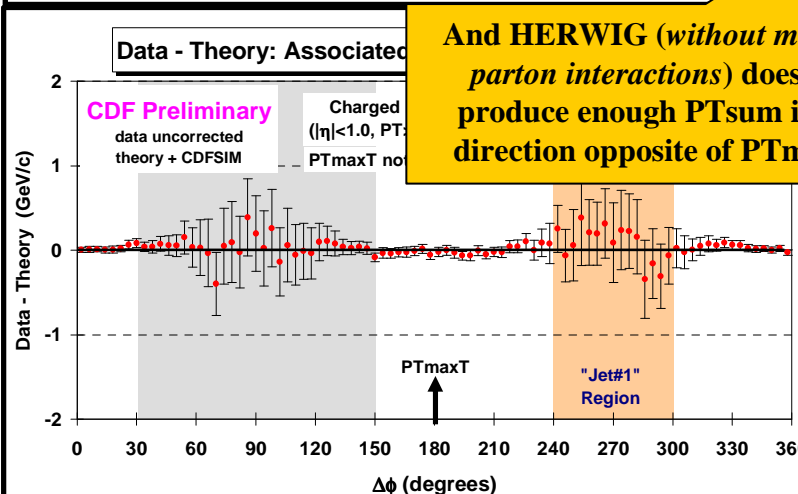

# “Associated” PTsum Density PYTHIA Tune A vs HERWIG

HERWIG (without multiple parton interactions) does not produce enough “associated” PTsum in the direction of PTmaxT!

