Main example Geometric Lorenz attractor.

First Case: Expanding

Second Case: Contracting

(1) from the topological point of view.

(2) from the statistical point of view.

We start recalling these attractors.

Lorenz attractor

Lorenz (1963) exhibited a 3-dimensional o.d.e. whose solutions seemed to depend sensitively on the initial point.

Lorenz equations:

$$X(x, y, z) = \begin{cases} \dot{x} = 10 (-x + y) \\ \dot{y} = 28 x - y - xz \\ \dot{z} = -\frac{8}{3} z + xy \end{cases},$$

The classical parameters are : $\alpha=10,\ \beta=28,\ \gamma=8/3$.

◆□▶ ◆□▶ ◆三▶ ◆三▶ ● □ ● ●

Lorenz Conjecture

The flow generated by the equations above contains a volume zero attractor Λ that is sensitive with respect to initial data.

Solution of Lorenz Conjecture

The **solution** of this conjecture was given by **Tucker**, at the year 2000, under the advisor of L. Carleson. He combines normal form techniques nearby the singularity and computer assistence techniques far from singularity.

Meanwhile, it was introduced a **geometric model** for this attractor, that satisfies all all the predictions by Lorenz, that we present very briefly in the sequel.

Geometric Lorenz attractor

Introduced by GW and ABS in the seventies to model the flow generated by the Lorenz' equations.

Geometric Lorenz attractor

Introduced by GW and ABS in the seventies to model the flow generated by the Lorenz' equations.

Expanding Geometric Lorenz attractor

The eigenvalues satisfy the condition

Main hypothesis

Existence of a contracting foliation \mathcal{F}^s for the Poincaré map

$$P: \Sigma \to \Sigma; \quad \Sigma = S^- \cup \Gamma \cup S^+$$

《曰》 《聞》 《臣》 《臣》

王

The quotient map

The quotient map $f: I \to I$ associated to \mathcal{F}^s :

f is increasing, $|f'| > \sqrt{2}$ where it is defined and $|f'(0_{\pm})| = \infty$.

◆□▶ ◆御▶ ◆臣▶ ◆臣▶ 臣 の�?

f is increasing, $|f'| > \sqrt{2}$ where it is defined and $|f'(0_{\pm}) = \infty$.

 \Downarrow

The maximal invariant set Λ_f is a transitive attractor for f.

4. Theorem $d_{\mu}(x) = d_{\mu_F}(x) + 1.$

Recall: decay of correlation $F: \Sigma \to \Sigma$: a first return map to Σ , a cross section to X^t . The map F has exponential decay of correlations: $\exists C > 0, \lambda < 1$ such that $\forall n > 1$ it holds

 $\left|\int g(F^{n}(x)) \cdot f(x)d\mu - \int f(x)d\mu \cdot \int g(x)d\mu\right| \le C\lambda^{n}.$

◆□> ◆□> ◆三> ◆三> ● 三 のへで

Main difficult: F has exponential decay

Ingredient:

The Wasserstein-Kantorovich distance defined as follows:

Given two probabilities on $M,\,\mu_1$ and $\mu_2,$ the W-K-distance is

$$W(\mu_1, \mu_2) = \sup_{g \in Lip_1(M)} \left(\left| \int_M g d\mu_1 - \int_M g d\mu_2 \right| \right)$$

《曰》 《聞》 《臣》 《臣》 三臣 …

 $Lip_1(M)$: the space of 1-Lipschitz maps on M.