PTmaxT > 0.5 GeV/c

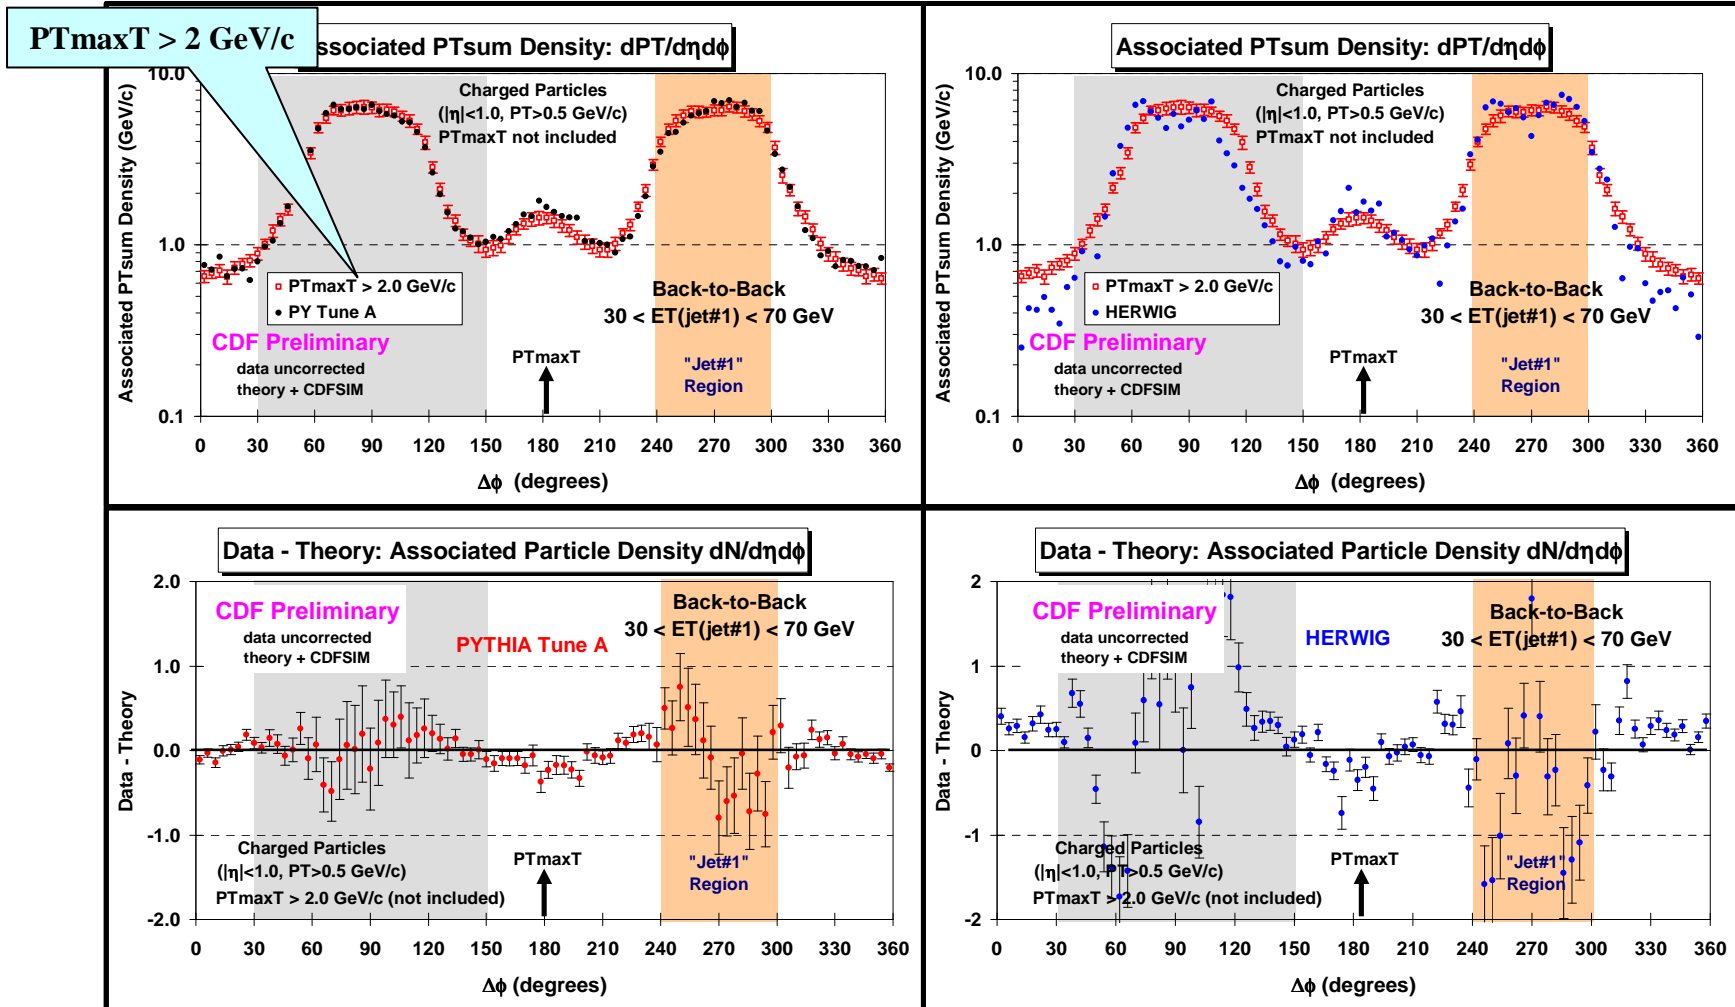

And HERWIG (without multiple parton interactions) does not produce enough PTsum in the direction opposite of PTmaxT!

# “Associated” PTsum Density PYTHIA Tune A vs HERWIG

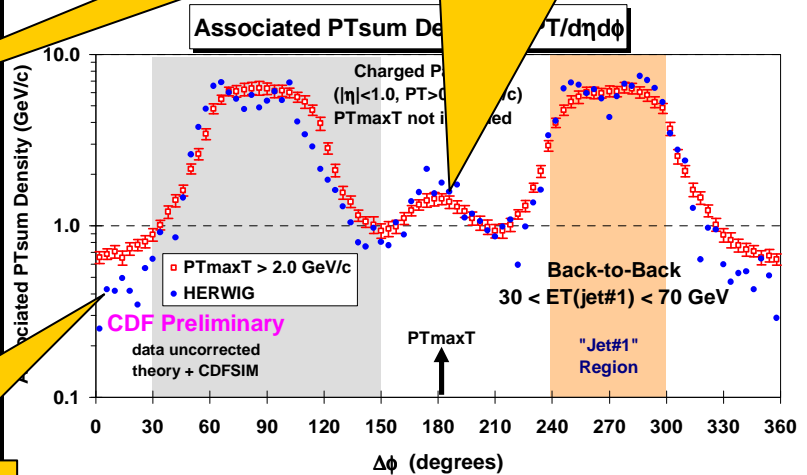

# “Associated” PTsum D

## PYTHIA Tune A vs HERWIG

For  $PT_{maxT} > 2.0$  GeV both PYTHIA and HERWIG produce slightly too much “associated” PTsum in the direction of  $PT_{maxT}$ !