W-K distance versus decay

Proposition 1. (decay in function of distance) Let $\mu_1 \ll \mu$ and $d\mu_1 = f(x)d\mu$. Then, for $g \in Lip_1(M)$ we have

 $|\mathcal{C}_n(g,f)| \le L(g) \cdot ||f||_1 \cdot W((F^*)^n(\mu_1),\mu).$

◆□▶ ◆□▶ ◆注▶ ◆注▶ 注 のへで

W-K distance versus decay

Proposition 1. (decay in function of distance) Let $\mu_1 \ll \mu$ and $d\mu_1 = f(x)d\mu$. Then, for $g \in Lip_1(M)$ we have

 $|\mathcal{C}_n(g,f)| \le L(g) \cdot ||f||_1 \cdot W((F^*)^n(\mu_1),\mu).$

Proposition 2. (distance in function of decay) Assume that for each $f \in L^1(\mu)$ and $g \in Lip_1(M)$ it holds:

 $|\mathcal{C}_n(g,f)| \le C \cdot \|g\|_{Lip_1(M)} \cdot \|f\|_{L^1(\mu)} \cdot \Phi(n).$

◆□> ◆□> ◆三> ◆三> ● 三 のへで

Then, taking $d\mu_1 = \frac{f}{\|f\|_1}$ with $\int f(x)d\mu = 1$ we get

W-K distance versus decay

Proposition 1. (decay in function of distance) Let $\mu_1 \ll \mu$ and $d\mu_1 = f(x)d\mu$. Then, for $g \in Lip_1(M)$ we have

 $|\mathcal{C}_n(g,f)| \le L(g) \cdot ||f||_1 \cdot W((F^*)^n(\mu_1),\mu).$

Proposition 2. (distance in function of decay) Assume that for each $f \in L^1(\mu)$ and $g \in Lip_1(M)$ it holds:

 $|\mathcal{C}_n(g,f)| \le C \cdot \|g\|_{Lip_1(M)} \cdot \|f\|_{L^1(\mu)} \cdot \Phi(n).$

Then, taking $d\mu_1 = \frac{f}{\|f\|_1}$ with $\int f(x)d\mu = 1$ we get

 $W((F^*)^n(\mu_1),\mu) \le 2 \cdot C \cdot \Phi(n).$

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへで

W-K dist. versus disintegration

Proposition 3. Let μ^1 and μ^2 be invariant for (F, Σ) s.t.

•
$$\mu^1(A) = \int \mu^1_{\gamma}(A \cap \gamma) d\mu^1_x$$
,

•
$$\mu^2(A) = \int \mu_\gamma^2(A \cap \gamma) d\mu_x^2$$

with μ_x^i having bounded variation density. Also,

(1) for each
$$\gamma \in \mathcal{F}^s$$
, $W_1(\mu_\gamma^1, \mu_\gamma^2) \leq \epsilon_s$

(2)
$$\sup_{\|h\|_{\infty}} \left| \int h d\mu_x^1 - \int h d\mu_x^2 \right| \le \delta.$$

Then

$$W(\mu^1, \mu^2) \le \epsilon + \delta.$$

(Σ, F, μ) is fastly mixing

On opposition to the robustness of a Lorenz attractor, the Rovella attractor is not robust .

Comments on Rovella attractor

The map f_0 is chaotic and not stable, since it is accumulated by maps which have periodic attracting orbits.

On opposition to the robustness of a Lorenz attractor, the Rovella attractor is not robust .

But, it persists in a measure theoretical sense: there exists a one-parameter family of positive Lebesgue measure of C^3 close vector fields to X_0 , the starting vector field, which have a transitive non-hyperbolic attractor.

Log law for Rovella attractor

Follow the same steps as before.

Main difficult: prove exponential decay for the Poincaré map.

This time $F: \Sigma \to \Sigma$ is a skew-product with non-expanding base map $f: I \to I$.

Thus, we have to improve the arguments. We follow a general principle: the statistical properties of a skew product are obtained from the statistical properties of the base map. To do so we proceed as follows.