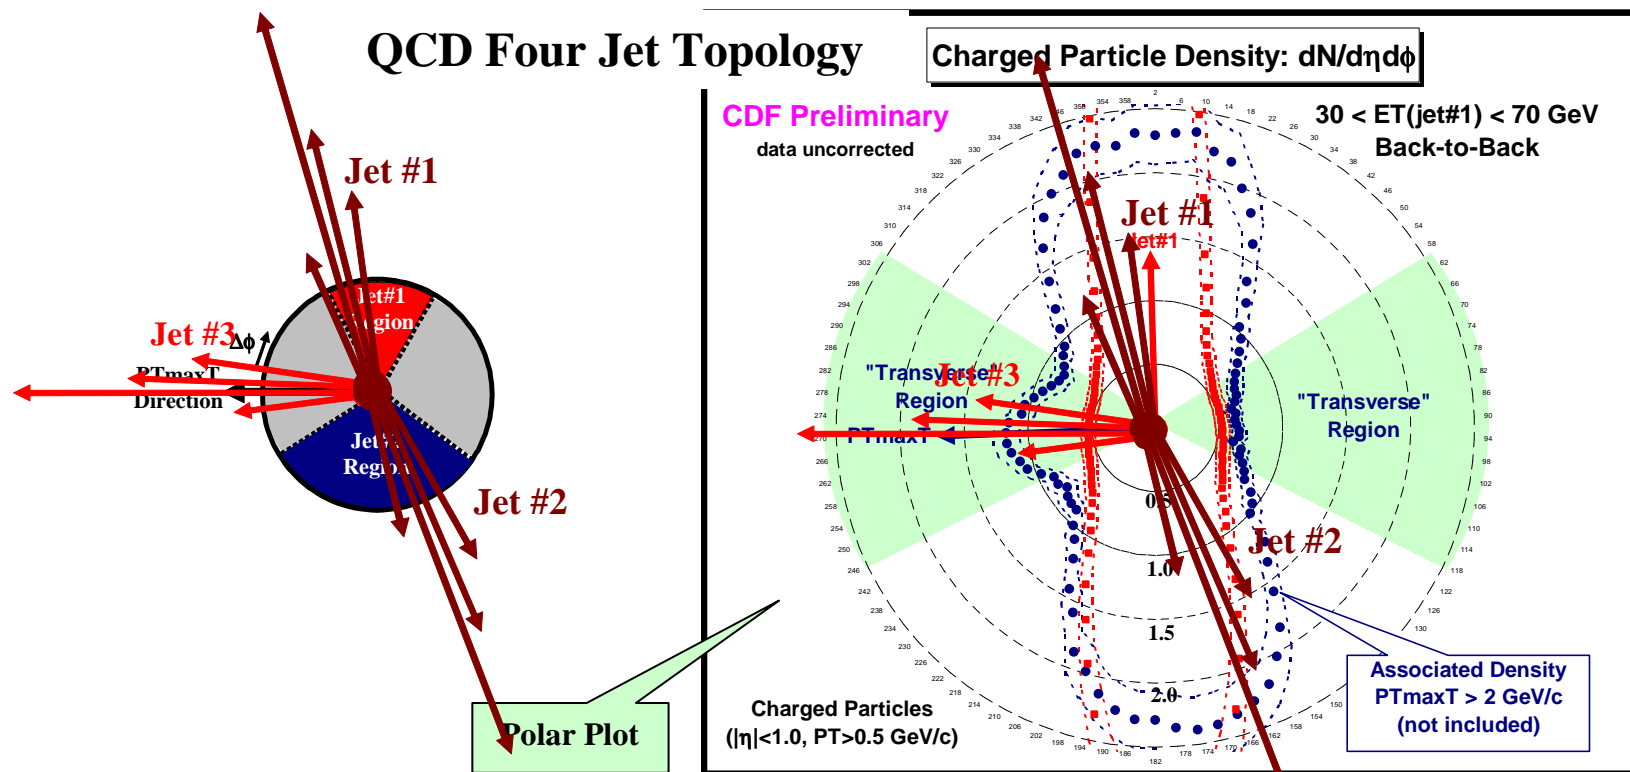

$PT_{maxT} > 2$  GeV/c

But HERWIG (without multiple parton interactions) produces too few particles in the direction opposite of  $PT_{maxT}$ !

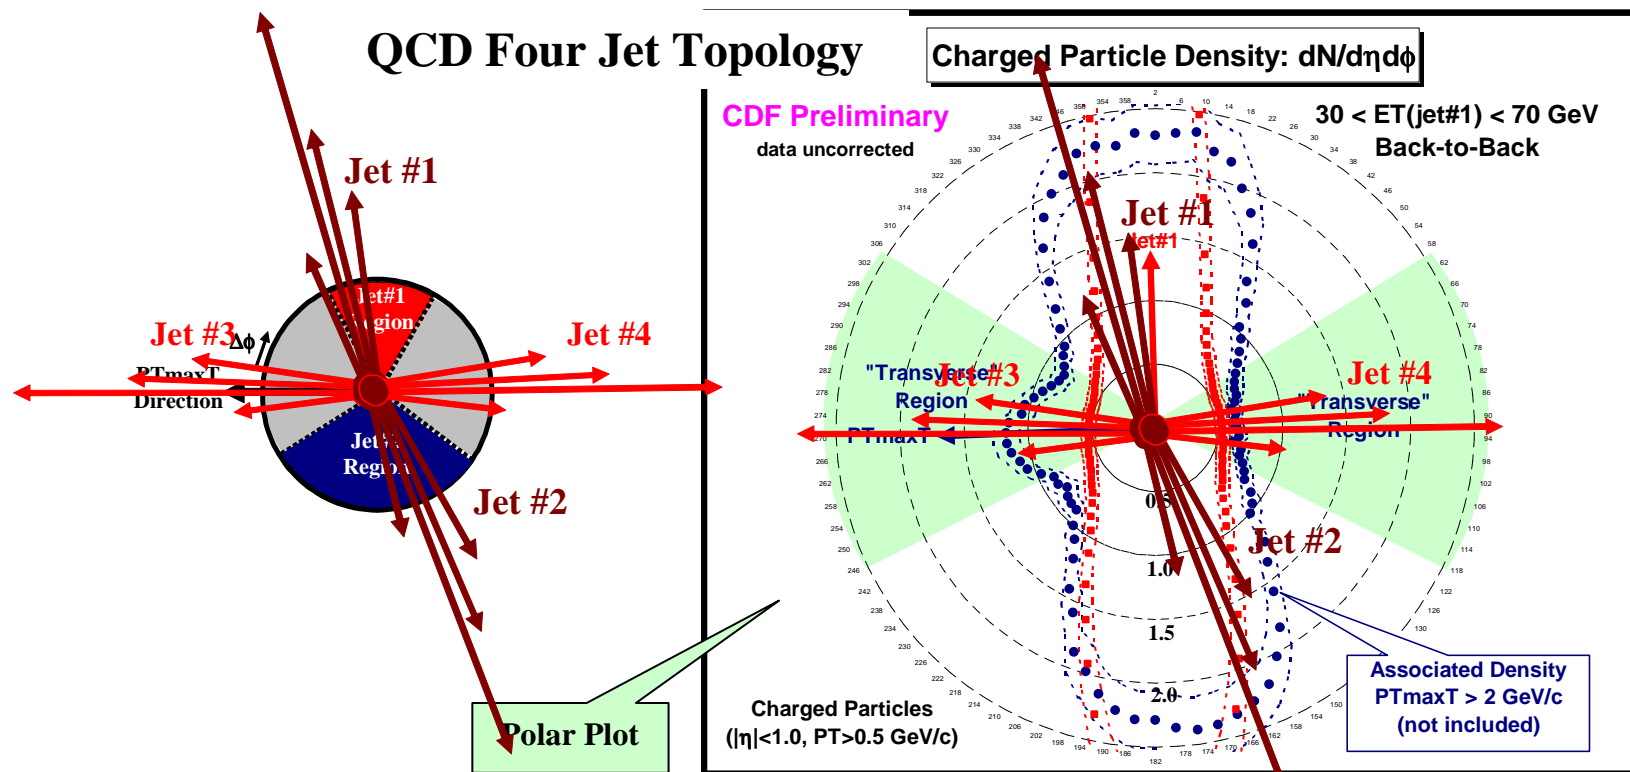

# Jet Topologies

- ➡ Shows the  $\Delta\phi$  dependence of the “associated” charged particle density,  $dN_{chg}/d\eta d\phi$ ,  $p_T > 0.5 \text{ GeV/c}$ ,  $|\eta| < 1$ ,  $PT_{maxT} > 2.0 \text{ GeV/c}$  (not including  $PT_{maxT}$ ) relative to  $PT_{maxT}$  (rotated to  $180^\circ$ ) and the charged particle density,  $dN_{chg}/d\eta d\phi$ ,  $p_T > 0.5 \text{ GeV/c}$ ,  $|\eta| < 1$ , relative to jet#1 (rotated to  $270^\circ$ ) for “back-to-back events” with  $30 < E_T(\text{jet}\#1) < 70 \text{ GeV}$ .

# Jet Topologies

- ➡ Shows the  $\Delta\phi$  dependence of the “associated” charged particle density,  $dN_{\text{chg}}/d\eta d\phi$ ,  $p_T > 0.5 \text{ GeV/c}$ ,  $|\eta| < 1$ ,  $PT_{\text{maxT}} > 2.0 \text{ GeV/c}$  (not including  $PT_{\text{maxT}}$ ) relative to  $PT_{\text{maxT}}$  (rotated to  $180^\circ$ ) and the charged particle density,  $dN_{\text{chg}}/d\eta d\phi$ ,  $p_T > 0.5 \text{ GeV/c}$ ,  $|\eta| < 1$ , relative to jet#1 (rotated to  $270^\circ$ ) for “back-to-back events” with  $30 < E_T(\text{jet}\#1) < 70 \text{ GeV}$ .

# Jet Multiplicity

- ➡ Shows the data on the **number of jets** (JetClu,  $R = 0.7$ ,  $|\eta| < 2$ ,  $E_T(\text{jet}) > 3 \text{ GeV}$ ) for “**back-to-back**” events with  $30 < E_T(\text{jet\#1}) < 70 \text{ GeV}$  and  $PT_{\text{maxT}} > 2.0 \text{ GeV/c}$ .