《曰》 《聞》 《臣》 《臣》 三臣 …

Convergence to equilibrium

Definition We say that (f, μ) has exponential convergence to equilibrium with respect to a reference measure ν and norms $\|.\|_a$ and $\|.\|_b$, if there are $C, \Lambda \in \mathbb{R}^+$, $\Lambda < 1$ such that for $f \in L^1(\nu), g \in L^1(\mu)$ and all $n \ge 1$ it holds

$$\left|\int f \cdot (g \circ T^n) \, d\nu - \int g \, d\mu \int f \, d\nu\right| \le C\Lambda^n \cdot \|g\|_a \cdot \|f\|_b.$$

Definition Let $Q = I \times I$ and $f : Q \to \mathbb{R}$ is integrable, we denote by $\pi(f) : I \to \mathbb{R}$ the function

$$\pi(f): x \mapsto \int_I f(x,t) dt.$$

(日) (문) (문) (문) (문)

Skew product, base having exp-conv to equilibrium

Theorem Let $F: Q \bigcirc, F(x,y) = (T(x), G(x,y))$. Let μ be *F*-invariant measure with bsolutely continuous marginal μ_T on the *x*-axis which, moreover, is *T*-invariant. Suppose that

- $\begin{tabular}{ll} \hline (T,\mu_T) \mbox{ has exponential decay of correlations with respect to the norm $\|\cdot\|_{\infty}$ and to a norm denoted by $\|\cdot\|_{-}$. } \end{tabular}$
- 2 T: nonsingular resp to Lesbegue, piecewise continuous, monotonic: $\cup I_i = I$, T: homeo onto its image.
- **3** G is λ -Lipschitz in y with $\lambda < 1$.

Then (F, μ) has exponential convergence to equilibrium with respect to $\nu = \mu_T \times m$ (the product of the a.c.i.m of T and the Lebesgue measure).

Exp-conv to equilibrium

In the following sense:

There are $C, \Lambda \in \mathbb{R}^+, \ \Lambda < 1$ such that

$$\begin{split} \left| \int f \cdot (g \circ F^n) \, d\nu - \int g \, d\mu \int f \, d\nu \right| \leq \\ C\Lambda^n \cdot \|g\|_{\ddagger lip} \cdot (||\pi(f)||_{-} + ||f||_1) \\ \text{r each } f > 0. \end{split}$$

< □ > < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□) < (□

 (\star) Further, extract the right properties from the base map of the skew product arising from the Rovella attractor.

The base map is not piecewise increasing anymore.

(*) The main technical problem is transform the information we have about the base map (exponential decay with respect to Holder and L_{∞} observables) into information about decay of correlation respect to generalized bounded variation observables.

The Rovella skew product $F: Q \bigcirc$

- (a) F(x,y) = (T(x), G(x,y)) (preserves vertical foliation), (b) $\exists c \in I, k \ge 0$ s.t. if $c \notin [x_1, x_2]$ then $\forall y \in I : |G(x_1, y) - G(x_2, y)| \le k \cdot |x_1 - x_2|$,
- (c) $F|_{\gamma}$ is λ -Lipschitz, $\lambda < 1$ on each leaf γ ,
- (d) T is onto, x = 0 is a discontinuity, piecewise C^3 , two branches, $\mathcal{O}(T'(0)) = s 1 > 0, T'(x) > 0 \ \forall \ x \neq 0$,
- (e) $\max_{x>0} T'(x) = T'(1)$ and $\max_{x<0} T'(x) = T'(-1)$,
- (f) 1 and -1 are pre-periodic repelling,
- (g) T has negative Schwarzian derivative: $S(T) < \alpha < 0$.

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

Main Theorem

Theorem $F: Q \bigcirc$ satisfying properties (a)–(g) above. Then the unique SBR measure μ_F has exponential decay of correlation respect to $\mathbb{B}(1, \alpha)$ and L^{∞} observables, that is, there are $C, \Lambda \in \mathbb{R}^+$, $\Lambda < 1$, such that

$$\left|\int f \cdot (g \circ F^n) \, d\mu_F - \int g \, d\mu_F \int f \, d\mu_F \right| \le C\Lambda^n \|g\|_{L^\infty} \|f\|_{\mathbb{B}(1,\alpha)},$$