# Jet Multiplicity

- ➡ Shows the data on the **number of jets** (JetClu,  $R = 0.7$ ,  $|\eta| < 2$ ,  $E_T(\text{jet}) > 3 \text{ GeV}$ ) for “**back-to-back**” events with  $30 < E_T(\text{jet\#1}) < 70 \text{ GeV}$  and  $PT_{\text{maxT}} > 2.0 \text{ GeV/c}$ .
- ➡ Compares the (*uncorrected*) data with **PYTHIA Tune A** after CDFSIM.

# Jet Multiplicity

- ➡ Shows the data on the **number of jets** (JetClu,  $R = 0.7$ ,  $|\eta| < 2$ ,  $E_T(\text{jet}) > 3 \text{ GeV}$ ) for “**back-to-back**” events with  $30 < E_T(\text{jet\#1}) < 70 \text{ GeV}$  and  $PT_{\text{maxT}} > 2.0 \text{ GeV/c}$ .
- ➡ Compares the (*uncorrected*) data with **HERWIG (no MPI)** after CDFSIM.

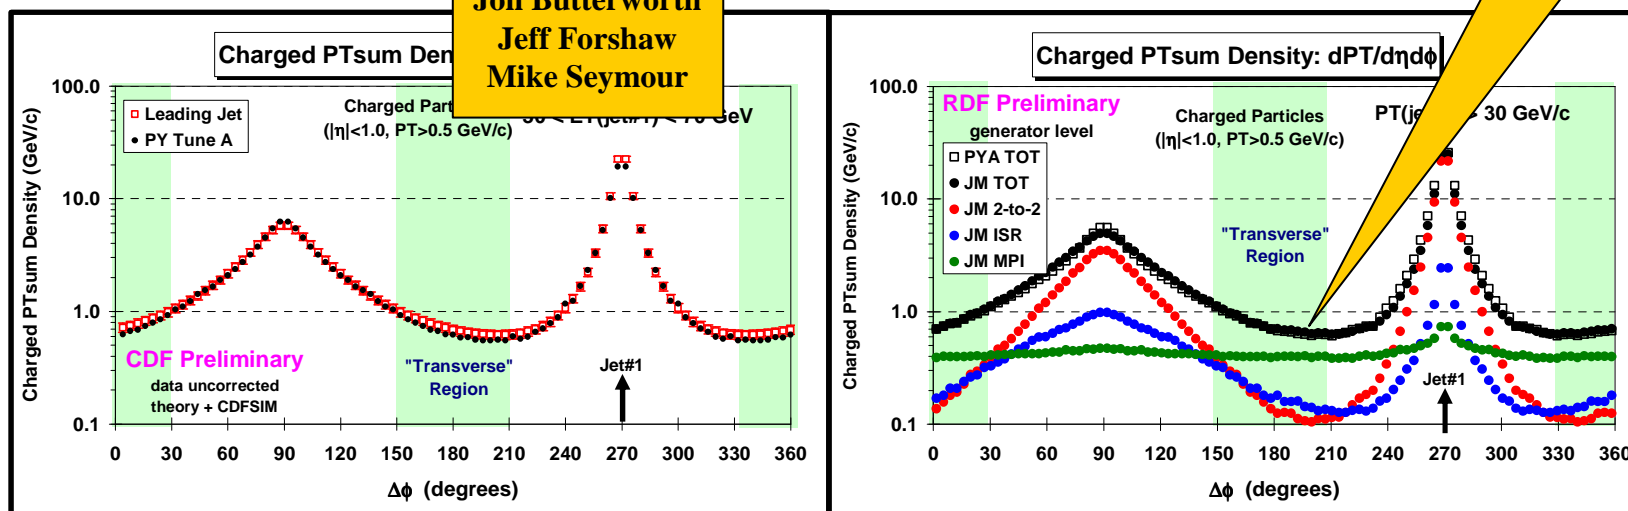

# Tuned JIMMY versus PYTHIA Tune A

Jon Butterworth  
Jeff Forshaw  
Mike Seymour

JIMMY tuned to agree with PYTHIA Tune A!

- ➔ (left) Shows the Run 2 data on the  $\Delta\phi$  dependence of the charged *scalar* PTsum density ( $|\eta| < 1$ ,  $p_T > 0.5$  GeV/c) relative to the leading jet for  $30 < E_T(\text{jet}\#1) < 70$  GeV/c compared with PYTHIA Tune A (after CDFSIM).
- ➔ (right) Shows the generator level predictions of PYTHIA Tune A and a tuned version of JIMMY ( $PT_{\min} = 1.8$  GeV/c) for the  $\Delta\phi$  dependence of the charged *scalar* PTsum density ( $|\eta| < 1$ ,  $p_T > 0.5$  GeV/c) relative to the leading jet for  $PT(\text{jet}\#1) > 30$  GeV/c. The tuned JIMMY and PYTHIA Tune A agree in the "transverse" region.
- ➔ (right) For JIMMY the contributions from the multiple parton interactions (MPI), initial-state radiation (ISR), and the 2-to-2 hard scattering plus final-state radiation (2-to-2+FSR) are shown.

# The New Forefront

- ➔ The forefront of science is moving from the US to CERN (Geneva, Switzerland).

- ➔ The LHC is designed to collide protons with protons at a center-of-mass energy of **14 TeV** (seven times greater energy than Fermilab)!

# Min-Bias “Associated” Charged Particle Density

- ➔ Shows the “associated” charged particle density in the “**transverse**” region as a function of  $PT_{max}$  for charged particles ( $p_T > 0.5 \text{ GeV/c}$ ,  $|\eta| < 1$ , *not including  $PT_{max}$* ) for “min-bias” events at 0.2 TeV, 1.96 TeV and 14 TeV predicted by PYTHIA **Tune DW** at the particle level (*i.e.* generator level).

## How can we measure the UE? Let's do what RICK did!

1st look at Back-to-Back Di-Jet Events in which the jet energies are relatively close so as to minimize radiation in transverse region.

- ➔ At **STAR** they have measured the “underlying event at  $W = 200$  GeV ( $|\eta| < 1, p_T > 0.2$  GeV) and compared their uncorrected data with PYTHIA Tune A + STAR-SIM.

# The ‘Underlying Event’ at STAR

RHIC

UK

## Conclusions

- I. Hadron Collisions at RHIC take place at an order of magnitude smaller  $\sqrt{s}$  than the Tevatron. Nevertheless, jets are observed and reconstructed down to  $p_T=5$  GeV and are well described by pQCD
- II. Comparisons between several jetfinders reveal consistent results
- III. Interest in the Underlying Event at RHIC Kinematics is driven by the need for jet energy scale corrections as well as pure physics interests (see talks by M. Lisa and H. Caines)
- IV. UE at RHIC appears to be independent of jet  $p_T$  and decoupled from hard interaction
- V. CDF Tune A provides an **excellent** description of the UE at  $\sqrt{s}=200$  GeV (thanks Rick!)
- VI. Underlying Event distributions in general smaller than those at CDF. Tower & Track Multiplicities are the exception, but this may be due to the 0.2 (STAR) versus 0.5 GeV (CDF)  $p_T/E_t$  cut-off.
- VII. For a cone jet with  $R=0.7$  UE contributes **0.5-0.9 GeV**.
- VIII. Comparison of Leading Jet and Back-to-Back distributions indicate that **large angle radiation contributions are small at RHIC energies**.

Energies are  
region.

## ➔ **Measure Min-Bias and the “Underlying Event” at CMS**

- The plan involves two phases.
- Phase 1 would be to measure min-bias and the “underlying event” as soon as possible (when the luminosity is low), perhaps during commissioning. We would then tune the QCD Monte-Carlo models for all the other CMS analyses. Phase 1 would be a service to the rest of the collaboration. As the measurements become more reliable we would re-tune the QCD Monte-Carlo models if necessary and begin Phase 2.
- Phase 2 is “physics” and would include comparing the min-bias and “underlying event” measurements at the LHC with the measurements we have done (and are doing now) at CDF and then writing a physics publication.

*National Taiwan University, Taipei, Taiwan*

R. Field

*University of Florida, FL, USA*

#### Abstract

We discuss a study of the "Underlying Event" at CMS (under nominal and start-up conditions) by measuring charged particles and momentum densities. The underlying event is studied by examining charged particles in the "transverse" region in charged particle jet production. The predictions of HERWIG (without multiple parton interactions) and several versions of PYTHIA (with different multiple parton interaction models) are compared and the possibility of discriminating between them is investigated. Exploring QCD dynamics in proton-proton collisions at 14 TeV and the importance of improving and tuning the QCD Monte Carlo models at the LHC start-up are discussed.

CMS underlying event and double parton scattering tunes

The CMS Collaboration

### Abstract

Three new PYTHIA-8 underlying event (UE) tunes are constructed, one using the CTEQ6L1 parton distribution function (PDF), one using HERAPDF 1.5 leading order (LO), and one using the NNPDF2.3LO PDF; two new PYTHIA-6 UE tunes, one for the CTEQ6L1 PDF and one for the HERAPDF 1.5 LO, and one new HERWIG ++ UE tune for the CTEQ6L1 PDF are also available. Simultaneous fits to CDF UE data at 300 GeV, 900 GeV, and 1.96 TeV, together with CMS UE data at 7 TeV, check the UE models and constrain their parameters, providing thereby more precise predictions for proton-proton collisions at 13 TeV. In addition, several new double-parton scattering (DPS) tunes are investigated when the values of the UE parameters from fits to observables are consistent with the values determined from fitting DPS-sensitive observables. Also examined is how well the new UE tunes predict "minimum bias" (MB) events, jet and Drell-Yan ( $q\bar{q} \rightarrow Z/\gamma^* \rightarrow \text{lepton-antilepton+jets}$ ) observables, as well as the MB and UE observables at 13 TeV.

## A Study of the Energy Dependence of the Underlying Event in Proton-Antiproton Collisions

The CDF Collaboration

August 2, 2015

### Abstract

We study charged particle production ( $p_T > 0.5 \text{ GeV}/c$ ,  $|\eta| < 0.8$ ) in proton-antiproton collisions at 300 GeV, 900 GeV, and 1.96 TeV. We use the direction of the charged particle with the largest transverse momentum in each event to define three regions of  $\eta$ - $\phi$  space: "toward", "away", and "transverse". The average number and the average scalar  $p_T$  sum of charged particles in the transverse region are sensitive to the modeling of the "underlying event". The transverse region is divided into a MAX and MIN transverse region, which helps separate the "hard component" (initial and final-state radiation) from the "beam-beam remnant" and multiple parton interaction components of the scattering. The center-of-mass energy dependence of the various components of the event are studied in detail. The data presented here can be used to constrain and improve QCD Monte Carlo models, resulting in more precise predictions at the LHC energies of 13 and 14 TeV.

The goal is to produce data (corrected to the particle level) that can be used by the theorists to tune and improve the QCD Monte-Carlo models that are used to simulate hadron-hadron collisions.

# “Tevatron” to the LHC

My dream!

Mapping out the Energy Dependence of the UE

(300 GeV, 900 GeV, 1.96 TeV, 7 TeV, 13 TeV)

# “Tevatron” to the LHC

My dream!

**Fake data** generated by Rick using the Monash tune with the statistics we currently have at CMS!

Mapping out the Energy Dependence of the UE

(300 GeV, 900 GeV, 1.96 TeV, 7 TeV, 13 TeV)

# “Tevatron” to the LHC

My dream!

**13 TeV** UE data  
coming soon  
from both  
ATLAS and  
CMS!

Mapping out the Energy Dependence of the UE

(300 GeV, 900 GeV, 1.96 TeV, 7 TeV, 13 TeV)
